THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII., No. 4236. NEW YORK, JANUARY 3, 1914. WEEKLY $1.00 PER YEAR.

THE CROPS FOR ACID SOILS.

Why the Land is Sour.

PART I.

For the past 20 years a good share of our farm-teaching efforts at the East has been devoted to trying to make misfit crops feel at home. In the northeastern part of this country the soil is naturally acid, yet we have been working on the proposition that clover, Alfalfa and similar crops, which belong to an alkaline soil, should be made the foundation of our farming. This is responsible for the immense use of lime, which is growing all over the Eastern States. Our soil is naturally acid, and unless it be artificially sweetened by the use of lime, such crops as clover, wheat, Alfalfa and Timothy will not thrive. Where lime is cheap the practice is wise and economical. There are some localities where lime, laid down on the farm, is expensive, and in these cases it may be better economy to give up the effort to neutralize the soil with lime, and use crops which are naturally adapted to acid soils. Some of these crops are rye, vetch, cow peas, Red-top, and some varieties of flint corn.

Some of the most interesting experiments of recent years are those conducted by Prof. Frederick V. Coville. A few years ago Professor Coville found that the blueberry would not thrive except in an acid soil. Most of our cultivated plants fail when the ground is sour, because nitrification does not go readily on, and thus there is a lack of available nitrogen. Professor Coville started out to find how the blueberry could find the food under such conditions. This led to a further study of acid soils and the reasons for their acidity.

What makes land sour? One chief reason is the decay of vegetable matter, especially in soils which are naturally deficient in lime. Professor Coville found that blueberries grew successfully in very acid soils which were composed chiefly of rotted oak-leaves. The fresh oak leaf contains so much acid that it is by comparison one-third as sour as pure lemon juice. Of course we know that most of our ordinary farm crops—except perhaps cranberries and strawberries—could not grow in a soil as sour as this. Notice how the grass, especially Timothy or Blue grass, dries when fresh leaves fall from the trees and decay upon the lawn. Now since the blueberry did so well in this partly decayed oak-leaf soil, Professor Coville assumed that the plant would do still better in leaf mold which had been fully decayed. So blueberry plants were started in oak-leaf mold which had been rotting for five years. But the plants failed to grow—were practically ruined, very inferior as compared with plants started in the sour oak-leaves. Yet with Alfalfa and rose cuttings there were exactly opposite results—these in the rotted leaf mold made luxuriant growth, while those in the fresh leaves showed that they were starving. Here we have the basis for a new scientific study of the soil. What is the difference between the fresh oak-leaves and the decayed leaf mold? How can the blueberry plants extract plant food and grow well where Alfalfa starves? Most of us know that rye and Red-top will make a fair growth on soil which is so sour that wheat and Timothy will fail. Here we have been taught that bacteria are needed to break up organic matter and provide plant food. These bacteria need an alkaline soil to do their best work, and as acidity increases they stop working. Yet we find that blueberry plants make a good growth in soil even more sour than picnic lemonade! How do they do it?

A PAIR OF OHIO FARM BEAUTIES AND THEIR REFLECTION IN THE POND. FIG. 1.

Here comes one of the strangest things connected with the study of soils. Fresh fallen leaves from our common trees are full of acid. The following table shows comparatively how sour they are. This table gives the number of tons of lime which would be needed to neutralize the acid in a layer of forest leaves covering one acre six inches deep.

TABLE I.—Acidity of freshly fallen leaves, in terms of lime requirement per acre.

Kind of leaves.	Acidity.	Kind of leaves	Acidity.
	Tons.		*Tons.*
White oak	25	Sugar maple	22
Red oak	16	Tulip tree	14
Silver maple	22	Virginia pine	22

The oak leaves contain so much acid that they are

one-third as sour as pure lemon juice. All farmers who have cleared off woodland know that rye and buckwheat do better as first crops than wheat or oats. It is common remark, too, that potatoes on this new woodland soil are always remarkably free from scab. We know that the scab germ cannot develop well in a sour soil. Yet after a time wheat and Timothy do better, and scab appears on potatoes. How does it happen that this soil, originally sour from the tree leaves, slowly grows sweeter?

Strange as it may seem, these leaves, though so sour, contain considerable quantities of lime. The following table shows how much lime some of them contain:

TABLE II.—Percentage of lime in freshly fallen leaves, in terms of calcium carbonate, or ground limestone.

Kiud of leaves.	Percentage of lime.	Kind of leaves.	Percentage of lime.
White oak	1.12	Sugar maple	4.56
Red oak	3.08	Tulip tree	5.06
Silver maple	3.31	Virginia pine	.16

Here is a curious thing. Soils containing as much lime would be considered alkaline, yet, as stated, some of these leaves are much sourer than lemonade. Professor Coville shows that this lime does not exist in the form of actual calcium oxide. It is combined with the acids in the leaf, but there is not enough of it to fully neutralize them. Thus the leaves of the silver maple are nearly as sour as lemon juice, while they contain over three per cent. of lime. Now these acids are organic and, as decay slowly goes on, these acids are disorganized and pass away as gas and liquids. The lime, however, remains, and as the acids pass off, of course the remains of the leaves are alkaline. This accounts for the fact that the blueberry, an acid soil plant, does well in the sour soil, but fails when the acids have worked out of it, while the reverse of this is true of the Alfalfa.

Professor Coville shows how soils, naturally poor in lime, may, when cleared of the forest, show for 25 years or more lime in the upper soil and considerable fertility. Trees and large plants in such soils concentrate lime at the surface. They draw this lime through their roots from deep down in the soil and store it up in their leaves. These fall filled with acid and accumulate upon the ground. The acids pass off and leave the lime, which thus slowly accumulates in the upper soil—transferred from below through the trees. That is why the timber lands in our Eastern States are found to be fertile when first cleared, though upon soils which are known to be naturally deficient in lime. After some years of cropping this lime in the surface soil fails, and there being little more to take its place the soil grows sour. This is evidently the history of many of our Eastern soils which have grown non-productive in these crops which demand alkaline conditions. Farmers who handle such soils must use lime in order to sweeten them, or plant the crops which are naturally suited to acid soils. There are crops which have the power to obtain their food under acid conditions. We shall consider them next.

FARMING ON SHARES.

This is the first of several articles on the relations between landlord and tenant. The statements here given are correct—the outcome being probably better than the average tenant receives. The landlord's side will also be given. Every turn makes it more evident that the greatest need is some plan which will permit a good tenant farmer to own and stock a farm.

For two years I have been working a farm on shares. The farm was in a run-down condition, not furnishing enough to keep the stock. The owner lives on the farm, is well fixed financially, and although our methods and opinions differ we have no quarrels. I knew this place didn't pay well, but there were so many things being done haphazard that it seemed as if a better management would make better pay. April 1st I took possession, and soon had my hands full, too. The cows were a mixture of all the breeds the country could produce. They were in a half-starved condition, some of them so weak they could hardly stand. My first move was to buy grain for them. The owner said they had never been grained before, but didn't object to standing half the feed bill.

The plowing all had to be done and the manure all got out, so I was late getting the crops in the ground. The owner buys all grass seed and lime, and furnishes one-half the other seeds. I plowed deep, turning up soil that hadn't seen daylight before in years. I sowed lime on the new seeding and had good crops, all but hay; that was light and poor quality. The new seeding was good. The veals went to market clean and in pretty good condition. The milk goes to a cheese factory. It cannot be sold in the city because the barns won't stand inspection.

In the Fall I prevailed on the owner to sell off some of the poor cows; by so doing I had enough to keep the rest without buying anything but grain. A small amount of grain seemed to go farther with these cows than it does with cows that are in the habit of being grained, but a cull cow hasn't the capacity for a big flow of milk. Feed her a big amount of grain and she is more apt to take on fat than to give more milk.

The Spring I took the place there had to be a bull bought. The owner asked my advice concerning what breed would be best. I thought here was my chance to improve the herd, and, considering the cows were mostly large, some black and white, some blue roans, and but one Ayrshire and one part Jersey, I advised a Holstein. After a few days the owner informed me the bull was bought and I was to go after him. He was a purebred Holstein bull calf three days old. Shortly after this a scrubby yearling bull was bought to head the herd till the purebred grew up from calfhood. There were no hogs kept, so I bought two pigs, the owner paying for one. We each furnish one-half the feed. Of course all the work comes to me—butchering, marketing, etc. I get one-half. At the end of the first year, when I figured up, I find this place has turned me in money less than one dollar a day. The owner said: "Well, by the time my taxes are paid, grass seed and lime and one-half the other seeds, one-half the grain bill paid, I'm afraid I won't have the interest on my money invested."

WHERE PACKING IS DONE. Fig. 2.

PACKING TABLE. Fig. 3.

Now of course I have my team nearly kept, a house to live in and gas to burn, an average of one quart of milk a day, about 20 pounds of butter made in the Winter, potatoes and some apples. But out of this $323 I have to pay my hired help, buy one-half the grain for cows, buy one-half seed corn, seed potatoes, millet and oats, pay the thrashing bills and hire a binder. This year I have done no better; 90 days between killing frosts cut down the green fodder, and the hay was very light. What is the trouble? My wife and I work hard, live as economically as we can, and moreover are giving good satisfaction. That I haven't got in debt is a wonder. But it seems to me that any farm with an average of 12 head of cows, vealing all calves but two a year, and selling dressed hogs ought to do better than that.

BOXING THE FRUIT. Fig. 4.

The farm is in better shape than when I took it. The stock can be kept without buying hay. The manure has been hauled directly on the fields; they being nearly level there isn't any waste, where before it had been wheeled out behind the barn till Spring and then hauled to a field and piled up in a great heap in some corner to rot, and it usually did right there. The barns are clean and warmer, a heater put in the watering trough, and the fences improved till the cattle actually stay in their own pastures. Several people have applied for this place the coming year, where two years ago no one wanted it but me. And I have been climbing over the fence in the same length the gate was in ever since I came here. When I leave here next Spring I shall have a heifer (from one of these great cows) and a good grade yearling that I bought to take with me, also experience.

Lack of capital has prevented my raising paying crops, such as potatoes, for all of my time had to go to raising forage for these cattle. I wanted to do the farming in a more modern way, but the owner objected, and, as I said in the beginning, we have had no quarrels, but I would like sometimes to get the owner to the cow barn in hearing of the cows and express my mind fully. I am done farming on shares. When I work another farm it will be one I have bought and run in debt for. Take the one-half you have been handing your landlord and pay your taxes out of it and such improvements as you must have; you ought to have a few dollars to pay on your place; but don't take a farm to work on shares that has more cows than it can support. Better that the owner of the place has to depend on it for a living, for then they are interested and see the necessity of improving. But this one says, "Go ahead and improve all you want to, but don't make me pay for it." E. D.

THE USE OF RAW ROCK PHOSPHATE.

In looking over some old copies of THE R. N.-Y. I found an article on page 400 year 1909, in regard to raw rock phosphate, which goes to show that this material is of small benefit, and that manure does not make the phosphate available. If this is true I am in for it, as I have a carload (delivered last Spring) and a 20-acre field covered (before silage corn) with manure and raw rock at rate of 600 pounds per acre, 15 loads manure per acre. This was sod, Spring plowed, sandy loam. Corn was drilled three feet apart, six inches in row. The dry weather fired it at the bottom quite a little and otherwise damaged the growth through lack of moisture, so I cannot know if phosphate helped either way. I have finished plowing this for oats and potatoes next Spring, and have been hoping for great things from manure and phosphate. Can you tell me whether I hope in vain? Are your sources of information giving out the same statements now? Prof. Hopkins of Illinois Experiment Station seems to consider this material the proper stuff to use now in preference to high-priced available fertilizers. J. R. B.
Middle Grove, N. Y.

It is true that we reported four years ago some experiments in which it was shown that mixing the raw phosphate with manure did not make the phosphate "available." Since that time many other experiments have been made both East and West, yet the controversy is still open. Most of our expert scientists at the East seem to agree that on our thinner acid soils and with our special crops it pays better to use an "available" form of phosphoric acid like acid phosphate or bone. As a rule, they are not enthusiastic over raw phosphate. On the other hand, a number of farmers are using the rock phosphate and speak highly of it. When we get them down to facts they cannot really show results, but anticipate them in the future from what *ought to be*. On the other hand, it seems to be settled that in parts of Illinois, and perhaps in Ohio and Wisconsin, the raw rock has given definite and evident results. It does not seem possible that the Experiment Station of Illinois would continue to advocate this rock phosphate as it does unless it were now sure of its ground. So far as we can learn, the best results are obtained on soils rich in humus and highly manured and naturally deficient in phosphorus.

Across the river from Illinois, in Missouri, quite different results are noted. In that State good farmers tell us frankly that they have not been able to secure anything like the returns from rock phosphate which are mentioned by the Illinois Experiment Station. They find after fair trial that the more soluble forms of phosphoric acid, like bone meal and acid phosphate, have proved more profitable; yet there are cases where raw phosphates have done remarkably well. The difference in these results is ascribed to the fact that some soils, and particularly some in Illinois, are not only low in natural phosphates, but are high in organic matter. Of course, a soil naturally low in phosphates is one upon which the rock phosphate would be expected to give best return. On the other hand, a soil naturally supplied with phosphates, but low in organic matter, would give more profitable and quicker results with the available phosphoric acid. Thus we think the Missouri Experiment Station, as a general proposition, recommends the use of raw phosphate chiefly for farmers who own their own land, and who either grow cover crops or turn under a rich clover sod. The man who owns his own farm can afford to wait for slow results from the raw phosphate. If he is a tenant he would be more likely to obtain immediate results from the acid phosphate or bone. We think that this is a fair statement of the situation. We do not believe that our friend will lose anything from his use of the raw phosphate rock. He may be obliged to wait some years to obtain a fair showing.

PACKING BOXED APPLES.

Methods on an Eastern New York Farm.

Our crop amounted to about 1,800 barrels, the bulk ot which was sold in barrels at a satisfactory figure, graded into two sorts: each grade to be strictly uniform, all culls, wormy fruit or otherwise unfit was sold to the cider mill. Our system of packing may not strictly conform to rules laid down by agricultural colleges, but I found it answers very nicely when selling to private trade or to stores in our neighborhood. I had no college training, but had to learn by experience and observation.

GATHERING AND SELECTING.—I had from eight to 10 pickers at work, all Italians, who are about the only day labor to be had around here, and who will do very nicely if instructed right and kept under constant and strict supervision. This I did myself, and while doing it I employed my time by sorting out the perfect fruit as to size and color, by taking them out of the barrel after each basket emptied by a picker. This fruit I placed in boxes, putting paper between each layer of apples. These boxes we hauled every evening to cellar and stored them away till wanted for packing. The main points in this work are: Look well after the pickers, so that as little fruit as possible or none at all is bruised. Select only fruit perfectly clean, sound and of good color; size does not count so much, as we find a market for some small fruit as well as large, provided it is perfect.

GRADING AND PACKING.—We use standard bushel boxes, same as are used in every market, which can be bought as cheaply as barrels from different commercial houses, together with layer paper, lining paper and wrappers in different sizes. My packing table is 3x4½ feet, 30 inches high, and divided into three compartments, each either to hold one different size of the same variety of fruit, or to hold different varieties of same size in each. We grade all fruit into three grades except Greenings, where we only make two. I put two deep shelves under the table to hold layer paper, lining paper, wrappers, box covers, etc., and one shelf on top for tools, stamps, cards, order blanks, etc., so I have everything handy where it is wanted. The grading of the fruit can be done in two different ways, either on rainy days by emptying boxes gently on a sorting table, grading back into boxes and marking each; or by taking them, when ready for packing, direct to packing table and grading into the three different compartments. The table is 3x4 feet, four pieces, 2x4x 30 inches, for legs; four pieces of either 1½ or 2x4 inches for frame; a piece of strong burlap or canvas stretched over frame, three boards nailed to either sides and back, and it is finished. I nailed two extra strips 1½x4 inches, front and back, extending 18 inches on both sides; nailed two boards on top, and have a handy shelf on either side of table for three baskets, or box and basket. I don't like a wooden table; canvas protects fruit from being bruised.

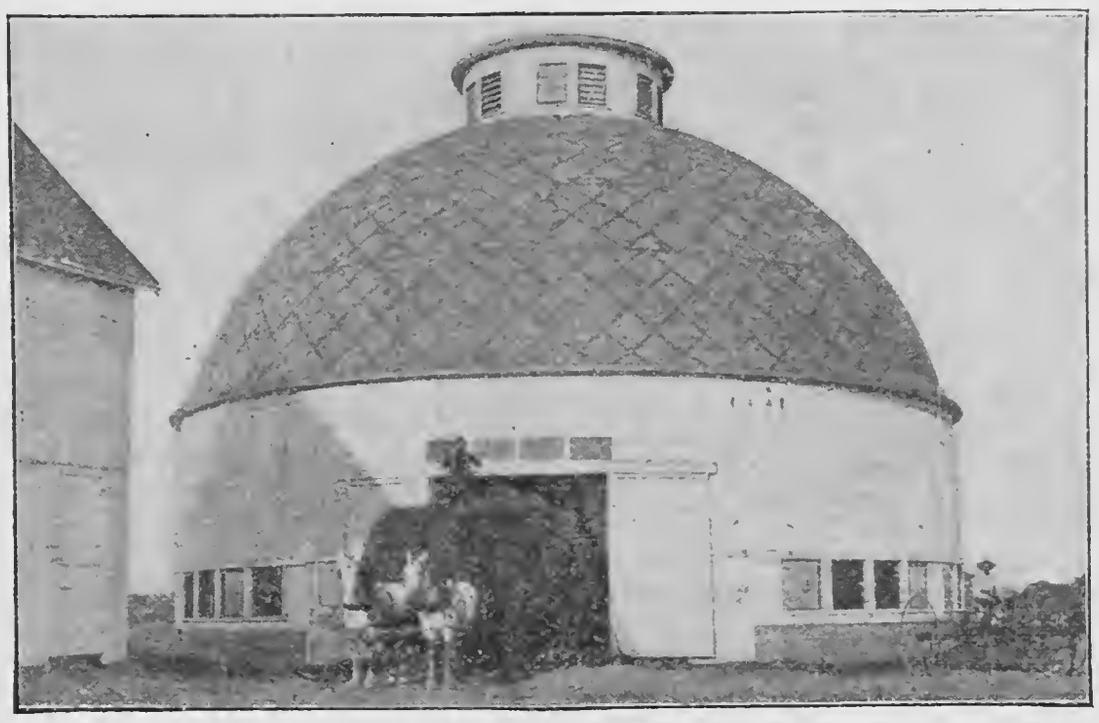
PACKING THE BOX.—I place box to my left side, pitching toward me at about 20 to 30 degrees; put piece of layer paper in bottom, line both sides with lining paper, the ends hanging over sides six to eight inches, which are turned in and protect top after box is filled. Our standard grade is 96 apples to a box, 24 to a layer, four layers to a box; every apple is wrapped in paper and placed in box, stem up. A paper is placed between each two layers. This way of packing is, I believe, the most approved one; but you will find it often hard to have 24 apples exactly of the size to fit the box so as to make a very tight and close pack, which must be done, and I therefore place now and then one apple "side up," when packing to private trade. I did this for some years, and never had a complaint, as the main point for the customer is size and quality. I also use apples slightly larger toward middle of box, so that I will have, when finished, a well-rounded box, showing a bulge on top, bottom and sides; it is well filled and tight, which is wanted. We also sell quite a number of assorted boxes; that means either two or three different varieties in one box, size about uniform, or two or three different sizes in box of same variety; but this is only done when so ordered by a customer. Our principle is to give him what he wants and, if possible, the way he wants it.

When packing for store trade, we employ a different packing. I wrap one apple, leave next one exposed, and so on till finished, the apples to be as even in size and color as possible. My reason for doing this is, it shows the fruit off well, enables the customer to see the fruit without having the storekeeper unwrap half a dozen apples to show and then dropping them back into box, tumbling the packing all to pieces and spoiling the looks of it. This way of packing helps him and me by making it easier for him and helping us in advertising the fruit. By packing grades of apples smaller than 96 to a box I find it often to advantage by placing fruit "sides up" into box, making thereby a closer and better pack, and it looks fully as well as with all stems up.

After box is filled an advertising card and order blank is placed on top, covered with one layer paper, both sides of overhanging lining paper turned in and top nailed down. We stamp all of our boxes with our trade mark, which is also printed on our wrappers, and adds greatly to the appearance. It is also a constant reminder to the customer when unwrapping an apple where it came from, and to order more if he is satisfied.

A lot of fruit is sold in boxes to-day, coming mostly from the West, where they raise apples of the finest size and color; but the East is able to raise apples of much better flavor and quality; so we should work and improve size and color by cultivation, proper pruning, spraying and thinning of fruit, which, I am sure, can very well be done. A nicely packed box of good sound apples sells as well, and often better, than a barrel of poorly grown and packed fruit, and it is a credit to the grower, while the latter one is a disgrace. As farmers get in closer touch with the consumer, they will appreciate this point more fully. In barrels slack packing is responsible for a good deal of trouble. Many who can grow good apples do not realize the uniform excellence required in boxed fruit. The purchaser of boxed apples has been educated by the fine Western fruit, which sets our pace. CARL KOEHN.

Westchester Co., N. Y.



A MAINE FARMER'S ROUND BARN. FIG. 5.

(See page 23.)

FITTING AN ABANDONED OLD MEADOW.

Late in the Fall of 1911 I plowed about four acres of abandoned old meadow-land that had become first pasture, then brush, and finally small wood; and it is again well on the way toward meadow. I think my process was probably too slow for most people, but I firmly believe it was more economical than a quicker one would have been. This land had been cropped about 25 years ago, but not seeded down, and had a lot of stones on top of the ground; these were loosened with a pick and drawn away with a one-horse dump cart before plowing. The condition of the land rendered a decent job of plowing impossible, but we did the best we could, and left it in the furrow without any harrowing, so as to have it freeze and thaw as much as possible. At odd times we drilled and dynamited all the rocks that would interfere with the mowing machine in the future, and then left it alone till September, 1912, when it was harrowed with the disk and spike-tooth harrows. This produced an enormous crop of stumps and stones, which were taken off with the dump cart; the blasted rocks were drawn off and the land seeded to rye.

In the Spring of 1913 this rye was turned under, and after a lot of harrowing was planted to fodder corn, except about an acre, which was planted to Delaware potatoes. It was a pretty hard proposition to cultivate, but we went through the corn six and the potatoes nine times, and each time made it better. The fodder corn was a good crop for the season, and rye was sown before the last cultivation, in preparation for potatoes next year. The potatoes were thoroughly hoed twice, kept sprayed in good shape, and dug the second week in October, and produced 237 bushels from 14 bushels of seed. This was a remarkable crop here this year, as we suffered from a terrible drought all Summer. Lots of crops in this section did not produce over 40 to 50 bushels to the acre. Before cultivating these potatoes the last time buckwheat was sown broadcast all over the piece, and at digging time had mellowed it wonderfully. The land was harrowed and sown to Winter wheat and Timothy as soon as possible after digging, and then after taking off 60 cart-loads of small stones and brush roots we rolled it. It has taken two years to get this land where we have it; it has been plowed twice to get one crop, and we have spent a lot of time getting off stumps and stones, which is a pretty slow, expensive process. But the potato land that is sown to wheat was ground to dust before it was rolled, and this could not have been done by a quick process, as it takes time to rot old sod; and I believe the action of the weather on these roughly plowed furrows was fully equal to another plowing and harrowing, and it cost nothing except a little patience. The rye and buckwheat did good work, added a lot of humus to the land and cost very little. I would therefore advise anyone wishing to break up tough, brushy land to make good use of Jack Frost, sow cover crops liberally, and get the rocks off before planting crops. I used 500 pounds of fine bone and 300 pounds of potash on the rye, 1,000 pounds of commercial fertilizer on the corn, and 1,000 pounds on the potatoes. This analyzed 5 per cent nitrogen, 8 to 8.5 per cent phosphoric acid, 10 to 11 per cent potash. The piece seeded to wheat got 500 pounds of bone and 100 pounds of potash this Fall. The net cost after deducting crops was $134.63. This includes cutting brush, fixing fence, all materials and labor, including my own time.

Connecticut. WILL W. CLARKE.

R. N.-Y.—We do not print this as a model for all farmers to follow. Comparatively few could afford to pay out $25 an acre simply to fit land for a crop of grass. We give all sides of farming, by way of contrast. Before Mr. Clarke is done with this land he will receive good interest on all his investment. At any rate, it pays to fit land as well as we can afford before seeding it down.

CROPS FOR A YOUNG ORCHARD.

On page 1320 C. E. L. asks about planting asparagus between the rows in a young orchard. After working in such an orchard for more than three years, the writer can possibly give some information of interest. The orchard is owned by Minch Bros.' Produce Co. It is in two parts, and contains about 7,000 trees, set 16 by 16 feet. One part contains about 1,500 Yellow Transparent apple trees, seven years old; about 1,100 Williams Red trees, six years old, and about 1,100 Red Astrachan trees, six years old. This part was set with rhubarb about six years ago. The plants were set in hills, making two rows each way in the orchard. This left about six feet between the plants and the trees. The plan was to cultivate north and south one time, and east and west the next. Manure was applied for the first year or two, and annual applications of one-half ton or more of a mixture of bone and muriate of potash was given. The cultivators were kept going until frost, no grass or weeds were permitted to mature seed. The rhubarb grew well and yielded fairly well. At first glance this seemed a desirable crop, as it more than paid for the cultivation and care of the young orchard. The writer has had entire charge of the pruning of this orchard, doing most of the work himself, and so has had a chance to study each tree at least once each year. I have been able to compare this part of the orchard with the other half, which, though younger by two years, has nearly caught up to the older trees in size, and is much easier to train in the proper shape.

The younger orchard has had peppers planted between the rows, allowing room each side of the tree row for the cultivator. The best crop to plant in an orchard is one which will require clean cultivation during the growing period of the trees, and which will allow one to plant a cover crop not later than August 1. Early beets, onions, potatoes and beans are good crops for planting in a young orchard.

A few of the disadvantages of a perennial intercrop are, the long season of cultivation, inducing a late, weak growth of wood, which adds to the work of pruning. The difficulty of cultivating after trees reach their third year, and there is more trouble when one tries to do a good job of spraying. The writer knows of a six-year apple orchard that has had three crops of corn in it, the trees being no larger and much poorer in health than a neighboring three-year-old orchard planted to potatoes and tomatoes. Give the trees first show. R. B. GILMAN.

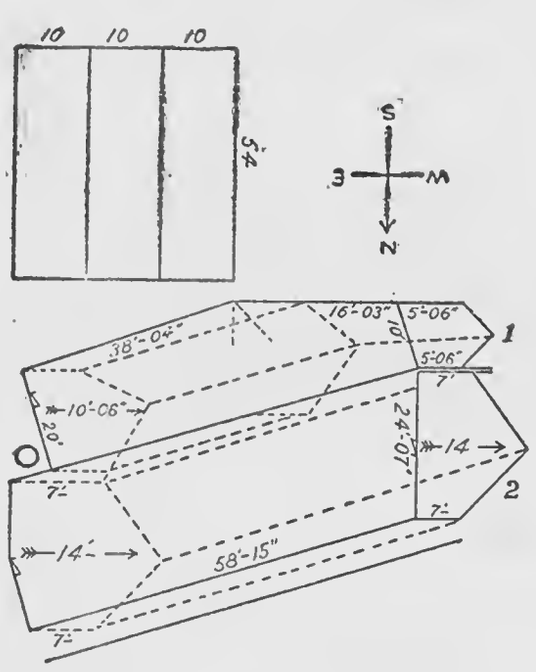
New Jersey.

PIPING A GREENHOUSE.

Diagram gives plan of our greenhouses. We have a hot-water boiler 1,050 feet radiation. House No. 1 is to be used for lettuce, with radishes for a catch crop; house No. 2 to be used for mushrooms. What size pipe, how many feet, and how should the pipe be arranged? We have always used the old system of heating. Our place is near Washington, D. C.

Syracuse, N. Y. O. M.

Greenhouse is 20 feet wide, one end; 10 feet wide at opposite end, 5 feet 6 inches high at eaves, 10 feet 6 inches ridge; temperature to be 50 degrees inside, zero outside. Mushroom house 24 feet 7 inches wide, 7 feet eaves, 14 feet ridge, 58 feet long. Heater apparently located in angle at end of houses. Heater having 1,050 square feet radiation should have 4 feet flow and 4 feet return openings. Assuming mushroom house is constructed as such houses usually are, to give best results, with double sides and roof, packed with about 6 inches to 8 inches sawdust between, about 150 square feet radiation would be required. To obtain this either 252 feet 2-inch pipe, 315 feet 1½-inch, or 345 feet 1¼-inch pipe would be necessary. Either size pipe could be used to good advantage. My preference for so short a house would be 1¼-inch, using six lines, three flows and three returns, placed at bottom of walks, so as not to dry off surface of the beds, as it is desirable to keep heating surfaces as far away from mushroom beds as possible.



PIPING GREENHOUSE. FIG. 6.

The greenhouse should have 14 lines of 1¼-inch pipe at wide end, and 10 should be carried through to narrow end, using half flows and half returns. The flows should be slightly higher than the returns, and run up hill to far end of house, which end should be at least six inches higher than at boiler. Give returns same fall toward boiler, or more if possible. An expansion tank of eight-gallon capacity should be placed 10 feet if possible above boiler, and each flow pipe at far end of house must have an air-cock so the system can be kept clear of air. Connect expansion tank to return pipe at boiler. Be careful to have all flow pipes continually ascending and all returns continually descending. Top of boiler should be several feet lower than flow pipes in mushroom house if possible. ELMER J. WEAVER.

QUESTIONS ABOUT ASPARAGUS.

In Spring, just as soon as the ground is ready for working, I sow broadcast through a fertilizer distributor a ton and a quarter (2,500 pounds) of fertilizer of the following analysis: Nitrogen, equal to ammonia, 4 to 5%; available phosphoric acid, 6 to 8%; total phosphoric acid, 7 to 10%; potash, actual, 10 to 11%. I do not put any other fertilizer or manure on land during year. Do you think I am making a mistake in putting on all the fertilizer at once, or shall I reserve some until I have done cutting for the season? Some around here use kainit after cutting for two or three weeks; do you think it pays? Some time ago you mentioned that lime killed out chickweed and also improved asparagus land. How much lime to the acre should be used, and what kind (crushed stone or air-slaked)? Could fertilizer be diminished or entirely eliminated the Spring that lime is put on?

Concord, Mass. J. B.

I should not put on 2,500 pounds of any ready mixed fertilizer. If this amount was applied to an acre, should apply 1,500 pounds in the Spring and remainder late in June. Kainit has proved of value on sandy lands, but should not apply on heavy soils. Most farmers would be better off if they mixed their own chemicals. Lime helps asparagus very much; use 2,000 pounds to the acre, and harrow in in the Spring. Air-slaked lime is good to use. If marl or limestone is used more will be necessary. Marble dust can be purchased and laid down in Concord for $3 per ton, and if this is ground fine enough should give good results. I should not use quite so much fertilizer when lime is applied. Asparagus needs about 160 pounds of available nitrogen, 230 pounds of potash and 125 pounds of phosphoric acid. Chemicals will be the cheapest form to get the above plant food. If no manure has been used perhaps it would be well to apply five or six tons of manure to get the humus necessary. Muriate of potash is best to use. Bone, acid phosphate or slag may be used for the phosphoric acid, and nitrate of soda for the nitrogen. Cover crops will soon be used in the culture of asparagus, thus increasing with very little cost the vegetable matter and humus in the soil, and giving large quantities of nitrogen, thereby saving the purchase of the costly nitrate of soda. In growing asparagus first get the best rust-resistant stock, mix your own chemicals, grow cover crops before and after the asparagus is set, and one will be surprised at the results. C. J.

MORE ABOUT COVER CROPS.

Under the caption "Cover Crops in Kansas," you refer to me, page 1301, as "opposing the cover-crop plan." You quote from a Kansas paper a story of potato growers in the Kansas River Valley who sow turnips after their early potatoes and plow them under in the Fall for green manure. You continue, "This may mean a combination of cover crop and Fall plowing." That is exactly what it is, and it is a combination that has done much toward putting the Kaw Valley on the map as a potato-growing district. Let us go back to the beginning: "Hope Farm Notes" proposed the Winter cover crop as an all-around good thing. I moved to amend, page 1206, by "excepting the average grain and stock farm," on the ground that a Winter cover crop would prevent such farmers from plowing in the Fall, preparatory to their Spring seeding and planting. The argument in favor of Fall plowing had recently been ably stated in your columns by H. E. Mern. I referred to his articles rather than restate the argument.

My opposition to the cover crop runs to only one variety of it, viz., the *Winter* cover crop; and that for only one class of farmers, viz., the "broadcast farmers," whose Spring work is their heavy work, and who, as a rule, haven't teams enough or help enough to both plow and plant their large acreages in a thorough manner in the short interval that comes "north of the Ohio," between the frost and mud of Spring and the traditional sign for planting to be done—"the hickory leaf as big as a rabbit's ear." For fruit and truck farms, like Hope Farm, the cover crop has a wider use.

Those Kansas potato men you mention—of whom I am one—furnish a case in point. The potato crop in the "bottoms" of the Kansas River is increasing every year. Between Topeka and Kansas City there were probably 15,000 acres of potatoes harvested last year. Preparation has been made for a much larger planting next year—in round numbers, perhaps 20,000 acres. Practically every acre of that prospective potato "patch" is now plowed and waiting for the disk-harrows to start, as soon as the soil is dry enough next Spring. Cow peas, Soy beans, rye, oats and turnips have all been tried to follow potatoes, when dug—ordinarily by August 1. Turnips are the favorite follow crop. But whatever the follow crops may be, all are turned under before it freezes up. The Kansas custom is to double-disk this Fall plowing as soon as the ground is fit in the Spring, which will be ordinarily several days earlier than it would do to plow, and then planting begins. Anything that would postpone the planting until the land could be plowed would be regarded as a calamity.

Kansas. EDWIN TAYLOR.

Up in Alaska there used to be a district attorney who was long on native oratory but short on education. Once, while prosecuting a big case, coming to the finish of his argument, he leaned across the rail and made this plea: "All I asts of you, gentlemen of the jury, is that you now retire and mete out justice as she deserves to be met!"—Toronto Saturday Night.

William P. Stark, America's Foremost Nurseryman

My 1914 Tree-Book FREE To Fruit-Growers

This book contains 120 pages, is beautifully illustrated, describes the cream of the most profitable varieties for home and orchard planting. It tells why William P. Stark trees thrive to such remarkable perfection and produce such profitable crops; why they are preferred by the most successful fruit-growers.

The Great "J. H. Hale" Peach

The marvel of horticulture—⅓ to ½ larger than Elberta, perfect freestone, solid yet tender flesh, smooth skin, a peach practically without fuzz, stands shipment like apples, round and large for preserving, hardiest in the bud, longest fruiting season. Eager buyers more than cleaned out entire stock last spring. Order early for fall planting.

Buy Direct—Save Half

No agents, no middlemen—we share profits with you, and sell you better trees, doubly guaranteed true to name. Sturdy, Ozark Mountain-grown apple, pear, peach, plum, berries and ornamentals. Small orders get special attention. Write today.

Know Before You Plant That Your Trees and Shrubs Will Bloom as You Expect

Shrewd people buy merchandise from established houses—houses that will be in business when they need service. Why should not a planter buy his Trees, Shrubs, Vines, Roses, Bulbs and Seeds with the same precaution? How disappointing it is, when your trees or shrubs have leaved out, to find something you did not order—something you do not want. Have you ever had this experience? Don't take any risk when ordering. Buy direct of the producer and at first cost. We have a reputation at stake. Have been in business 60 years and expect to continue indefinitely. You always know where to find us. 46 greenhouses.

RAILROAD WORM IN APPLES.

What is the best practise to pursue to stamp out, eradicate and destroy the cause of "railroady" apples? A. F. D.
Fall River, Mass.

I would say to anyone who would stamp out, eradicate and destroy the cause of railroady apples that he has a large job on his hands, especially if surrounded by neighbors who raise Fall apples which are allowed to decay under their trees. The trouble with the writer's apples is caused by a small fly which lays the eggs from which the maggots are hatched that cause the railroady appearance in the flesh of his apples. The only practical way known at present to keep them in check is to destroy all such fruit before the maggot leaves the apple. As the fly makes a small puncture in the skin of the apple and there deposits the egg, and the worm as soon as hatched enters the flesh of the apple, spraying as yet, has not proved effective in destroying them. Hard apples with tough skins are rarely attacked, but the earlier soft-skinned and fleshed varieties prove an ideal place for them to breed, and where growers will not unite in destroying such fruit perhaps the most practical way is to raise those varieties less subject to their attack. H. O. MEAD.
Massachusetts.

HANDLING THE SUNFLOWER CROP.

I noted your call last year for information as to care of sunflower seed, also note in a recent issue a writer's views on sunflower seed for fowl; never noted any bad effects from liberal feeding. I have never taken much interest in flower raising of any kind, except sunflowers. Back in the sixties I got the name "sunflower"; rented a piece of land and planted sunflowers around the field and up through bare spots in center. I think they are the most beautiful, easiest raised and all around beneficial flowers on earth. If you do not think so plant a few the coming Spring, and watch them grow. Give them a little care until one foot high; will take care of themselves after that. Notice the strong sturdy plant, with great large green leaves, which cattle and horses relish when green; now note the flower sometimes as large as 14 inches across, with their head turned toward the sun in the morning and nod to it until satisfied, as it were, and then gently bow until following morning, and when matured meekly bow its face toward earth and await man's time to gather. There are several kinds that do well with us, so there is no trouble in having flower seed for fowls from August until snow falls. We had this year; in fact we plant all times from April until July 12, any vacant spots in or around garden, along fences, bare spots in corn, potatoes or beans. They do best where they can grow well above their company; not more than one plant in a place, when hoed first time. No fear of planting too early in Spring, for I have often seen them do well after lying on ground all Winter farther north than New York State.

As to taking care of seed for Winter, have just finished caring for ours, about four bushels. Let them stand until you wish to shell. We have a three-wheel cart, handiest thing on place. The box holds about four bushels, cut off head and thump them against side of box and all good ripe seeds will shell. Throw the remainder with head in hen or pig yard and watch them save the rest; in fact horses will eat the green leaves with eagerness. I considered I could shell one-half bushel per hour alone. I put seed in a coarse bran sack and leave them around in wind and sun a few days, then hang up so rats or mice cannot get on them, as they will try some cute ways to get in bag. If they do you will have naught but shucks in Spring. I have priced them at times in feed stores, and never saw them offered at less than $3 per bushel. In buying prepared fowl feed first thing will show you the few flower seeds, where our fowls have had all they could eat so far this Summer and Fall, and about four bushels for Winter and seed. I just finished yesterday shelling and cutting stalks in stove lengths stored in woodshed. J. H. B.
Collins, N. Y.

PRACTICAL TILE DRAINING METHODS

PART III.

LAYING THE TILE.—After the grading is finished I lay the tile with the hook described. It is easier and quicker for me to lay the tiles with such a hook than by hand, but an expert who worked for me preferred to lay them by hand. He had done most of his ditching in marsh land in Illinois, and usually only dug from two to 2½-foot ditches, which were easier to lay tiles in by hand. I take a tile on the hook, lower it into the ditch, and lay it snugly against the last tile laid in the rounding groove cut to fit it. If it does not make a tight joint I turn it by lifting the hook quickly with a sidewise motion. Here is where the advantage of a straight ditch, well graded, becomes apparent. If straight, the tiles give very little trouble about making tight joints. One must occasionally take out one tile and try another, but not often. After the tiles are laid I throw on some of the fine clay from the bank to hold them, or else shake down some of the subsoil with a spade, walking on it to pack it. I finish filling the ditch with a plow. I cut a pole 12 or 15 feet long and hitch a team to each end and a plow to the middle. Three men and two teams can fill a 40-rod ditch in less than an hour, as two or three bouts are sufficient.

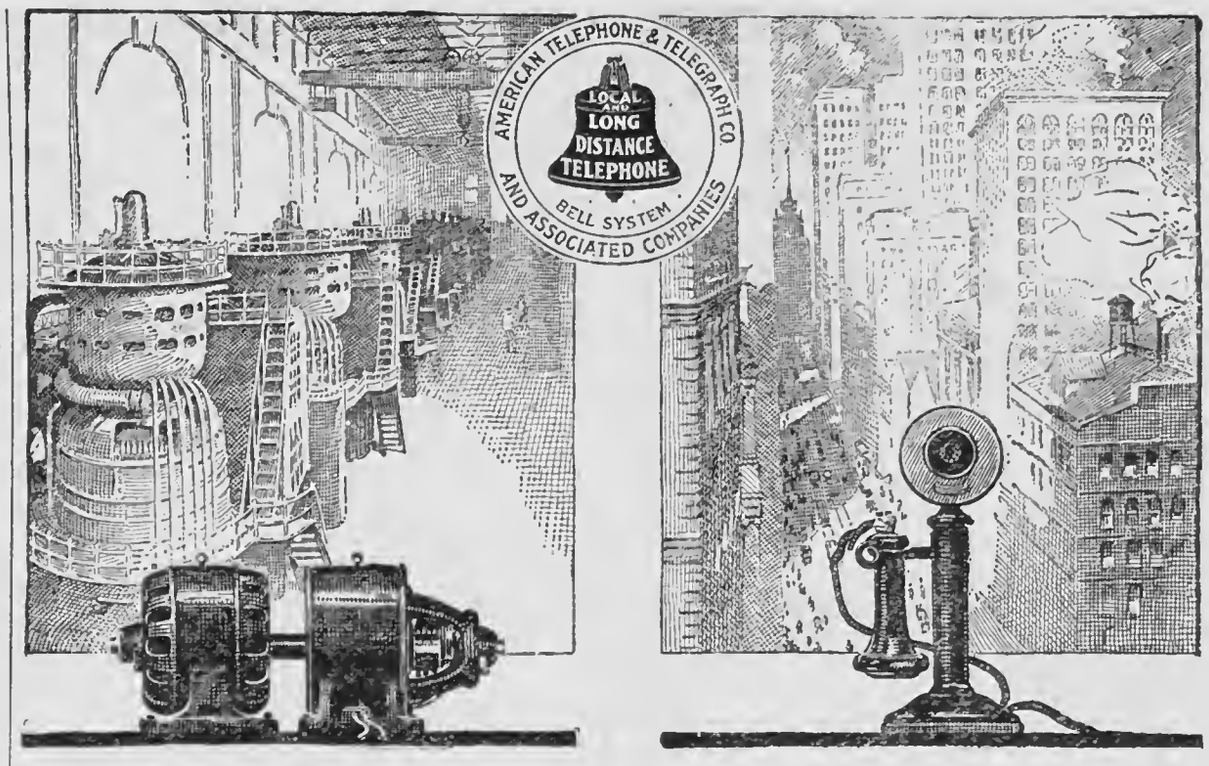
OTHER HINTS.—If I wish to put my tiles down four feet I dig three cuts with the 18-inch spade; two cuts with a 22-inch spade makes three feet four inches. Where possible it is well to plow the piece to be drained in such a manner as to leave a dead furrow where each ditch is to be. Then, by running a plow once more in the dead furrow, one can have his tiles down four feet by digging a ditch three feet or three feet two inches deep. In putting in an eight-inch tile I timed myself for speed. I easily dug one rod and a half of first cut, or one rod of second cut, per hour, in some very stiff clay, digging to grade and cleaning out as I went. This would make a little over six rods in eight hours. One can dig faster where the ditch needs to be only five inches wide instead of a foot. (The above was dug to a depth of three feet four inches.) There seems to be a prejudice against ditching. It is considered dirty, hard work. If performed in the manner which I have described it is not very dirty—certainly not so dirty as handling manure. In deep ditches a pair of slicker pants, cut off below the boot tops, and worn outside the boots, afford a great protection. Much water in the ditch is a disadvantage sometimes encountered in laying large mains. A furrow can frequently be plowed on one side of the ditch and the water diverted. This is a great help.

SIZE OF TILE.—It is hard to give advice as to the size of tile to be used. For laterals with a reasonable fall two-inch is large enough for most places. In quicksand three-inch or larger should be used. For very long laterals some larger tiles on the lower end would be advisable. For mains I should say a three-inch main would drain up to five acres, a four-inch 10 acres, five-inch 15 acres, and a six-inch 25 acres. These sizes are large enough to carry off one-half inch of water in 24 hours on a grade of six inches per hundred feet. In case of indecision between two sizes of tile I should advise that the larger be used, as the larger part of the expense of tiling is in digging and filling the ditch, and it is better to use a little larger tile than to risk having to reopen and relay a drain.
ALBERT DE GRAFF.

THE teacher, who was giving the primary class a nature talk, inquired: "Johnnie, how does a bee sting?" Johnnie, a graduate from the school of experience, replied with emphasis, "Awful!"—Judge.

"JOHNNY," the teacher asked, "can you tell me anything about Christopher Columbus?" "He discovered America." "Yes. What else did he do?" "I s'pose he went home and lectured about it."—Chicago Record-Herald.

A NEW York man in Boston was overtaken by hunger late one night. He entered a quick lunch restaurant, perched himself atop of a stool, and said to the waiter: "Sinkers and coffee." "Sinkers? Sinkers?" said the waiter. "To what do you refer, sir?" "Sinkers are doughnuts in New York," the customer explained. "Oh, I beg your pardon," replied the waiter. "Here we always refer to them as submarines."—New York Tribune.



The Energizer of Business

IN a metropolitan powerhouse there must be generators large enough to furnish millions of lights and provide electrical current for thousands of cars and factories.

Each monster machine with the power of tens of thousands of horses is energized by an unobtrusive little dynamo, which is technically known as an "exciter."

This exciter by its electric impulse through all the coils of the generator brings the whole mechanism into life and activity.

A similar service is performed for the great agencies of business and industry by the telephones of the Bell System. They carry the currents of communication everywhere to energize our intricate social and business mechanism.

United for universal service, Bell Telephones give maximum efficiency to the big generators of production and commerce.

Electric Wheel Co.,
48 Elm Street, Quincy, Ill.

Potato Profits
depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why
IRON AGE *100 Per Cent Planters*
often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "*100 Per Cent Potato Planting*" and copy of Iron Age Farm and Garden News.

EVENTS OF THE WEEK.

DOMESTIC.—Divorcement of the Western Union Telegraph Company from the American Telephone and Telegraph Company, the restoration of competition by the Bell system and the establishment of reciprocal relations between the Bell concern and independent lines are the essential features announced Dec. 19 of an agreement reached by Attorney General McReynolds and N. C. Kingsbury, vice-president of the Bell corporation, as a result of negotiations covering several months. The reorganization plan, which will prevent litigation to dissolve that corporation under the anti-trust act, originated with the company, although it followed many reports that a suit against it might be filed. It was regarded by Department of Justice officials as the most striking indication offered in a decade that "big business" has come to the conclusion that it is better to follow the Sherman law than fight it. The plan meets not only the approval of the Attorney General but also of his chief "trust buster," G. C. Todd, and officials of the subsidiaries of the combine, as well as President Wilson.

The second fire within eight days in the plant of the Rock Plaster Company, at 150th street and the East River, New York, destroyed a two story brick building used as a barrel factory Dec. 21 with a loss of $25,000. The plant suffered a $500,000 fire on the night of December 13.

Bart Dunn, Tammany leader of the Eighteenth Assembly district, Manhattan; Joseph J. Fogarty, an inspector for the State Highways Department, and the Dunbar Construction Company, of which Dunn is president, were found guilty in the Supreme Court at New City, N. Y., Dec. 20, of conspiring to defraud the State in constructing a road in Rockland county. This is the first conviction resulting from one of the indictments obtained by John A. Hennessy while he was special investigator of State graft for Gov. William Sulzer.

According to the report of Fourth Assistant Postmaster-General Blakslee, there were in the United States on March 3 of this year 42,644 rural routes in operation, of which 456 had been established during the current fiscal year. From that date to June 30, 1913, there were established 163 routes and two were discontinued, making a total of 42,805 in operation at the close of the fiscal year. To serve these routes 42,685 carriers were employed, whose annual salaries aggregated $45,377,442. There was a net increase of 606 routes, 14,532 miles and 606 carriers. During the year 114 tri-weekly routes were established, while four were discontinued. At the close of the fiscal year there were 745 tri-weekly routes in operation. On June 30, 1913, the total length of rural routes in operation was 1,038,076 miles; the daily travel 1,028,603 and the annual travel 315,781,121 miles. The average length of routes was 24.25 mills, the average cost per mile $43.71 and the average cost per mile of travel $0.01437.

FARM AND GARDEN.—A regulation issued Dec. 18 by the State Commissioner of Health provides that cold storage goods in New York State in the future must be advertised and sold as such. All persons and firms retailing cold storage products must display prominently a card 8 by 12 inches on which is plainly printed the notice issued by the Health Commissioner. A further regulation makes it unlawful to remove from packages containing cold storage foods the stamps showing when the articles were placed in cold storage and when they were taken out.

The Indianapolis City Health Board recently found bottles of milk in which the cream settled upon the bottom of the bottle, instead of on the top. It was discovered that for a month many persons have been using a manufactured milk, which was sold for the real product. The milk is manufactured by mixing a powder with water and adding enough cream to give the mixture the proper amount of butterfat. This fluid stands all the tests required of real milk. The discovery of the manufactured milk was brought about when one company put too much butterfat in its newly made supply. This caused the cream to settle to the bottom of the bottles. When it was found the manufactured milk fulfilled all requirements as to the various standards the board ordered that hereafter all manufactured milk must be so labelled.

Secretary of Agriculture Houston issued an order Dec. 22 extending the temporary quarantine of the United States against foreign potatoes so as to include importations of potatoes from Newfoundland, the islands of St. Pierre and Miquelon, Great Britain and Ireland, Continental Europe and the Dominion of Canada. This quarantine became effective on December 24, except that shipments covered by consular invoices on or prior to December 24 will be admitted up to January 15, 1914. Secretary Houston makes it plain that there is no potato shortage in the country. It has been contended that if the quaranitne was extended there might be a potato famine here and prices would soar. The embargo practically includes every country from which the United States can receive potatoes, but as soon as any country or district can be shown to be free from potato diseases the quarantine will be lifted. The object of the quarantine is to protect this country from powdery scab and other infections of potato plants.

The highest Christmas tree ever brought to New York was erected by the city authorities in Madison Square Park. It cost $500. This tree, a balsam, is 68 feet in height. It was erected on a 10-foot base, which will make the total a trifle over 75 feet. The tree was cut in Canada, required two flat cars to bring it to New York and the freight was $88. The supply of Christmas trees this year was lighter than last. Ordinarily it takes 150 carloads to supply the city.

THE CURRENCY BILL.—The Administration currency bill was passed Dec. 19. It includes the following features:

A Federal Reserve Board composed of the Secretary of the Treasury and six members, to designate not less than eight nor more than twelve reserve districts, each with a Federal reserve bank.

National banks must and other banks may subscribe to the stock of reserve banks. If the stock subscription is inadequate, stock may be offered to the public.

Of nine Directors of each reserve bank, three are to be designated by the Federal Board.

Stockholders are to receive dividends up to 6 per cent.

Reserve banks are to rediscount paper of other reserve banks.

Employes of the Federal Board are not to be protected by the civil service.

The Government is to make deposits in Federal reserve banks, which are empowered to discount notes, etc., arising from actual transactions.

Notes, etc., based on live stock and agricultural products and maturing in six months may be discounted.

Circulating notes are to be issued by Federal reserve banks and circulated by the member banks.

Every Federal reserve bank must maintain reserves in gold or lawful money of not less than 35 per cent.

The amount of gold in each Federal reserve bank, together with the amount deposited by it with the Treasury, shall equal 40 per cent of the Federal reserve notes in actual circulation.

Federal reserve notes shall be secured by commercial paper of prescribed character and maturity.

Not less than 5 per cent gold for redemption of Federal reserve notes must be maintained on deposit in the Treasury by each Federal reserve bank.

National banks not situated in reserve or Federal cities may make loans on farm lands.

National banks may establish branches in foreign countries.

Members of Congress may not be officers or directors of member banks.

SOUTH PACIFIC VOLCANIC ERUPTION. — Further particulars brought to Sydney, N. S. W., by incoming vessels regarding the volcanic eruption on Ambrim Island, in the New Hebrides, indicate that it was the most violent shock experienced in that part of the world for a century. It is estimated that at least 500 natives have perished. The eruption began on December 5, devastating entire villages and plantations and transforming the whole face of the island. At night the flames were seen shooting a thousand feet in the air, brilliantly illuminating the whole scene of destruction. Huge bowlders were hurled into space and were silhouetted against the brightness of the flames. Dust reaching ten miles from the scene of the volcanic activity caused a great black cloud to spread from the new craters until it blotted out the light of the stars. The ocean itself seemed to boil and effervesce as huge meteors plunged into the sea and lava streams poured down the sides of the mountains and ran into the bay.

Thirty-ninth annual meeting of the American Association of Nurserymen, Cleveland, O., June 24-26, 1914.

CROPS.

Corn 90; hay $8 to $15; potatoes $1; rye 70; oats 52; small fruits 10 to 12 cts. per quart. Cows on sale $60 to $100 per head; butter 32 to 42; eggs 30 to 37. Gardening is not extensively carried on.
Richland, Pa. W. F. S.

Horse sales slow just now. Cows are bringing from $50 up to $80. Beef is selling by the side for 12½ cents; pork, dressed, 11. Milk $1.85 per hundred pounds; butter 22; eggs 34; wheat 88; corn 65; potatoes 70. W. J. Z.
Dalmatia, Pa.

Cows coming fresh in the Spring $40 to $45; dry, on foot for beef, $35; yearlings $30 to $35 for beef; butter 32; eggs 40 to 48; feed about $1.60 per cwt. for meal, $1.35 for bran and middlings; potatoes 80 cents to $1 per bushel, according to quality; apples 75 to 80 cents per bushel. G. B. M.
Cortez, Pa.

Hay $15 to $18; oat straw $8; potatoes $1; turnips 50 to 75; carrots 80; cabbage 2½ cents pound; eggs 40; oats 48 to 50; cows $60 to $80; beef 8 to 10; pork 12 to 14; horses $200 to $300; butter 40 to 42; onions $1 to $1.50; milk $1.90 to $2.10, according to grade; retail, seven cents per quart; buckwheat $1.80 per cwt. T. S. R.
Carthage, N. Y.

We have a Lawrence pear tree in our front yard which looks like one of those Oregon apple trees, from the storm of November 9, when it was in a five-foot drift. Since then we have had fine weather, dandelions in bloom most of the time, and to-day I found a Narcissus, some Crocus and campernelles above ground. Farmers report unimproved roads in very bad condition from the snow and rains.
Elyria, O. W. J. M.

Fat cattle scarce, from $7 to $8 per hundred; stockers $7.25; good grade cows from $60 to $90 per head; hogs $7 to $8 per hundred; stock hogs very scarce; lard 13. Farm horses from $1.25 to $2.25. Old hens 10; springers 11; live turkeys 20; geese 13; ducks 13; country butter 30; creamery 35; fresh country eggs 30. Hay $15 per ton; white corn 62; yellow 60; wheat 93; potatoes, scarce $1 per bushel. Apples about all sold, from $3 to $5 per barrel. The people are taking a great interest in planting new apple orchards in Ross County. F. H. S.
Chillicothe, O.

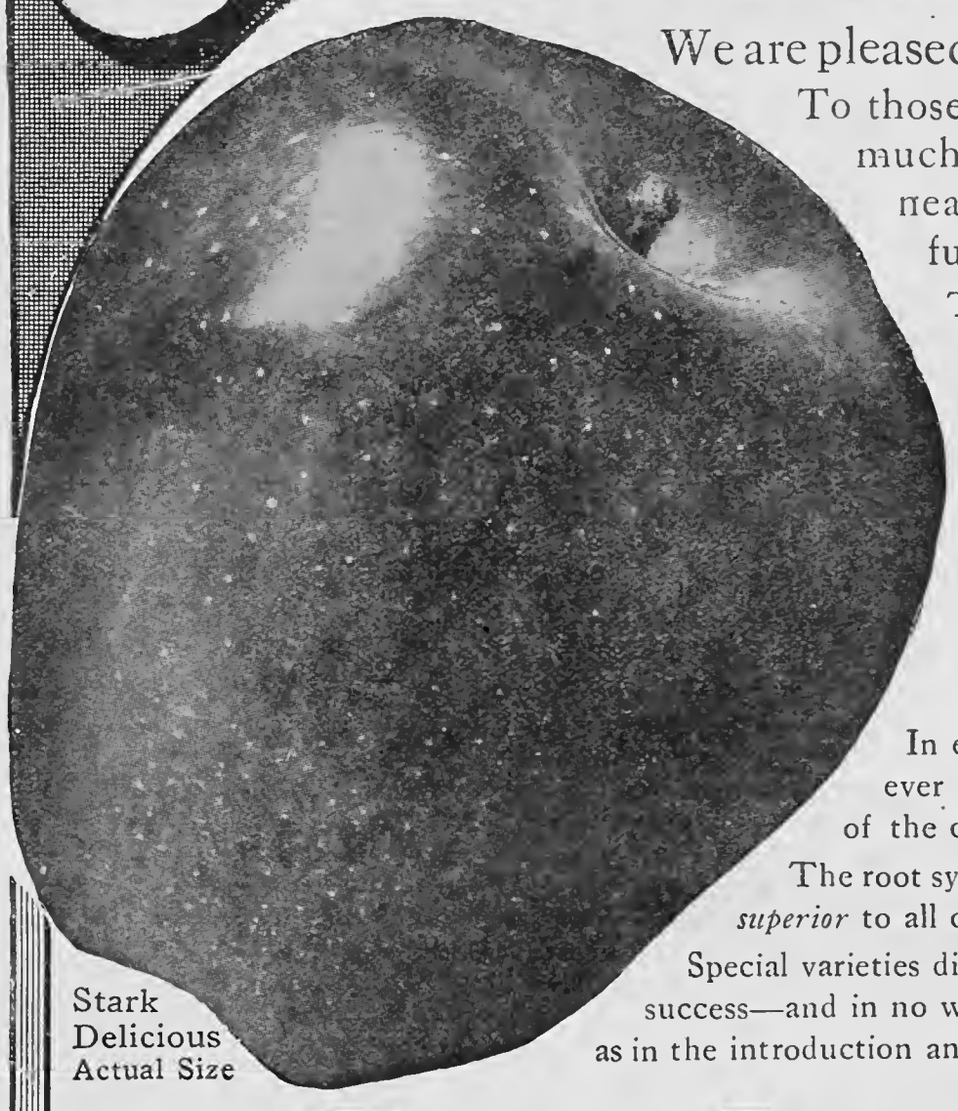
Hay is now selling for $20 per ton in Washington, D. C. Milk 22 cents per gallon; fresh cows $75 to $100, and scarce; fat grass cattle $7.50 to $8 per 100; hogs 9 to 10 cents net. Corn is all needed for home use; little sold out of the county. Robert D. Weaver, of Montgomery County, recently sold his 16 head of steers to A. Loffler, the well-known Washington butcher, at nine cents per pound. When Mr. Weaver bought them their average weight was 990 pounds; when he sold them the average weight was 1,300 pounds. When dressed they averaged 70 pounds per hundred.
Ashton, Md. T. J. L.

Cows selling from $40 to $75, with registered Holstein stock $200. Good young horses, weighing about 1,200 pounds, $200 each, with higher prices for extra points. I have heard of no hog sales for a long time. The Fillmore Belfast Dairy Product Co pays $1.85 for 100 pounds December milk, for shipment to New York, Philadelphia and Buffalo. Eggs, fresh, bring in trade or cash sometimes 40 to 45 cents; creamery butter 30¼ to patrons of creamery. The dealers paid for apples $1.50 to $2 per barrel, the dealer furnishing barrel and assisting in packing. Apples by retail 60 to 75 cents per bushel. Garden crops are not dealt in very extensively here. Potatoes about half a crop, and practically none shipped frfom this vicinity. A boarding-house nearby has been trying to stock up all the Fall, and has just succeeded in getting 100 bushels for 70 cents per bushel. Dealers buying hay for shipping pay $10 to $12.50 per ton, seller to board men while baling and deliver hay to car. W. V. R.
Canadea, N. Y.

STARK TREES AT LOUISIANA, MO. SINCE 1816

Stark Bros.

1914 Year Book Is Ready for You—FREE



Stark Delicious Actual Size

We are pleased to announce the finest Year Book we have ever published. To those who have received Stark Year Books in other seasons this means much—for just as Stark trees have stood supreme in their class for nearly a hundred years, so the Stark Year Book has become the faithful guide of thousands in all their purchases of things that grow.

The new Year Book contains a lot of valuable hints and helps, besides correctly describing and showing in most attractive form the many proved varieties that have insured *Stark leadership* since 1816.

In addition to our own descriptions, we give the opinions of scores of famous authorities, making the work invaluable as a text and reference book on fruit growing for tree planters of all sections.

Write today for your copy of the new great Year Book.

Stark Service

In every department of this great business—from the growing of the trees or whatever you buy to the delivery of the goods—*Stark Service* works to the best interest of the customer.

The root system of the apple trees grown by us in our Ozark Mountain nurseries makes them *superior* to all others in vigor, thrift and producing power.

Special varieties discovered and introduced by us have been responsible for a great measure of our success—and in no way have we served the fruit growers of this country to such profitable advantage as in the introduction and distribution of

Stark Delicious

"Easily the Best Apple of Any Time"

Here is a tree that is indeed *orchard perfection.* It is hardy, a thrifty grower, bears young—and every year; blooms late and resists ordinary orchard diseases to a remarkable degree.

This year we hope to be able to meet the wonderfully increased demand for Stark Delicious, but our advice is to get your orders in early. The marvelous successes of Stark Delicious have proved to be the sensation of the fruit world, and if you are not getting the *apple profits* you should have, lose no time in placing Stark Delicious in your orchard.

Will Help You Make Selections

If you are planting a home orchard, our Special Service Department will select varieties for you, so there will be no mistake. We will choose the kinds best adapted to your climatic and soil conditions, the ones that will give you the most pleasure at fruiting time and bring good prices on the markets—should you have an oversupply. Even if you plant but one tree you owe it to yourself to plant nothing but the best you can buy.

We guarantee safe arrival on all orders. All boxing and packing is done free. The Stark method of packing is famous the world over. Stark trees are propagated from selected and proven strains of bearing trees and are grown in the locality best adapted to their growth and development. To do this we maintain branch nurseries in several States. Healthy, thrifty, strong-rooted, vigorous trees are the result.

Stark Bros. Great Selective List

The Stark Year Book describes such *standard* varieties as Stark Delicious, Stark King David, Stayman Winesap, Black Ben, Jonathan, Grimes Golden, Liveland Raspberry, Wilson Red June, Rome Beauty, Wealthy, York Imperial, Winesap, Baldwin, Northern Spy, Duchess, McIntosh, Winter Banana, Paragon Winesap, Albemarle Pippin, Newtown Pippin, Champion, Senator, Spitzenberg and Yellow Transparent.

Also all good varieties of peach, pear, plum, cherry, apricot, quince, nectarine, grape vines, blackberry, raspberry, gooseberry, dewberry, currant—everything the fruit grower wants. Shade and ornamental trees, ornamental shrubs, climbers, hedges, roses—everything to beautify your grounds.

PROPAGATING SHADE TREES.

Tell us about the propagation of some of our common shade trees, particularly the maple and elm. C. J. O.
Columbus, O.

Practically all forest tree seeds require some sort of treatment, preparatory to being sown in the seed bed, the most common and successful of which is known as that of stratification. The seeds should be gathered as soon as ripe and should not be exposed to the air longer than is necessary for the outside of the shell or shuck to become dry, when they should be immediately mixed with damp sand to prevent the meaty part containing the germ from becoming hard and dry, as many of the seeds will fail to germinate if allowed to become thoroughly dried. Maples, elms, ash and other tree seeds of like nature are usually mixed with sand in flat boxes four or five inches deep, or placed in thin layers in the boxes with an inch or so of sand between the layers of seed, each box holding three to four layers of seed, according to its size. The after care of the boxes of seeds, that is, how they shall be cared for, depends much on the soil conditions and facilities at hand. Where the soil conditions are suitable, burying the boxes is preferable to some operators while others prefer placing the boxes on the surface and covering them with earth or clean litter of some kind, or a combination of both. If an elevated well-drained situation is available, burying the boxes will probably prove the most successful to the inexperienced. For the purpose, open a trench the width of the boxes and 15 to 20 inches deep in which place the boxes in a single row and cover them with a single thickness of one-inch boards, being careful to see that the tops of the boxes are entirely covered with the boards. Then fill the trench with earth, slightly rounding the top. The object of burying them so deeply is to prevent premature germination of any precocious individuals that may be among them. The board covering will eliminate the possible danger of destruction of the seeds by vermin, and their disturbance with the shovel when the boxes are taken out. If it is desirable or necessary to store the boxes on the surface, select some protected place, under a tree or in an open shed, place the boxes in a row and cover tightly with boards, drive strong stakes in the ground one foot away from the boxes all around, to which nail boards to a height of 18 inches. Cover the boxes up to the top of the boards with earth, or six inches of earth finishing with leaves or other clean litter, or litter alone may be used. In the storing of the seeds on the surface every precaution must be taken against the depredations from mice, squirrels, etc., and, when leaves or other litter is used alone for covering, the boxes should be examined occasionally to see if vermin has found its way into the seeds, and to water them if too much dried out. This method of storing the boxes will be found very satisfactory when the seeds are to be sown the following Spring.

The seeds of the oaks and chestnuts do not require stratifying, and may be sown as soon as ripe, but they must have protection from vermin, or all may be carried away. The ash very seldom germinates until the second year. Therefore this must be borne in mind, and the seeds be allowed to remain in the stratifying condition until the second Spring when they are to be sown in the seed bed. Mostly all forest tree seeds may be sown soon as ripe, but for the following reasons it is not advisable to do so. There is always danger of their being washed out by the Fall and Winter rains, heaved out by frost and carried away and eaten by mice and squirrels, resulting in more or less loss.

The hickory and all other hard-shelled nuts should be exposed to the sun for three or four days after gathering, when they may be buried in the ground and covered six to 12 inches deep, or, may be planted in rows 18 inches apart and four inches apart in the row. If buried in bulk soil should be mixed through them and when so handled they are taken up in early Spring and planted in rows, same as described for Fall planting. Cover about two inches deep. All Fall-sown seed should have a mulching of leaves, straw or other litter as soon as ground freezes. The mulching should be removed early in the following Spring, before the seedlings appear.

The depth the seeds of the various trees are to be covered with soil depends much on the size of the seed. The maples, ashes, etc., should be covered about one inch; oaks and chestnuts about two inches. The rule usually followed is to cover the seeds of whatever kind to a depth equal to three or four times the diameter or thickness of the seed. Seeds of maples, ash, elms, etc., may be sown in rows 16 to 18 inches apart and one inch apart in the row. The seedlings of most forest trees are as a rule transplanted to nursery rows at the age of one to two years. The rows should be four feet apart and the seedlings six to eight inches apart in the row. K.

Spring-sown Vetch and Oats.

Could Hairy vetch be sown in Spring with oats, and both cut for hay? I think it would make a possible crop, as oats here are not a sure crop. R. G. H.
Missouri.

No. The Hairy vetch would not be satisfactory. Spring vetch would be better, but we should use Canada field peas with the oats. They will give a better combination feed.

"CAN you build a stack?" said the farmer to a laborer who wanted a job. "Sure I can. I can build a stack the shape of an egg." When the stack was nearly completed, the bottom shot out and the stack came to the ground as flat as a pancake. "I thought you said you could build a stack the shape of an egg," said the farmer. "So I did. But I didn't say whether it was a boiled egg or a fried one."—Winnipeg Telegram.

THE
PROVIDENCE TRACTOR
SEE IT AT THE NEW YORK
FRUIT GROWERS' ASSOCIATION MEETING
ROCHESTER, JANUARY 7 to 10
This is the ideal tractor for Orchard and Farm Work—only two wheels, turns shorter than a team of horses; no vibration; 3-cylinder, 20 horse-power engine.
If you do not attend the Rochester Meeting, write us for full particulars

AMERICAN POMOLOGICAL SOCIETY.

PART III.

Prof. W. R. Lazenby, of Ohio, having been in France, read a short paper on "Some Phases of French Horticulture." He told of the wonderful changes that had come about since the overthrow of the selfish domination of the kings and their courtiers, who made great palaces in the midst of vast estates for their own pleasure, to the use of these places as experiment grounds for horticulture and kindred industries, thus turning them to the good of the public. Their growing of fruits is exceedingly formal in style, and on a small scale compared with ours, but their work is well done and good returns are obtained. The vineyards have been crowded, and this has induced feeble growth and disease, but some are giving the vines more room. A few have planted grapes on both sides of rows of shade trees and trained them to spread over the tree tops and run on strands of wire stretched from tree to tree, thus giving them room to grow after a natural fashion. Many of the fine gardens are intersected by walls to which fruit trees are trained. Much of the fruit is sacked while very young and allowed to grow and ripen in the paper or muslin bags. Some use different colored bags to produce desired effects by the control of the light.

"Tropical Fruits in the Philippines" was treated by P. J. Wester, official horticulturist of those islands. He said that the cocoanut yielded the greatest value for export of anything grown there, even surpassing either the hemp or sugar industries. The form in which the product is marketed, chiefly, is copra, which is the dried meat of the nuts and is used in Europe for making oil, mainly. The banana is the principal fruit used as food, every little place having it growing for bome use. There are five edible species and about one hundred varieties found in the entire group of islands. Many of them are of small size but very soft and delicious, and others are very large and hard and are used for cooking. The papaya is next in importance for food, but is rarely grown by anyone for sale in commercial quantities. The mandarin, one of the smaller of the Citrus fruits, is very popular. The mango grows luxuriantly although little attention has been given so far to cultivating the choice varieties, only three of this class being at all common. Recently the experiment station has imported many choice varieties from India and elsewhere for trial. The pineapple is grown more for the fibre in the leaves than for its fruit, but attempts are now being made to grow the Smooth Cayenne and a few other varieties for canning for export trade. The sapodilla of the West Indies, called chico in the Philippines, does remarkably well, and is used freely, as is the case with the guava and many other fruits mentioned. The possibilities of the culture of cocoa (chocolate bean) are great but almost unknown. Fruit culture there is scarcely in its infancy as yet.

"Alaska's Pomological Resources" was ably set forth by Prof. C. C. Georgeson, Director of Experiment Stations for that territory. There is a native crabapple growing abundantly along the southern coast that yields a small fruit used extensively for making jelly, even by the natives, and it serves well as a stock upon which to grow the cultivated crabapple and a very few varieties of the hardier apples, such as the Yellow Transparent, that may be grown there in a few favored localities. A few cherries have been grown in some places along the coast, especially the Early Richmond, but with no marked success. Plums have failed and the same is true of pears and grapes. Red raspberries have succeeded, especially the Cuthbert, but the blackcaps and blackberries have failed. Alaska abounds with bush fruits of several kinds, those of the Vaccinium or huckleberry and blueberry genus being the most abundant. There are native cranberries of good quality. Some species of Rubus are found wild that are of a creeping nature, and bear rather small berries, but of good quality. Gooseberries, currants and strawberries grow wild all along the coast and in the interior to some extent. When I was in Alaska a few years ago I saw at Sitka a great many most interesting crosses that Prof. Georgeson had made between some of our cultivated bush fruits and strawberries and the native species, and they gave great hopes of securing valuable varieties. Alaska has very little in the way of cultivated fruits as yet, but there are good possibilities.

The matter of grading, packing and marketing fruits came up repeatedly, and was ably treated by good papers and also by discussions on the floor. Mr. R. G. Phillips, secretary of the International Apple Shipper's Association, strongly presented the subject, laying especial stress on the point that the western growers and packers only send their best fruit to market, whereas in the East everything was sold. This could only make a marked impression on the markets, for the buyers did not expect to find poor stuff in the western packages, but they did in those put up in the East, and were rarely mistaken in either case. If the eastern people would use the same judgment and care that the western people do there would be better profits for all. There are no regulations in the East preventing the packing and sending to market of the worst fruit that is grown, while in the West there are certain reasonable restrictions, and the growers as well as all the rest are benefited by them. The only regulations in the East are about marketing the grades, and these are often violated. The most essential point of all is that there be "a square deal." This is far too rarely given by the graders and packers and always with disastrous results in the end.

Mr. E. H. Shepard of Hood River, Oregon, was not present, but he sent a valuable paper. He stated that organization was the most important point in the whole matter of getting the most out of what the growers produce. They now only get a little over 26 per cent of what the consumers pay. By organization they may get far more, and also save in cost of production, buying things they need and in other ways. Economical and satisfactory distribution will follow proper organization. The whole Northwest has united in an organization for the purpose of establishing proper regulations as to grading, packing and sending their fruit to the markets of the world and others should do the same.

The nut growers had a convention aside from their participation in the meeting of the Pomological Society, and there were some interesting points brought out. Prof. W. W. Hutt of North Carolina gave a very full account of the growing of pecans in the South, where there are many thousands of trees of the best varieties known already in bearing, and many more not old enough, besides extensive planting still going on. There is a bright future as well as a profitable present for pecan growing. The hardiest varieties that are native to Southern Indiana and similar regions are being brought to light propagated and planted over the more Northern States, where there is every reason to expect success, except where the growing seasons are too short for the nuts to mature.

The chestnut came in for much attention and the terrible disease that is ravaging the trees in the Northeastern States. There is not yet found a ready means of stopping its spread, and no cure whatever for affected trees. Complete destruction of every tree that shows the signs of blight is the only means of fighting it, except that there is hope of growing some kinds that are immune to it. The Asiatic species are somewhat of this character. The State of Pennsylvania, where there are large and valuable chestnut orchards and groves of grafted stump sprouts, is striving to eradicate the disease with some hope of success.

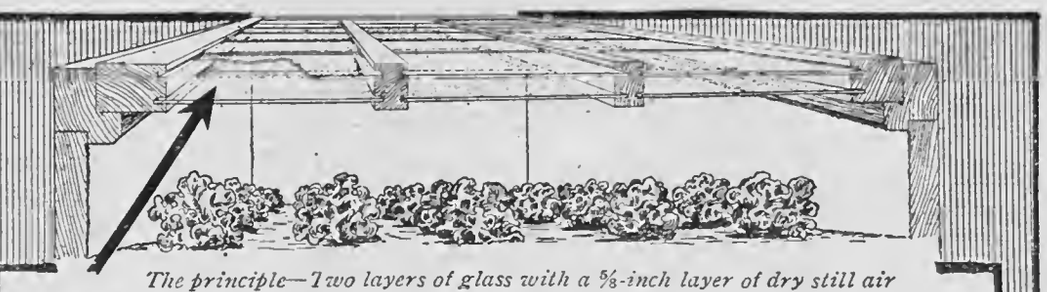
Prof. J. Russell Smith of the Pennsylvania State University gave very interesting and instructive talks about the wonderful extent to which the chestnut and acorn crops of Southern Europe are utilized. In some places they are the main crops and not only the people but the animals subsist on them. He thinks we ought to follow out and practice this idea much more than we do. Our hickories, aside from the pecan, may be a great source of profit for their nuts and their wood is always very valuable.

There was a splendid show of fruit and nuts in connection with the meetings. The best apples were from Virginia, North Carolina, New England, Canada and Washington, those of Virginia being the best of all in grade and pack. There were several extensive exhibits of seedlings, some of them being the results of careful cross-breeding. They showed some progress towards more desirable Winter varieties than many of those now grown and marketed. Notable among these new seedlings were those from the New York Experiment Station, from the Missouri Fruit Experiment Station and a lot from the Canadian Station. There were a number shown by Mr. C. G. Patten of Iowa that he has been many years in developing for the colder northern sections. A very fine new seedling Winter apple from northeast Georgia is called Rabun.

Of cross-bred Citrus fruits there was a large display from Florida that had been grown for the purpose of extending their culture farther north than is at present possible because of the tenderness of ordinary oranges. The hardy Citrus trifoliata was used extensively and some of its crosses with the sweet oranges give some hopes of partial success. The Glen St. Mary Nurseries showed a very fine lot of Asiatic persimmons and also a set of samples of trees and stocks showing that they had succeeded well in their propagation.

There was a large collection of grapes by the government expert, Mr. G. C. Husmann. The nut display was very complete, from the hickorynuts of New England to the cocoanuts of South Florida and the tropics beyond. But the most interesting and attractive exhibit was that by the Board of Trade of Miami, Florida, in which were immense clusters of Citrus fruits and many strange valuble tropical fruits as well.

H. E. VAN DEMAN.



The principle—Two layers of glass with a 5/8-inch layer of dry still air

Make the Sun earn you profits in winter

The Sunlight Double Glass Sash captures the sun's rays and warms up the hot-bed and cold-frame during the day and then holds the heat throughout the long winter night. A 5/8-inch of space of dead air shuts out the cold and shuts in the warmth, letting in the light, and protecting better than mats or boards. If you grow plants of any kind that must be started early to get early crops and big prices, you owe it to your pocketbook to equip your garden with Sunlight Double Glass Sash.

Ten years' use has proved their success. Made of best cypress glazed or repaired in half the usual time; eliminating all need of mats or shutters; making plants early without undue forcing—they are simply indispensable to obtain the best results.

A new sun-heated greenhouse

The Sunlight idea has been carried into an inexpensive greenhouse, 11"x12", or 11"x24", or 11"x36", or 11"x48" in size. It is made of Sunlight Double Glass Sash, which are instantly adjustable for top ventilation and instantly removable for use on hotbeds or cold-frames. Thus they serve a double purpose. For this reason, and also because no expensive system of artificial heating is required, this greenhouse is the cheapest you can buy.

Our catalog gives full particulars regarding both sash and greenhouse.

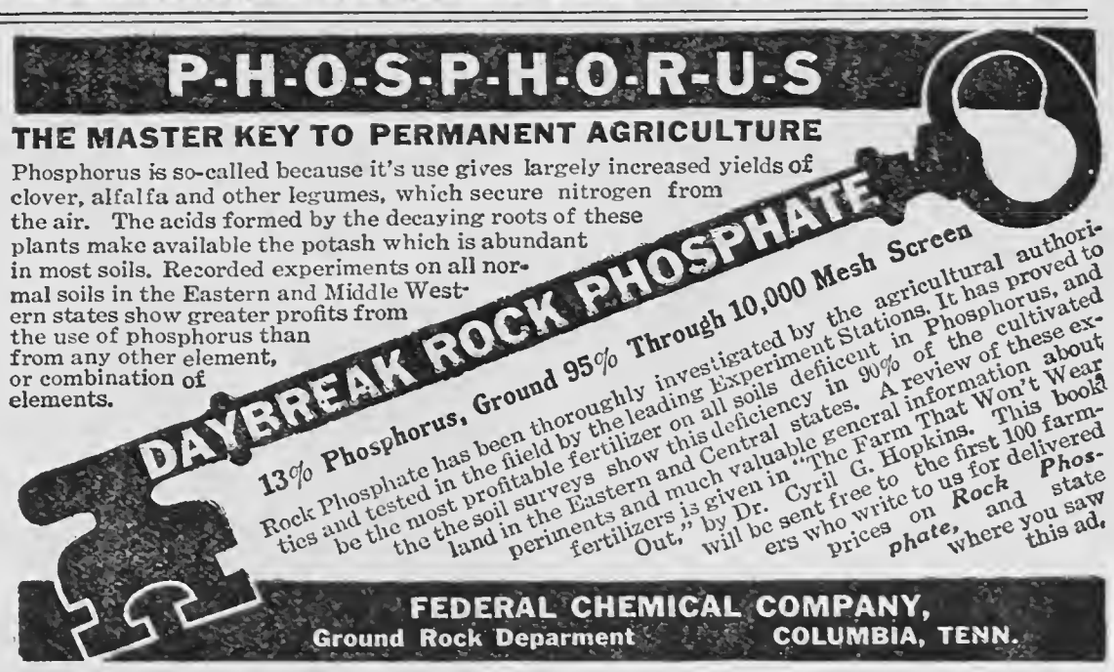
THE MASTER KEY TO PERMANENT AGRICULTURE

Phosphorus is so-called because it's use gives largely increased yields of clover, alfalfa and other legumes, which secure nitrogen from the air. The acids formed by the decaying roots of these plants make available the potash which is abundant in most soils. Recorded experiments on all normal soils in the Eastern and Middle Western states show greater profits from the use of phosphorus than from any other element, or combination of elements.



Rock Phosphate has been thoroughly investigated by the agricultural authorities and tested in the field by the leading Experiment Stations. It has proved to be the most profitable fertilizer on all soils deficent in Phosphorus, and the the soil surveys show this deficiency in 90% of the cultivated land in the Eastern and Central states. A review of these experiments and much valuable general information about fertilizers is given in "The Farm That Won't Wear Out," by Dr. Cyril G. Hopkins. This book will be sent free to us for delivered prices on *Rock Phosphate*, and state where you saw this ad.

FILBERTS IN MONTANA.

I have been a reader of THE R. N.-Y. for many years, and always found it interesting and instructive. I just read H. A. F.'s article on page 1272 in regard to growing filberts, and as I have been interested in that question for some time, I would like to ask for some information. Last Spring I wrote the Agricultural Department at Washington for information on growing filberts, but they said they had not studied the question of growing them in this section. So far as I know there is no kind of nuts growing either wild or cultivated here. I am located in what is called the Swan Valley, between the Mission and Kootenai ranges of the Rocky Mountains, near the Swan River, between the lake of that name and Flathead Lake, altitude about 3,000 feet, country pretty much covered with forest of pine, fir and tamarack. Apples, plums and cherries grow finely here, and I never saw better strawberries than can be raised here, although I have lived near the berry section of Norfolk, Va. But our market facilities are poor, as we are 23 miles from railroad, so it is necessary for us to grow something that can be marketed at leisure. I have always thought some variety of nuts on the farm would be a sound investment. Could you tell me whether nuts would grow in this locality? I would like to try filberts, as I think they would more nearly suit this locality than any other kind; but would like to hear from some one who has experience with them. Would it be best to get the nuts and plant them, or would you advise getting the seedlings? Where can I get them and when is the best time to plant? Our climate is very good, no bad storms, and the thermometer seldom goes below 10 deg. in the Winter, although down in the open country it gets considerably colder, snow gets deep back in the mountains, while here it will average about two feet on the level.

Big Fork, Mont. M. O. E.

It is almost a certainty that the filbert will flourish in the region where M. O. E. lives in Montana. I know that it is not very far west of there that the wild hazel of the Pacific Coast is abundant, and in the same region I have seen the European hazel or filbert growing and bearing without any signs of the blight that affects it in the Eastern States. It would be well to plant some of the named varieties of the filberts offered for sale by the western nurserymen. It is also quite certain that the chestnut and Persian walnut will succeed in that part of Montana described, for the Winters are comparatively mild and all seasons of the year free from violent changes. These nut trees should be given a good trial there. H. E. VAN DEMAN.

AN EXPERIENCE WITH SULPHUR.

[Last Spring we invited our readers to try experiments with sulphur used on potatoes and other crops. Some of them did so, and we print herewith the first report.]

About a year ago there were articles in THE R. N.-Y. about experiments with sulphur on different crops at the experiment stations, so I thought I would like to try sulphur in a small way. I got two barrels (520 pounds). First I scattered one barrel on the mangel patch (three-eighths of an acre; from this I saw no results whatever, perhaps due to the long dry weather. Next, when we cut the potatoes we sifted the sulphur on the cut pieces, after first soaking the whole potatoes in formalin. When nearly through cutting we decided to leave a few separate from those we put sulphur on to see if there was any noticeable difference. We planted Irish Cobbler, Miller's Favorite and Carman, all being sulphured except the last half of the Carman. I used with the drill 800 pounds kainit on 1½ acre, then about 1,600 pounds of potato fertilizer, about 2-5-10. We cultivated and hoed, and had a very nice clean piece; did not spray but used sulphur and air-slaked lime with Paris green for bugs, going over the piece with a sifter once. The blight began its work in the Cobbler and the first half of the Carman early, but worked on only occasionally a hill to start on, so that about half of these two were yet green at the time of the early frost, September 9. The Miller's Favorite had sulphur on, but were green at the time of the frost. The last half of the Carmans that had no sulphur were also green at the time of the frost. Last year our potatoes were quite scabby, hence the using of the formalin. When we came to dig we had very nice smooth tubers but not large on account of blight and frost, but nice market size, the Cobbler and Miller's Favorite being nicest. There was not a single scab where the sulphur was used, but when we dug the Carman, that had not been sulphured there were a few scabby ones, but the yield was much larger. I think if I had not used sulphur the yield would have been much larger, but the tubers would not have been so nice. Also, if I had planted all Miller's Favorite we would have harvested 100 bushels more potatoes, as they yielded better and were larger. Conclusion, no sulphur for me next year, except with lime and Paris green on tops for bugs. E. P. F.

West Kortright, N. Y.

COST OF HEATING FIXTURES.

How much more will it cost me to put heating fixtures in my house of six rooms that I am building than if I put none in? I cannot understand why one contractor can put up a house of the same size, and just as good, for three or four hundred dollars less than another.

Suffern, N. Y. G. C.

Assuming that two houses are built equally well so far as workmanship is concerned, the additional cost of one over the other is apt to be due to one of two things, the type of heating system installed or the way in which the house is finished inside. The different woods used for finishing vary greatly in their cost from the cheapest, knotty fir to the richest grained oak and mahogany. Some woods which look equally well vary greatly in first cost, and only experts can tell the difference between them when varnished while, obviously, if they are painted no person can tell which is which by mere observation. It makes a difference, too, whether or not a carpenter is allowed to use short pieces or pieces with knots in them. Particularly with hardwood floors some owners insist that only straight grained pieces must be used, and that there must be no piecing of the strips in the floor, but every strip must go the whole width. This, of course, is expensive. Some builders use 2x3-inch joists for the walls, thus making thinner walls than when the regulation 3x4-inch joists are used. This is a cheaper construction and, while it may be all right, it should not be done without the consent of the owner. Some contractors will not stoop to slighting a job, and insist on putting in the sized joists and beams which experience has shown them are proper. Such contractors have to charge more for the job.

As for the heating of a house, there are three common systems, and many are the advocates of each. There is no doubt that hot air is the cheapest form of heat. A six-room house can have a hot air system properly installed for between $200 and $250. A system can be installed for less than this, but if properly designed for more economical consumption of coal, provision being made to prevent any waste of heat, ventilation being provided for, and care being taken that the fumes from the fire cannot enter the air pipes, $250 will be about the cost, and in some sections of the country even more than this. For an equally well installed steam system the cost will be in the neighborhood of $450. A hot water system will cost slightly more than this, if properly designed. On the other hand, some contractors will put a hot-air system in a six-room house for as low as $80 and a hot water plant for less than $300. As you say, it would be interesting to have the experiences of some readers on this proposition, including the amount of coal burned last year and the number of rooms which were kept heated, and what provision is made in their system for a regular supply of fresh air. R. P. C.

WAYNE COUNTY, N.Y., FRUIT MATTERS

With a general advance of from two to three cents a pound since the season opened, evaporated apples now promise to redeem some of the prestige lost last season, when the cold storages rather than the marts of trade received so much of the finished product. Ruling warehouse quotations now are as follows: Prime, 7½ to 8 cents per pound; choice, 8½ to 9 cents; fancy 9 to 10 cents; waste, 2¼ cents; chops, 2¼ cents. The market is firm at every point. Many claim that the upward movement has just started, and that further heavy advances are in store. It is estimated that there are not to exceed 500 or 600 cars of the evaporated fruit, both old and new left in the hands of the dealers. The estimate on waste is based at 150 cars. The evaporators have had a short run, though the year has been profitable to all except those who sold short early in the season. The high prices at which fresh apples have been sold have given much stimulation to the movement of the dried product.

Considerable interest is manifest in fruit circles in the experimental work being conducted by the Government in converting cider into syrup that will in itself be a profitable product on the market as well as a product that can later be converted into its former stage of sweet cider by the addition of water. The process requires the extraction of water from the cider by centrifugal action, leaving only one-third water mixed wtih the solids. It requires about three days to freeze the cider properly before it goes into the machine for the first time after being ground fine, and this course is repeated twice in order to extract the great bulk of water. The syrup is delicious. A number of two quart jars, sealed by the vacuum process, will be placed in storage by the Government for further experimental purposes. The syrup is slow to ferment and when placed in storage will keep for a long time. H. C. Gore, expert chemist of the Department of Agriculture, has had marked success this Fall with condensed cider experiments in the Hood River district.

Cows $50 to $85; hogs $12 per hundred, dressed; calves $12 to $14, dressed; hay $15 per ton; straw $10 to $12; milk 20 cents per gallon, 2 cents off for freight to Pittsburgh; potatoes $1 to $1.10; corn 60 to 70; oats 50 to 60; wheat $1.00 to $1.10; butter 35 to 38; eggs 45 to 48; chickens 12 to 14, and very slow sale in this market. O. L. C.

Celia, Pa.

Fresh cows from $75 to $90; cows coming fresh in the Spring from $40 to $55; fed calves, about six months old, from $15 to $20. No movement in potatoes at present; in fact, there has not been any to speak of this Fall, buyers offering about 69. Fresh eggs 40. Our butter is sold through a co-operative creamery, which is bringing us about 35 cents per pound. Apples about $1 per bushel, but no crop; onions $1.25; No. 1 Timothy hay $8 to $10 per ton in the barn.

Corry, Pa. J. B. C.

Corn is being bought at the elevators at from 65 to 68 cents per bushel of 68 pounds, or about 93 cents per hundred pounds. Wheat to-day (Dec. 18) is being bought at 93 cents per bushel. Oats very scarce, as we raise but very few. Extra good fat cattle will bring $7.75, but they must be good. Inferior would not rate so high as that. Stock cattle are being bought for $5 to $5.50 and $6 per hundred pounds. Hogs are quoted at $7; good ones $7.25. Butter 26; eggs 30; chickens 10½ per pound. Turkeys almost eliminated. The growing crop of wheat is certainly looking fine. Apples $1 per bushel, and some are higher than that, but $1 is an average price. N. P.

Circleville, O.

Following are the prices at New Haven, seven miles east of Fort Wayne, the county seat. Some are a little better than Fort Wayne pays. Corn, new, 80 cents per cwt. at elevators; wheat 92 a bushel; oats 37; rye 57; barley 50; Timothy hay No. 1 $12; mixed hay $10 to $11; clover $8 to $9; straw $5, baled; baling costs $1.50 a ton; clover seed $8.25; Timothy seed $2.50 eggs 28; butter 30; chickens 10 to 11; steers $7 per cwt.; veal $10; hogs $7.25; sheep $2 to $5; lamb $6.50 to 7; potatoes 70. Last car of Michigan potatoes that I know of sold about a month ago for 70 cents, f.o.b Fort Wayne. Potato conditions are poor stock, does not keep well nor sell well; few people bought Winter supplies, expecting price to go lower. Good apples are as scarce as fresh eggs were in November, poor in color and quality; best stock brings $5 per barrel and not what I would call fancy. Commission men get $1.25 and $1.50 per bushel basket for a No. 1 apple. Fancy or best stock that cost dealer $5 per barrel retails at 60 cents a peck, or five and six cents per pound, and not all the apples are sound at that, so that a dealer makes very little on that stock. H. H.

New Model 27 Marlin REPEATING RIFLE

.25 Rim Fire—for all game smaller than deer. Uses cartridges of surprising accuracy up to 200 yards, powerful and reliable but *cheap* because *rim-fire.*

Rifle with round barrel **$13.15**

Made in .25-20 and .32-20 calibres also; octagon barrel only; $15. Use both regular and high velocity cartridges. Powerful enough for deer, safe to use in settled districts, excellent for target work, foxes, geese, woodchucks, etc.

Its exclusive features: the quick, smooth working *"pump" action*; the wear-resisting *Special Smokeless Steel* barrel; the modern *solid-top* and *side ejector* for rapid, accurate firing, increased safety and convenience. It has take-down construction and *Ivory Bead* front sight; these cost extra on other rifles of these calibres.

Our 128 page catalog describes the full *Marlin* line. Sent for three stamps postage. Write for it.

The Home Acre.

Water Sprouts; Cherry Fruit Buds.

1. What is the right name for young shoots on pear, apple trees, etc.? Is the name water sprouts or suckers? 2. Do cherry buds grow close to the bud of the last year? In other words, can you injure the next year's buds by pulling the stems off instead of twisting them off? Some authorities say you injure some buds. N. R.

New Cumberland, Pa.

1. The approved name for the shoots that come out on the larger branches of apple, pear and other trees is "water sprouts" rather than suckers. They are of a succulent nature, while in the growing state, and that is why this name is given them. Sprouts that come up from the roots of trees and bushes are usually called "suckers" and they sometimes detract from the growth of the parents and that is why the name sucker is applied.

2. The fruit buds of the cherry are always formed on short spurs and while new spurs are formed each year some of the old ones that have had fruit buds and fruit on them will set more buds of the same kind. It is possible to injure the prospects of the future crop to a very small degree by careless gathering of the fruit. To pull off the wood and buds with the cherries is all wrong.

H. E. VAN DEMAN.

Globe Artichoke.

I sowed seeds of crown artichoke December 15; last year I sowed them in January, had them established in eight-inch pots by May, then I planted them out in good rich heavy soil. They grew along slowly, are now strong crowns, but bore no fruit. I have been told that this is the only way to grow them in Northern Massachusetts, from seed every year. Is this so, and what kind of soil do they like best? J. M.

Stockbridge, Mass.

A plantation of this vegetable, whether started from seed or suckers, will make but few if any flower heads the first year, as it requires one year's growth in the open ground to form good crowns, after which, with proper care, the plantation will remain in bearing for a number of years. This plant is generally considered hardy, but north of Washington the plants will need more or less protection in Winter, varying according to the severity of the cold. In the latitude of Massachusetts, a mulching of eight to 12 inches of leaves or coarse manure should be put around the plants and between the rows to protect them from freezing. A sandy and somewhat moist loam is best suited to this vegetable, and during dry weather in Summer it should be freely watered. K.

Use of Tobacco Stems.

I send you a sample of tobacco stems which I can buy at $6 per ton of about 100 bushels, delivered on my young apple orchard, two years planted. Do you consider them worth the money or what would you suppose them worth? Would you advise them hauled on the orchard now, or not until Spring and turned down right away? Barnyard manure cannot be had here. I think two tons of the stems per acre would do some good if they are worth the price. R. A. K.

Yoe, Pa.

These stems are apparently of very good quality. As plant food they are worth about five times as much as manure. We should be glad to get any quantity at this price. You can haul them now and then scatter around the trees. Do not throw them up close to the trunk, but leave six inches or so of bare ground —then scatter the stems evenly over the ground. They are also very good for the garden or for hen's nests.

Top-Dressing With Limestone.

Would it pay to haul ground limestone four miles if you could get it for 60 cents per ton? If so, and it was applied to wheat sown last Fall, would it be any benefit to the wheat? Would it be any benefit to the clover seed to be sown in the Spring, if applied this Winter? E. G. M.

It will pay to haul this ground limestone, but we have never received benefit from lime put on top of the crops and left there. The effective way to use lime is to work it down into the soil. This is best done by spreading after plowing or digging and harrowing in.

Fruit Trees in Garden.

I have part of my garden in which I have planted some young fruit trees; I am also using it as a garden, manuring it heavily every year. Would it be possible to continue using this as a garden after the trees are bearing, by fertilizing heavily? I might add that most of these trees are dwarfs, and are planted about 20 feet each way. M. M. W.

Yes, you can continue to grow some of your vegetables among these trees. Some vegetables, like sweet corn, will not do so well in the shade, while others will make a fair growth under these conditions. They will not make full crops when grown among the trees, but can be made to pay.

Dormant Spraying.

What is meant by treating or spraying trees in the dormant season? Does this mean in the Winter? C. F. B.

Gibsonia, Pa.

A "dormant tree" refers to the Winter season, when there is no growth. The tree is practically asleep at this time. With Spring the tree wakes up, its sap begins to circulate and its buds swell. We can spray the dormant tree with a stronger solution than would be safe when the buds are tender or broken out.

Remedy for Apple Canker.

Will you give formula for making paint or wash for canker on fruit trees, and how and when to apply? J. S. M.

Springfield, Mo.

Formerly this Station recommended a mixture of whitewash, blue vitriol and wood ashes as a dressing for wounds made by apple canker; but it is now held that the best method of treating such wounds is first carefully to remove the dead bark and decayed wood, thoroughly disinfect the wound with a 1-1000 solution of corrosive sublimate, and cover with coal tar. If the canker is not too large this treatment will prolong the life of the limb sufficiently to make its use profitable. F. C. STEWART.

Geneva (N. Y.) Exp. Station.

Making a New Soil.

I have a small place here of three acres which I am putting into vegetables and fruits as fast as I can. A part of my land has been robbed of its surface soil, exposing the mixture of yellow and red clay which underlies the surface soil in this section. I wish to get this under soil in condition so that it can be used for fruit or nut trees as soon as possible. What would you recommend me to sow which would grow on such soil and bring up its fertility? I have used quite a little manure on this land, but all I have succeeded in raising so far is a crop of weeds. M. M. W.

Nyack, N. Y.

This soil needs lime and organic matter. The top soil having been taken off, the bottom or subsoil must now be thoroughly shaken up, sweetened and filled with humus. If the ground is now bare, have it plowed deeply in the Spring, and after plowing use at least one ton of slaked lime per acre. Harrow this thoroughly into the ground, and seed a combination of turnip seed and oats. This will make a fair growth, and in June plow this all under, and broadcast about 400 pounds per acre of a good fertilizer suitable for corn. Then sow two bushels of buckwheat per acre. Add to the buckwheat one bushel of rye, and 12 pounds of Crimson clover seed. This should make a fair growth. Let the buckwheat die down upon the ground after frost, and leave the rye and Crimson clover alone. They will grow on through the Fall and start up in the Spring. Plow them under when the rye is about three feet high. Work up the ground thoroughly, and you may then begin to plant corn, potatoes, or similar crops, using a fair quantity of fertilizer when you plant. The lime and these green crops will greatly help the soil.

"THEY are always talkin' about the wonders of electricity," said Farmer Corntossel, "but there's one of its greatest achievements they don't mention." "To what do you refer?" "The way it has killed off the fellers who made jokes about people who went to town an' blew out the gas."—Washington Star.

"HERE'S something queer," said the dentist. "You say this tooth has never been worked on before, but I find small flakes of gold on my instrument." "I think you have struck my back collar button," replied the victim.—Buffalo Commercial.

FATHER: "Upon my word, you children are getting too dainty for anything. Jam and butter on the same piece of bread, indeed! Why, when I was your age I was glad to get enough dry bread to eat." Robert: "You have a much better time living with us, don't you, father?"—National Monthly.

E. Frank Coe Fertilizers

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS 1913

Do You Raise 300 Bushels of Potatoes per Acre?

THREE hundred bushels per acre is not an unusual yield by any means, but did you get it this year?

¶If you were planning to raise 300 bushels of potatoes to the acre how far apart would you space your rows? How far apart would you drop the seed pieces in the row?

¶How much fertilizer would you use to grow 300 bushels of potatoes per acre? How would you apply it?

¶Are you sure that your seed potatoes are true to name and true to type?

¶What are you doing to prevent "scab," and early and late blight?

¶Did you have a short crop of potatoes because of dry weather? Have you decided how you will overcome this trouble in the future?

¶All these practical points, and many more, are fully covered in our new book

"Potatoes: A Money Crop"

which will be sent free to every potato grower who requests a copy, and mentions this paper.

¶This book is written by a man who himself has had years of experience as a potato grower, and who has made a careful study of the best methods of other growers.

¶If you read this book you will keep it for future reference. It is a "worth while" publication.

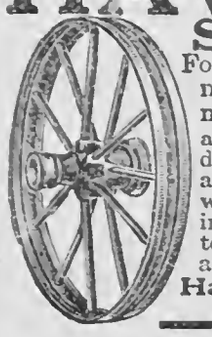
Buy A Cahoon Seed Sower By Parcel Post

The Cahoon has the only discharger scientifically constructed to scatter seed evenly in front of the operator and not against his person. Years of world-wide use prove it to be simplest, most accurate and durable Broadcast Sower made. Sows all grain or grass seed. Made entirely of steel, iron, brass and heavy canvas. Wide breast plate makes it easiest to carry. Needed on every farm. Some alfalfa ranches have a dozen. If dealer will not supply you, Parcel Post permits us to send it for $3.50 prepaid in U. S. A. Order today. Warranted to give satisfaction. *Even Seeding brings Good Reaping.*

GOODELL COMPANY, 47 Main St., Antrim, N. H.

HAVANA Steel Wheels



For any wagon or cart you may have on your farm. We make the wheels to fit your axle. You give us the exact dimensions of your axle, as asked for on our order sheet, and we guarantee a fit. If you are interested, we shall be pleased to forward you our catalogue and order sheet. *Write us.*

Havana Metal Wheel Co.
Box 17, Havana, Illinois

Hope Farm Notes

People tell of the great value and virtue of a constant supply of running water in the house. They cannot say too much about it, for of all the things which make a farm home worth while a sure water supply, just where it is needed, ranks near the top of the list. You never know how useful and worthy it is until it is shut off by accident. When we bought this farm there was no convenient water supply. An old well some 80 feet deep, near the house, had failed, and former owners filled it in with stones. It had become a nuisance, as in wet times water rose in it and kept the house damp. There was a big cistern for rain water under the house, but all drinking water was carried from a distant spring. We got the farm at a low figure because of this lack of water. Customers looked the place over and liked it, but when the women folks found there was no water except far down under the rock, there was nothing more to it.

There were two ways for us to obtain a water supply. One was to clean out a spring on the hillside and pipe the water down—the other to drill a well near the buildings. After some figuring I decided upon the wells—though I now think the other plan would have been better. We had a six-inch hole drilled down into the ground—142 feet deep. At 16 feet they struck the solid rock and an iron casing was driven into this. The water rises to within about 35 feet of the surface of the ground. It is remarkably pure—better I think than much of the bottled water which is sold. We put a windmill over this well. After 13 years of constant service it is still working whenever the wind blows. There have been no repairs in all that time except a few broken chains. This past season we have helped this old veteran by taking the gasoline engine off the sprayer and mounting it near the pump, to be used when the wind is still. The water is pumped into a tank at the top of the house, which supplies a full outfit of water devices.

I think this outfit added 25 per cent to the value of the farm at once. This might not be true of some country localities but here close to the large cities, a good water supply is necessary if you would sell your property. Aside from any increase of value the comfort and character which such a water supply will give is beyond calculation. I say "character," well knowing what the word means. If a fair water supply with the fixtures and necessities which go with it could be put into every farmhouse, many of the troubles of farmers would be on the road to settlement. It would help to create the confidence and satisfaction with home which, after all, are the things which are the foundation of improvement. Whenever water runs freely through a farm home it does far more than carry dirt away, or leave warmth behind. It also takes away a lot of prejudice and the mean part of human life, which stand in the way of improvement and a broad view of life. Take it from me that if during this New Year, there is any possible way for you to bring running water to your house, and heat it after it gets there, such work will prove a big investment.

We found it so and got to the point where 500 gallons of water per day would hardly take care of us. Then our old friend, the pump, went on a strike. I admit that we have worked him hard, and perhaps we did not keep his joints tightened up or give him the finest footing to stand on. He probably tried to tell us something like this:

"You don't give me a chance to rest. These house folks come calling more water! When they are satisfied these great horses and cows come with bottomless stomachs, also calling more water. That whirling thing above me pulls my backbone up and down with jumps and starts. When his arms are tired this coughing and spitting engine takes me by the collar harder than ever. They take their days off, but there is no rest for Mr. Pump. I'm going to quit."

Nobody seemed to understand him, and so he struck. Philip and Merrill pulled him up to see what ailed him but the pump had decided that he preferred the scrap heap to being man-handled by the windmill and engine. So he just let go his grip and 40 feet or more of pipe and pump went rattling and banging down into that 142-foot hole in the ground—and the Hope Farm water works stopped working. The man who drilled the well and knew how to get that pipe out was doing jury duty. Our folks never did think so much of water as during the days needed to put another pump at work. The old pipe was to come out. To the average man the idea of fishing for a pipe in a small dark hole over 100 feet below ground would look like an impossible thing. To the man who knows how to do it it's easy. A pump pipe is not like a fish—to bite at a hook. In order to get this one they took an iron pipe just large enough to go into the well casing. It was open at both ends. At the top was a strong iron bale or handle and at the bottom two strong steel rods crossing at right angles, so as to leave four spaces for the pipe to pass up through. Held in by these small rods was a steel disk or plate just large enough to play up and down inside the large pipe, and with little notches at its rim. They fastened this tool to a rope and lowered it gently down into the well-hole, working it up and down and around. The plan was to strike the pipe and then by lunging and pushing to get the rim of this tool between the end of the pipe and casing. Then the end of the pipe would run up through this tool, lifting one side of the steel disk as it went. When it got far enough up through the rope could be pulled tight. As the pipe was lifted its weight would pull down the disk and the harder it pulled down the tighter that lip of steel held it in place. That is just what happened. After a few trials they gripped the pipe and pulled it slowly up. The first time it caught on the casing and held back. With a small mirror they could throw a light down into the hole and see where it was caught. The next time they got it and slowly pulled it out. Then we put in a new pump and the engine and windmill will soon show it that life is one steady round of labor. I now think we would have done better if in the first place we had piped the water from our spring. At any rate this has really shown us the true value of a water supply. I think we must come to irrigation before long, and in that event we shall want the well, the spring and also the brook at the lower end of the farm.

I wish to say a word on the shooting in the dark at chicken thieves. Your advice "to load with salt and aim high" will suit two classes of persons. Every chicken thief in the United States will approve that advice. Then, that pretty large class of goody-good people will fully approve your plan. This latter class includes the people who sign petitions to have criminals pardoned and who are strongly opposed to soldiers. One of these goody-good fellows is opposed to the construction of battleships—wants to rely entirely on the Bible in cases of international disputes. Say, instead of loading with salt and aiming high, would it not be better to take the Bible out and, in a loud voice read, "Thou shalt not steal." R. M. R.

Another good thing to read might be: *Thou shalt not kill!"*

It looks as if I am in the minority on this shooting business. There are some fierce fighters abroad and many of them have suffered so severely from chicken thieves that they bitterly resent any thought of mercy. I have no desire to shoot anyone. I think a good active dog will take care of most thieves. I do not know that anyone ever called me "goody-goody," though a goodly number of names have been thrown this way. Count me, however, as one opposed to war and battle. Personally I rejoice that this nation has avoided war with Mexico. I hear fire-eaters now and then telling what great things they would do on the battlefield, but it is doubtful if they would ever get within gunshot of danger. I know all about war that I care to. In the Civil War my father and two of his brothers were killed, and another was wounded. That made a large hole in a family which lived on the earnings of the men folks from day to day. You cannot tell me a thing about what war means to the widows and children who are left to fight the world when husband and father are killed. No war for your humble servant. I think my father's generation did all the fighting which may reasonably be expected of our family! As for chicken thieves I will bet on a good Airedale to tear their clothes off. H. W. C.

LITTLE GIANT SPRAYERS

LIGHT RIGS WITH LOTS OF POWER

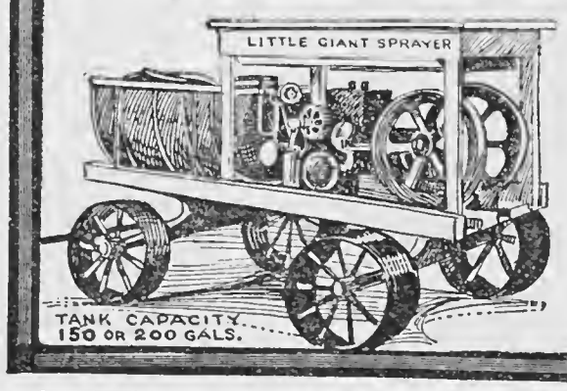
We make a complete line of Sprayers for Orchard, Field and Vineyard, both Hand and Power Types. Built to stand up under hard work, and so constructed that they put the spray where you want it, and combine maximum power and strength with minimum draft weight, so that they won't kill horses on rough, heavy ground.

Little Giant Orchard Power Sprayers

are built in two sizes with tanks of 200 gallons and 100 gallons capacity. Both are equipped with a special pump of our own make, especially powerful, easy working, and so simply constructed that every part is accessible.

THE PUMP WITH THE CLUTCH

is a Little Giant feature. By throwing out the clutch the pump may be stopped without stopping engine or interfering with agitator. It's a great advantage to be able to crank the engine without having the pump attached. You can also mix your solution thoroughly before starting spraying.



LITTLE GIANTS

are giving extra satisfactory service to many growers. It will be worth your while to write for our catalog and prices

POTATOES RUNNING OUT.

I am advised by neighbors not to use my own potatoes for seed next year. They say potatoes "run out" if grown on the same type of soil for more than two years. What is your opinion about this?

No. Stoughton, Mass. A. N. S.

The weight of experience is greatly in favor of frequently procuring seed potatoes from localities where they are especially well grown rather than to rely on home saving from year to year. Unless your variety of potatoes is particularly suited to your soil and climate there will likely be deterioration as the seasons go on. Potatoes "run out" locally not so much because they are grown for successive years in the same type of soil as from the cumulative effect of adverse climatic conditions, which may not favor such thorough development of the tubers as fits them for seed purposes, though they may be entirely suitable for the food market. The northern tier of States—Maine, Vermont, New York, Wisconsin and the Dakotas—appear to have a monopoly in the production of seed potatoes, as the excess of sunlight and general climatic range during the growing season in these latitudes admirably suit the potato plant, enabling it to store the tubers with the energy needed to make vigorous growth when planted in less favorable localities. There is apparently just as good potato soil south of the forty-third parallel of latitude as north of it, but potatoes do not mature as well for seed purposes as in the North, except possibly in Colorado and other elevated regions of the central plateaus where conditions of sunlight and temperature range in Summer that obtain in the North are practically duplicated. Small potato plantings for home use may be kept for a considerable time to a satisfactory standard of production by careful selection of seed tubers from the best hills or plant, but in a larger way it is generally profitable to procure seed stocks from reliable northern sources.

V.

THE GIANT AMARYLLIS.

A catalogue for 1913 lists "Burbank's Amaryllis." It asks a good price, says they are an extra good thing and that the blooms are one foot across. Do you believe this statement? Do you know anything about them? I grow these bulbs for my own use, have a lot of my own seedlings. I have bulbs from California and I have bloomed my own seedlings, have had bloom seven inches across but never saw nor heard of one before one foot across. N. J. P.

The show Amaryllis or Hippeastrum, as the botanists term it, is one of the most highly developed of flowering plants, having been under practically continuous hybridization and critical selection for more than 100 years. Seeds are rarely produced under cultivation without careful hand pollination, as the flowers have become so large and open that the natural agencies of wind and insect life no longer appear to effect the transfer of pollen from the anthers to the stigmatic surfaces. It being necessary to fertilize the blooms artificially growers naturally make the most desirable combinations in the flower, and the result is that nearly all commercial strains are good, and the inheritance tendencies of the better forms so marked that anyone can grow fine seedlings if he uses high-class seed and pollen parents. The modern pot Amaryllis is indeed a magnificent cultural triumph. Every strain worthy of the name should include plants producing blooms quite 12 inches across when grown under congenial conditions, but the largest flowers are not always the handsomest, as they are occasionally lacking in substance and harmonious coloring. An exhibit of 2,000 of these gorgeous monsters, the result of crossing a few particularly fine imported varieties, in one of the greenhouses of the Department of Agriculture at Washington last Winter, created quite a sensation, many judges thinking the blooms surpassed anything hitherto shown. There were scores of plants with blooms a foot across, but these sometimes failed to elicit as great admiration as smaller ones of better form and brighter colors.

Those who have visited Luther Burbank's California garden will credit him with being an excellent cultivator of his specialties. It is entirely probable that he has grown seedling Amaryllis with blooms as large as advertised, but the best kinds in the experience of all growers are often slow to propagate, and do not quickly find their way into commerce. The writer has grown the Burbank strain of Amaryllis procured from dealers, and found it of only ordinary merit. Others who have tried these varieties from different sources report that it is "good stock, but nothing to brag of."

V.

POLLENIZATION OF CORN.

Has there ever been a theory advanced, regarding the sex of the rows of grain on an ear of corn? To my mind it has struck me for some time that there is the closest affinity as male and female, each male row pollenizing the next row exclusively and none other. For instance, I have never, in counting the rows on corn, found any but even rows, eight, 10, 12 and so on, as high as 24 rows. Why not nine, 11, etc, if every other row was not male and female? Again, it is always strongely marked, where an ear is defective it is never one row missing, but two rows will be equally short, stopping exactly together. H. B. G.

James Island, S. C.

The fecundation of maize or corn is effected by the pollen cells produced by the tassels or male inflorescence falling on the exposed stigmatic surfaces of the silks or styles, which represent the female flowers, as in corn the two sets of organs are developed far apart. A pollen tube grows down inside the silk and fertilizes the ovule or embryonic cell at the base, which later grows into a seed or kernel of corn. The seeds or grains of corn have nothing to do with each other in the way of pollination. Each in effect contains a miniature sexless plant, wrapped in protective coatings and attached to the standing endosperm or reserve food supply needed to maintain its early growth, and can in no way affect its neighbors in the adjoining rows. Corn is a monocotyledonous plant with one seed leaf and solitary leaves, alternately arranged on the stem, but the seed rows on the cob or spadix are binary in arrangement, occurring always in pairs. Thus we have four pairs of kernel rows in eight-rowed corn up to 11 pairs on 22 rows in some extreme varieties, but no instances are know of ears having odd numbers of rows. The even numbering of the rows is a characteristic inherent in corn and has nothing to do with pollination.

V.

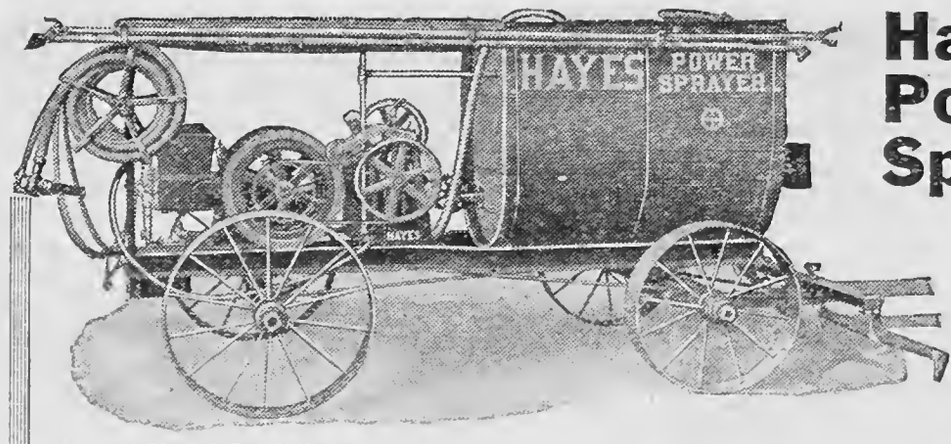
AGRICULTURAL EXPEDITION TO BRAZIL

The Bureau of Plant Industry is sending an expedition to Brazil, which will include P. H. Dorsett, Plant Introducer of the Office of Plant Introduction, Wilson Popenoe, agricultural explorer, and A. D. Shamel, physiologist of the Office of Pomological and Horticultural Investigations.

Mr. Shamel's remarkable discovery that there are at least nine distinct strains or types of the Bahia navel orange represented in the California orchards has raised the question as to whether or not Mr. William Saunders' importation in 1870 brought in the best navel in existence at Bahia and whether this remarkable variety has varied in Bahia as it has in California.

It is hoped that Mr. Shamel, with the assistance of the other members of the expedition will be able to make a thorough investigation of the matter. So little is known of the plant resources of this great unexplored area of Southern Brazil, that the expedition may be expected to discover new forms of valuable plants which are not in the literature. The high plateaus visited by occasional frosts, and the borders of the large arid regions surrounded by sub-tropical forests are habitats where forms are likely to be found which will be subject to acclimatization in our Southern States.

The Department states that the rapidly growing Mate industry, the wild fibre plant Caroa, the myrtaceous fruits such as the Jaboticaba, the Passifloras, the bamboos, and the rubber plant, are a few of the many things which have provisionally been put on the program for investigation. The expedition goes out fully equipped to get natural size photographs of fruits, and herbarium material, as well as living seeds and plants of everything worthy of introduction and it will confine its attention to the Provinces of Bahia, Rio, Minas, and Sao Paulo. This must be considered a preliminary study of the gigantic problem of utilizing for American farmers and fruit growers of the Southern States the valuable plants of Southern Brazil.



Hayes Power Sprayer

300 Pounds Pressure Guaranteed

HIGH PRESSURE spraying produces a better quality and larger quantity of salable fruit. The HAYES is *guaranteed* to maintain 300 lbs. pressure. It thoroughly covers every particle of foliage with a penetrating fog-like mist, insures results and saves solution.

HAYES large capacity, high pressure triplex pump, special design engine and improved agitator are built for high pressure work. Strong, steel frame, cross braced and hot riveted. All steel, non-tip-over, *cross reach* orchard truck that turns in 14 ft. *Cannot strike trees in turning.* Large capacity, light weight, light draft. The HAYES is sure, reliable and easy in operation and *guaranteed* in efficiency.

25 Styles For Small or Large Orchards

SPRAY Rigs of All Sizes For All Uses

Junior Leader Orchard Sprayer with 2 H. P. engine, 3-plunger pump.

Junior Leader Sprayer

Keeps 6 nozzles going at high pressure. Automatic agitation of liquid, suction strainer is brush cleaned. We also make Bucket, Barrel, Mounted 4-Row Potato Sprayers, etc. Free catalog describes entire line. Write for it. Also spraying formula, calendar and complete spraying directions. Address

FIELD FORCE PUMP CO., 2 11th St., Elmira, N.Y.

The Bastian "Oregon" Pruning Hook

Operates with a simple pump-gun action upon a powerful compound lever which forces the sharp Sheffield Steel cutting blade through a limb an inch thick with but little effort. Makes a smooth, clean cut. No side-strain on the pole-handle. The natural position of hands gives the operator ease, speed and accuracy.

The Bastian "Oregon" Pruning Shears

Have the same easy-working but powerful compound action as the pruning hook. They are especially handy for cutting out water sprouts, heading back young trees, trimming hedges, berry bushes, etc.

The Bastian "Oregon" Fruit Picker

picks the choice fruit that's "out of reach" without bruising it in the least. It soon saves enough fruit to pay for itself.

Try These Orchard Tools

BASTIAN "OREGON" ORCHARD TOOLS are made of the very best materials—they are powerful, durble and handy to use. Reasonable in price and guaranteed. Made in all lengths. If your dealer has no Bastian "Oregon" Tools in stock, do not accept substitutes, but write to us and we'll send prices and name of nearest dealer who can supply you—or we'll ship direct. Write now for descriptive circular.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

WE regret to learn of the death of an old friend, John M. Jamison, of Ohio, who died at his home on December 12. Mr. Jamison was one of the most intelligent and thorough farmers in Ohio. A man of the highest character, whatever he said or wrote was accepted as sound personal experience or conviction. Mr. Jamison was one of the famons "old guard"—men who 25 years ago kept alive the spirit of agricultural education when it required hard work and strong faith to do so. In these easier and richer days our young men do not fully realize what these old veterans did in laying the foundations.

*

"That editorial is —— narrow."
"The editorial is God's truth."

What are we to say when these forcible, opposite opinions are honestly expressed by educated men? Can you easily think of a statement of which both of these remarks may be true? The editorial referred to is found on page 1205. We stated that the endowed colleges do not seem to offer great hope for the peculiar educational needs of the common people. As these colleges grow more and more independent of direct support from the public they grow more and more away from the actual needs of the working classes. Some of them do this openly and rather defiantly, while others follow the sources of their endowments unconsciously. All, however, are, we think, journeying on toward what we may call class education. This being so the great hope for the popular education of the future lies in our State universities and agricultural colleges. These are State or National institutions, supported not by private endowments but by general taxation. They are therefore for the people, which comes more and more to mean that portion of our people who need popular and truly practical education. It follows naturally if these propositions are accepted that these public universities and colleges should be administered in the direct interests of the people who need their help. This means that our agricultural colleges should be organized and dominated by the true spirit of farming or agriculture, and right here is where the two men quoted above separate. One seems to think that these colleges are best served by business or professional men who either own a farm as a plaything or as a side issue in their business, or who deal with farmers in some trade capacity. Our friend thinks that such men are by training and experience better qualified to run an institution. By having one toe or part of one foot on the soil he thinks they acquire enough of this spirit of agriculture to enable them to know what a farmer needs. The other man thinks that since these colleges are for *farmers* they should be such both by name and nature. Thus they should be dominated and controlled by men, the majority of whom make all or most of their living out of the land in practical farming. Granting that such men have the needed business capacity, they will be more likely to possess that true "spirit of agriculture" than the other class. We believe that this last proposition is correct. It is a great question, and we should welcome an argument from those who think the agricultural college should not be controlled by real farmers.

WE are now to have a new department, "The Home Acre." Under this heading will be discussed the peculiar problems of the man with a garden or comparatively small piece of land which he must work to its full capacity. These men must have their soil in the best condition, make the best selection of seeds and plants and give them the finest care. This is "intensive culture." It is absolutely necessary on a small piece of land, and becoming more and more necessary on all our Eastern farms. Our new department will give the best possible methods of making the soil productive, and take up in ample season the questions of selecting varieties, planting and care. An expert gardener of long experience will tell how to plant and beautify the grounds around a house. He can sketch plans, make lists of desirable trees and shrubs, and tell how to care for them. The best experts in garden and fruit culture will be on call to answer questions and suggestions. This work will prove invaluable to "The Home Acre" man, and the farmer with broad acres can also learn how to make the garden the most valuable spot on the farm.

*

"HAPPY DAYS."

AT this season of the year we get the real thing in heart-to-heart talks with our readers. It is the season for renewing subscriptions, and thousands of people take advantage of the opportunity to wrap some good wish or good-natured criticism or bit of experience around their dollar. They all want to help in some way—all want to prove our statement that THE R. N.-Y. is closer to its readers than any other paper in the country. What texts these good friends give us in their letters!

"My neighbors used to take THE R. N.-Y. *to please me. Now they take it to please themselves."*

New Jersey. I. S. B.

Sooner or later a paper must stand or fall by about that test. In these days few businesslike people will pay for a paper simply to please their neighbors. They might do it once, but eventually the test of actual, personal service must come and the readers will "please themselves."

I was one of the younger set of boys who whooped it up for Uncle Sam in the 'sixties, but who came home and dug hard for a living till rheumatism and heart-weakness laid me out. I am not a disgruntled old grouch, but a man fond of good literature, music and flowers, and little children, jokes and friends. Being very deaf, I have to depend on myself for ways to be entertained, which is why I take THE R. N.-Y. J. H.

Ohio.

This old veteran gives us all a text for a living sermon. Here is a man who makes "happy days," into which even these severe afflictions cannot enter. Some of us who fancy we are greatly abused may think we are justified in playing the part of a "disgruntled old grouch" during 1914. Let the thought of this brave old soldier enable us to cut that "grouch" out. "Happy days!" We might fill the paper with these original texts, but here is one more:

"I take THE R. N.-Y. *because it is the paper with a conscience and a punch."* W. H. M.

Connecticut.

Can anyone have an enduring "punch" unless there be a conscience back of it? Can any conscience be worth a single thought unless it can start a hard punch at some evil? We think that a "punch" with merely cold-blooded reason or some personal motive back of it would do far more harm than good. *"Conscience and a punch!"* What a motto for those of us who want to have a hand in the great things which open up for 1914. We shall all enjoy working on together—*"Happy days!"*

*

THE "tree dopers" are at work again. These fellows offer to cure a tree of diseases and fix it so the scale and other insects will not work by "inoculating" it. Their scheme is to cut a little hole in the bark and poke in a capsule or pill containing some mysterious powder. Then the wound is waxed over and the tree left to cure itself. These fakes charge 10 cents or more per tree, and can dope 250 trees a day in a large orchard. It is plain daylight robbery and nothing more, yet these fellows are now at work in Pennsylvania and Maryland, making more dishonest money in a day than the average honest man can make in two weeks. The scheme has been exposed again and again, yet people continue to bite at this old fraud. We know an educated man who had an argument with one of these fakes. The tree doper showed a newspaper clipping which showed how one man had given his blood into the veins of another! Then he told how doctors vaccinate to prevent smallpox, and use a toxin in cases of diphtheria, and of wonderful consumption cures through inoculation, and of feeding sulphur to sheep to kill the ticks. "Now," he said, "if these scientists can do all this by inoculation, I can do the same things through the sap of a tree!" That is the sort of logic these scamps are using, and it works the money out of many a pocket which cannot stand the loss.

THE last issue of the Tribune Farmer contains this statement:

With this issue the Tribune Farmer closes its career as a distinct publication. It has been purchased by the proprietors of THE RURAL NEW-YORKER, who will hereafter merge it with that publication. * * * Subscribers to the Tribune Farmer will receive THE RURAL NEW-YORKER to the expiration of their subscriptions to The Farmer. Persons who are now subscribers to both papers will have their subscriptions to THE RURAL NEW-YORKER extended for the period covered by their subscription to The Farmer.

We now confirm this agreement and take great pleasure in welcoming our new readers. This is the first issue of THE R. N.-Y. which goes to Tribune Farmer readers under the new arrangement. While old readers will naturally regret "the breaking of home ties" and separation from their old friend, we hope they will feel in a measure, at least, compensated and satisfied by such service as we can give them through THE R. N.-Y. We find that many farmers have been reading both papers. Their subscriptions have been extended by agreement, and we need not give them a special welcome.

To newer readers we may say with sincerity that we welcome this material increase to what we call the Rural family. We want you to feel at home at once and permanently. Call on us whenever we can be of any service to you. Tell us your needs, and we will do our best to meet them. Let us work together to make the New Year a happy and prosperous one. We cannot hope entirely to replace your favorite old friend in your affections, for we know what these long-time friendships mean. We hope, however, to win a permanent place in your lives and in your homes.

*

FOR the past few years the "two blades of grass" men have worked their theory very hard. They only needed an audience to argue that the farmers of this country would all get rich if they would only double their crops. Sometimes, when they could not get an audience, they talked to themselves. At one time they seemed to have the colleges and stations and most other agents of agricultural education going their way. We have claimed from the beginning that this "two blades of grass" theory would be the finest thing for the carriers and handlers, but the poorest thing for the producers. These carriers and handlers are able to collect fixed charges per pound or measure. When they handle 100 cars they naturally collect twice as much as when they handle 50 cars. When the farmers produce 100 cars they find that the extra 50 will be used to beat down the price of the original 50, and the more they produce the less they receive. We have proof of this in a recent statement from the Department of Agriculture. Here are the comparative figures of crops for two years in the country:

	Total crop—		Total value—	
	1913	1912	1913	1912
Corn.....	2,446,988,000	3,124,746,000	$1,692,092,000	$1,520,454,000
Potatoes...	331,525,000	420,647,000	227,903,000	212,550,000
Tobacco....	953,734,000	962,855,000	127,481,000	104,063,000
Hay	64,116,000	72,691,000	797,077,000	856,695,000

Thus with smaller crops of corn, potatoes and tobacco than last year, our farmers obtained over $200,000,000 more than they did for the larger crop. With a smaller hay crop the average ton brought 75 cents more. Now what on earth would be the inducement for the farmers of this country to double their production at increased cost and secure less for their crop? We think these "two blades of grass" men see the point. At any rate there are 100 men driving this thought home where one was doing it 10 years ago. Cut out the "two blades of grass." Make it possible for the farmers to get a 50-cent dollar for the one blade, and it will feed the nation like the widow's cruse of oil.

BREVITIES.

YES, a mossbacked soil usually needs lime.

TRY a little Alfalfa seed when you sow Red or Alsike clover.

WORCESTER COUNTY, Mass., has an Alfalfa Club. What about your county?

THE Wisconsin Dramatic Society will present "The Book of Job" as a drama. Job ranks in history as the patient farmer.

THE residue from acetylene plants is a wet, slaked lime. It may be used wherever lime is needed. There is nothing injurious in it as usually found.

WE should be careful about buying chestnut timber. The blight disease has killed many chestnuts, and these dead or dying trees are being cut up for lumber.

BE sure to follow the articles on acid soil. Some of us may be trying too hard to fit our soils for alkaline crops, when others will do well on our acid soils.

SEVERAL New York dealers in barbers' supplies have been convicted and fined for selling "bay rum" which contains wood alcohol. It seems that this stuff is quite largely used by barbers, yet whenever it comes on the face there is danger of entire or partial blindness.

THERE is no doubt that many a farmer has toiled for years without fair reward, because he kept on trying to produce something which was unsuited to his farm and his own powers. The man's soil was not well adapted to the crop. He did not feel any enthusiasm for it, and thus did not study it all through and analyze its possibilities. Then it may be that some other part of the country, more favorably situated, had come into competition on terms which he could not meet. In the face of these things a farmer cannot hope to succeed by going on in the same old way. No other business could stand it half as long as farming. In some cases the trouble between father and son is that the boy sees this when the older man does not realize it. The boy, however, lacks father's experience and caution, and does not have the patience to go slowly and prove his case. He cannot expect father to give up the habits of a lifetime without some sort of demonstration on a small scale.

*

SOME of the fruit and truck growers of the Southwest have during the past few years been selling a portion of their products in a manner that cuts the cost of distribution down to zero. When a car is ready for shipment, instead of being sent to some overstocked market center, it is billed to a small town in the adjacent territory, which is known to be in need of that particular variety of fruit or truck, and a representative is sent along to sell the products direct from the car door to the consumer. Peaches, apples and sweet potatoes have been most successfully sold in this way at a cost—outside of the freight—of about 10 cents per bushel. This plan is not entirely new. A Missouri fruit grower some years ago, in a time of glutted apple crop, "lived in a freight car" for several months. He took out load after load for his neighbors, and sold direct from the car door. Many of the people who bought never would have had apples if this man had not come to them, while his apples, left at home, would have rotted on the ground.

*

No question about the size of this problem of the city boy and the agricultural college. We are surprised to find how many city boys are attending these institutions. Wisconsin is one of the most progressive farm States, yet about 50 per cent. of the students in the agricultural college come from the larger cities. Most of these never had previous farm experience. Now the city boy has just as much right at the college as anyone else. As a rule, he is better prepared than the country boy, for the best high schools are in the cities. Yet the city boy lacks one thing, which we regard as absolutely essential either to the farmer or to the teacher of agriculture. That is a knowledge of practical farm work and a broad sympathy for farm conditions. The lack of these things is a handicap for the city boy. Filling the colleges up with boys carrying this industrial handicap will, in time, handicap and embarrass the colleges. In the very nature of things these colleges cannot perform their work of educating farmers properly if their raw material have no genuine farm flavor. Professor Wright tells us how they handle the problem at a secondary school. There seems to be need of a requirement for actual farm labor.

*

As a result of the hearing on the potato situation, Secretary of Agriculture Houston has extended the quarantine. After December 24 no potatoes will be accepted from Europe, Great Britain and Ireland, Canada or Newfoundland. This practically shuts off all imports. Shipments already invoiced will be received up to January 15. Secretary Houston says there are potatoes enough in this country to supply all. The last crop is above the 10-year average. He says:

The price of potatoes in centres of origin is still reasonable or low and the problem seems to be one merely of distribution. The tests from all parts of the country as given at the hearing was that no shortage exists at present above the usual market demands, but that the supply in farmers' hands is very large. Farmers as well as dealers denied the charge that speculators had acquired control of the potato crop. Farm prices have been low for some weeks.

For the past two months a systematic effort has been made by speculators to frighten the farmers into giving their crops away. Stories about "floods of foreign potatoes" in the Atlantic Coast markets have been circulated when retail prices here were as high as ever. Several wild men have been telling the daily papers that potatoes will go to $6 per barrel. The market should now settle to a normal condition. Farmers will do better to sell out at a fair price rather than hold for speculation. Our own plan of selling farm produce is to know as accurately as possible what it costs to produce, and then sell on a fair margin when the price rises to it.

Now that direct trade and parcel post shipments are developing, farmers cannot possibly be too careful about grading and packing their goods. It is a great mistake to ship culls, or to think that any kind of packing will answer. Here is an instance. One of our readers told us that in his city there was a good demand for apples, and that he could handle some good ones to advantage. We got him into communication with another reader in a section where the local market was poor, and a trial shipment was arranged for. This is the report:

The stock was packed loose in both barrels and boxes; barrels were short from one-half to one peck. Apples in boxes were not packed, but just poured in and cover nailed on. They were good color, but were not box grade; would caliper about two to 2½ inches. Apples brought $4 and $4.50 a barrel; $1.75 per box. He allowed me 25 cents per barrel and 10 cents per box for selling, and I spent two days and $1 looking after shipment, which was mis-ronted, and selling apples. We found he had shipped with sight draft attached to bill of lading, no permission to inspect. The firm I sold to is one of the best. It's the old story of the "cull in the package." Three or four dealers would have bought his entire output or stock if goods had been right. One said, "If the goods are all right I'll take 50 barrels and some boxes." Barrel stock was fairly good in size, but most of it looked as green as if it had been picked a month too soon.

Now we notice this case to make it as clear as possible that direct trade will require the most careful selecting and packing. The commission man would return a low price for such a lot of apples and then repack and make more by doing so than the farmer did out of the entire shipment. We must all remember that the more direct the trade the greater the responsibility which goes with it—for that is what the buyers pay for.

*

SULPHUR AS A FERTILIZER.

FOR many years the scientists taught us that three elements, nitrogen, potash and phosphoric acid, were all that we need worry about in fertilizing ordinary soils. The other elements needed to build up the plant were supposed to be present in average land. Then came Dr. J. H. Wheeler's exhaustive work with lime, and the trio of necessary plant food elements became a quartet. It became evident that all over the Eastern States, at least, from the very nature of the soil, lime was fully as necessary as potash or phosphoric acid. Now comes the proposition that we must make the quartet over into a quintet, and accept sulphur as another indispensable element, to be used in our fertilizers and manures. Last year we made a statement of the arguments for sulphur. Up to within a short time ago the scientists were figuring upon an entirely erroneous basis. They figured on the amount of sulphur contained in the ash of various plants, and somehow assumed that what they found in this way represented the total requirements of the plant, the same as of lime, potash and phosphoric acid. Then they found that while lime, for example, might all remain in the ash of the plant after burning, a portion of the sulphur might be driven off in sulphur fumes, and thus not show in the ash. Analysis with improved methods proved the truth of this assumption. For example, Alfalfa hay showed in its ash .17 of sulphur, while with the improved method there was .28. Turnips showed .35 in the ash, .74 when all was recovered. The differences found in other crops was even greater, and it became evident that many of our cultivated plants contain more sulphur than they do phosphorus. For example, a crop of turnips contained about 40 pounds of sulphur, and 14½ of phosphorus; while a crop of Alfalfa hay contained 26 pounds of sulphur and 17 pounds of phosphorus. The Kentucky Experiment Station has been investigating the soils of that State, to study their content of sulphur. We shall give a full description of this work. Briefly stated, it was found that in the majority of Kentucky soils there has been a great loss of sulphur as the result of cultivation. Most of the crops grown in Kentucky require as much sulphur as they do of phosphorus, and almost without exception they have been slowly drained of the sulphur which they contained when they were new. A small amount of sulphur is brought down each year through the rain and snow. This sulphur is put into the air in smoke and fumes from fires and factories, and on the average something like seven pounds is brought to each acre by the rainfall. The loss of sulphur by drainage is greater than that of other forms of plant food. While very little of either potash or phosphoric acid will usually be found in the drainage waters, large quantities of sulphur are washed out in this way. Experiments in Kentucky appear to show that the sulphur problem is a serious one; that the soils of that State are being depleted of that element more rapidly than of other forms of plant food, and that the crops grown upon that soil require as much sulphur as of the other mineral elements. It is now thought by some of our scientific men that the former beneficial effects from the use of land plaster were due in part at least to the sulphur which this sulphate of lime contained, and the results of these experiments may be a revival of the old use of plaster. We shall give a full statement of the work of these experiments. They are not yet conclusive, but they do show evidence that in the future our farmers must consider the problem of using sulphur as a fertilizer, either in such forms as acid phosphate, land plaster, or in some actual form of sulphur itself.

*

A SYNOPSIS of the new currency bill is printed on page 6. It is a complicated measure, designed to prevent, if possible, the concentration of money into two or three favored localities. Federal reserve banks are to be established in at least eight or possibly 12 sections. The control of these banks is to be safeguarded as far as possible by the Federal Government, and it is expected that these banks will become headquarters for general banking business in their respective sections. This ought to prevent piling up of money and final credit in a few favored localities as at present, and bring money out closer to local business. The law permits National banks, under certain conditions, to make loans on farm property and discount notes or drafts made on live stock or farm produce. The theory of the new law is sound and helpful. It may need modification before it will work properly, but it ought to bring about a more even distribution of banking money and better opportunities for obtaining credit through farm property. Such a bill as this should not be made a political issue between political parties. We are glad that on the final passage of the bill party lines were broken down—partly at least. There has been a hard fight between the banking interests and the money-borrowing classes, and both finally were forced to abandon some of the things they originally demanded. There is now a general disposition to give the new law a fair trial, and both sides, while stating that they are not fully satisfied, generally agree that the law is an improvement over the older one. The New York *Times*, organ of the banking element and of the never-changing conservatives, says of the bill:

The public and the bankers now accept the bill hopefully, not because they have in any way changed their attitude toward it, but because the bill itself has been changed, in a multitude of ways, and immensely, for the better. * * * Just as Congress worked under public supervision in making the bill, so the acts of the members of the board will every day be subject to scrutiny, and against any flagrant departure from sound principle the public protest will be so instant and emphatic as to compel a return to the safe path.

The hopeful thing about that is the admission that hereafter the public will take a hand in the enforcement of a financial law, and not leave it to a few rich men plotting in a private office.

Foreign Crops.

The Liverpool *Corn Trade News* reports:

United Kingdom.—The weather and crop outlook are generally favorable.

France.—The weather is seasonable and the crop outlook is mostly favorable. Supplies have increased materially, but offers of native wheat have practically stopped. Buying of foreign wheat continues.

Germany.—The crop outlook is generally favorable and the weather seasonable. Offers of native wheat are larger and therefore the trade in foreign wheat is dull. Best informed interests here predict that there will be a revival of foreign buying in January, as stocks are light.

Russia.—The crop outlook is generally satisfactory. Supplies are liberal. Most of the wheat area is covered with snow.

Roumania and Bulgaria.—Ontlook favorable, with supplies of native wheat liberal. The weather is too mild.

Hungary.—The weather is cold and there is no snow and apprehension is felt regarding the effects of freezing.

Italy.—The outlook is favorable, with the weather seasonable.

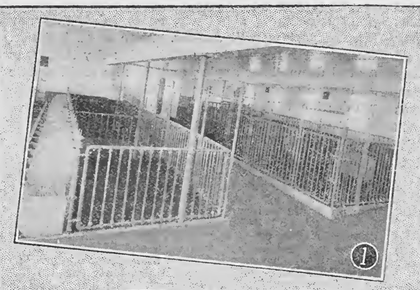
Spain and North Africa.—Dryness continues, and although there has been light rain it was not sufficient.

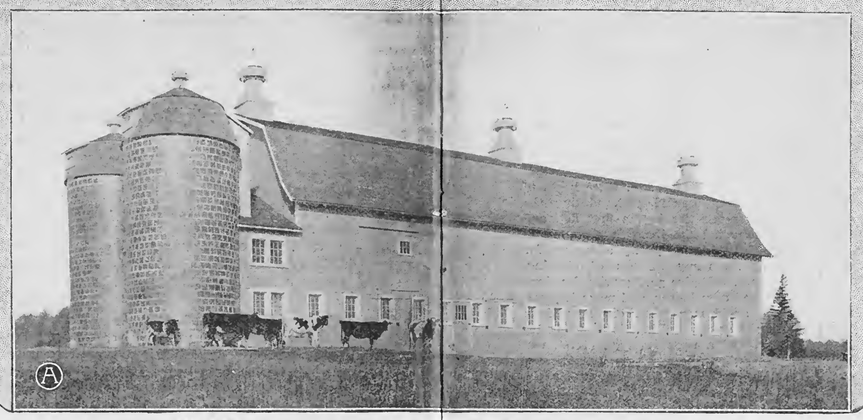
Australia.—High promise has been maintained and our agent reports that the exportable surplus may be 20,000,000 bushels over last year.

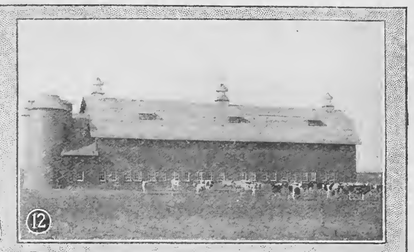
Canadian Crops.

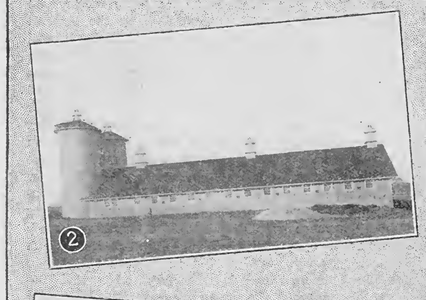
The Ontario Department of Agriculture gives the following figures of yields in the Province this year:

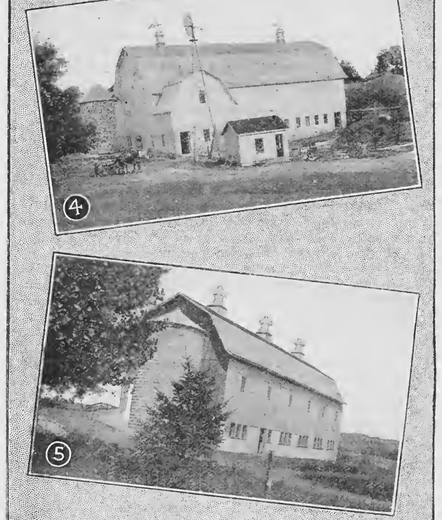
	Acreage	Bushels
Fall Wheat	646,533	15,945,717
Spring Wheat	116,581	2,068,951
Barley	623,658	18,255,958
Oats	2,699,459	98,426,902
Rye	118,429	1,979,775
Buckwheat	228,279	4,012,418
Peas	117,303	3,108,263
Beans	66,639	1,021,243
Corn, Ear	269,871	22,214,014
Corn, Silage	388,138 tons	
Potatoes	159,661	19,124,115
Carrots	2,400	592,016
Mangels	54,568	21,935,847
Turnips	97,572	41,889,894
Hay	3,428,846 tons	3,924,563

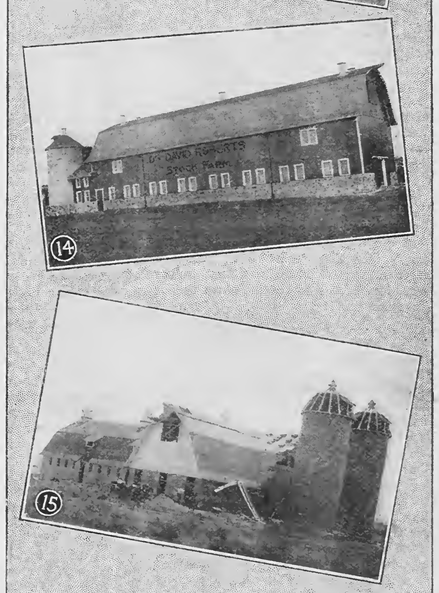


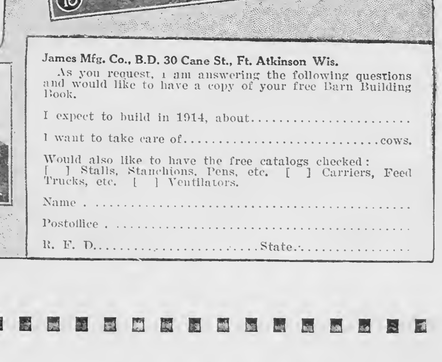


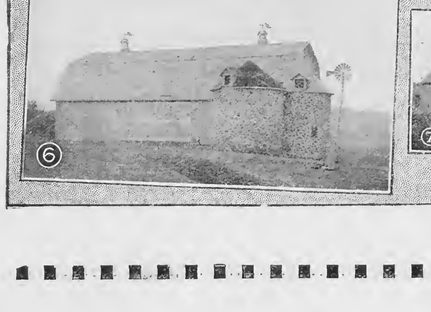


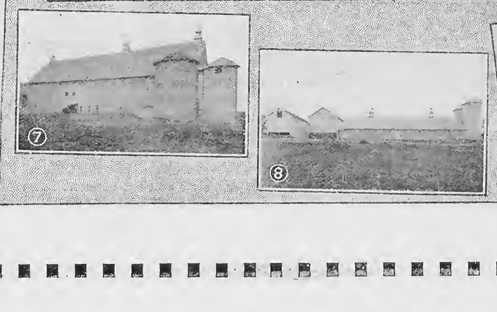


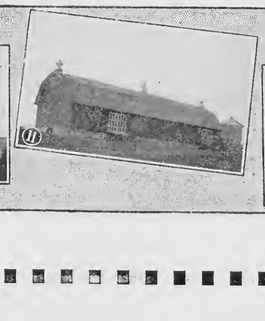












Some of the Successful Barns Designed by JAMES Experts

On this page we show a number of the JAMES barn successes—with names of their owners and their locations.

Exterior "A" and interiors "1" and "2." Barn of Browne & McMillan, Milwaukee, Wis., at Waukesha.

1 and 11 Waukesha, Wis., County Asylum Barn.

2 City of Cleveland Barn (Cooley Farms), Warrenville, Ohio.

3 Experimental Barn, James Mfg. Co., Ft. Atkinson, Wis.

4 and 6 Roloff Bros., Delafield, Wis.

5 Anton Ericksen Barn, Argyle, Wis.

7 Barn of Nashotah Mission, Nashotah, Wis.

8 T. B. Clark Barn, Honesdale, Pa.

9 Barn of Jewish Protectory and Aid Society of New York City, at Hawthorne, N. Y.

10 Barn of Mrs. W. A. Carpenter, Ft. Atkinson, Wis.

12 Wood County Asylum Barn, Marshfield, Wis.

13 Barn on Galloway Farm, Waterloo, Iowa.

14 Dr. David Roberts Barn, Waukesha, Wis.

15 St. Mary's College Barn, St. Mary's Kas.

16 Peter Reiss Barn, Sheboygan Falls, Wis.

17 Hollywood Farms Barn of F. S. Stimson, Seattle, Wash.

18 Fred Knaisch Barn, Buffalo, N. Y.

Money = Saving Plans for Good Barns

ALL barn *profits* begin with the plans.

A barn properly planned and built is a constant money maker, because it saves time, labor and feed every day it is used; and it will cost you no more than the same size barn poorly designed and inconveniently arranged.

A correctly planned barn adds to the value of your *farm*, and means a better price if you want to sell. The average farm buyer looks at the improvements *first*. The right barn plans will give you a better barn from the standpoint of looks, and more important still, from the standpoint of convenience and cow comfort.

For proper lighting, good ventilation, easy disposal of litter—floor space used economically and to best advantage so that time and labor will be saved in cleaning and feeding—a barn *must* be well planned at the start.

A good barn adds to the selling value of your cows—makes them show off better—makes them healthier and finer looking.

A *good* barn puts more value on a farm than anything else of equal or even greater cost—and the good barn requires no larger investment than one that might be full of expensive mistakes.

A barn planned wrong will lose money for you every day.

The wrong design of frame—inconvenient arrangement of feed bins and feed rooms—incorrect arrangement of carrier tracking or the wrong location of posts may compel you to take more steps—do more work and pay out more money for help each day throughout the life of the barn.

One window left out—a silo in the wrong place—a door that is not right—poor arrangement of stalls—intakes or outtakes improperly installed—mistakes in sizes of platforms, gutters, passages and alleys—even these small details may be a source of daily expense.

But all these items are *right*, in a barn planned by experts who know *dairy barn needs* down to the smallest detail.

If you intend to build a new barn or remodel your old one, avoid all the mistakes of poor, carelessly made plans. Accept the advantage of *proper* barn planning, and

Let JAMES Help You Plan Your Barn This Winter

JAMES barn plans represent all the biggest and best ideas in all the best barns built in every section of this country. In all the barns we design we incorporate the most valuable suggestions obtained from the thousands of plans which come before us every year for our inspection and criticism. So that JAMES service represents not only the original work of JAMES experts, but the results of our contact with barn conditions everywhere.

Get *your* plans and specifications *now*—while your time is not taken up with other work—while you can give the proposition the thought and consideration it deserves. Eliminate mistakes by having each point carefully worked out before the *final* plans and specifications are prepared.

You can then submit final plans to several contractors, and if all the bids are unsatisfactory you can reject them, call for new ones, and still have time to get the work finished when you want it.

By having as many sets of JAMES plans and specifications as there are contractors to bid on your barn, you will *save money* in building—as bids generally vary hundreds of dollars. JAMES blue-prints and specifications make it safe for you to accept the low bid, because the successful bidder must follow directions as to construction, workmanship and materials.

Remodeling Old Barns

We also have made a thorough study of remodeling old barns, so that they will make conditions as sanitary and the labor of caring for the cows as easy as possible under existing conditions.

One of our very successful remodeling jobs was on the dairy barn of the Kansas State Hospital at Osawatomie. Mr. Charles H. Chandler, state architect, says the manner in which we laid out the building was "the most economical that could be employed and will accommodate the largest number of cows."

Barn Plan Service FREE

For many years Mr. James and his assistants have made a careful study of barns, and have planned hundreds of the finest and most successful in this country. Some of them are shown in this advertisement. Dr. David Roberts, of Waukesha, Wis., writes us about "the splendid outlines" of the barn we planned for him. JAMES barns are *good inside* and *good looking outside*.

Fred J. Schleef, of Lodi, Cal., says his JAMES plans and specifications were "exactly what he wanted."

Cyrus Reimer, Sales Manager of the American Fork & Hoe Co. at Cleveland, Ohio, says that if he were to build a dozen more barns he would not change from the JAMES plans, and believes he has "as good a barn as stands in America."

We have many other letters of a similar nature—and can point you to *money-making* barns built according to JAMES plans in every part of the country.

James Service Covers Everything

Our knowledge of good barns covers construction and equipment, also lighting, ventilation, location, drainage, etc. In this connection, T. C. McMillan, of the firm of Browne & McMillan, of Milwaukee, Wis., for whom we designed the large barn shown above, says:

"It will no doubt interest you to know that we have completed and are now occupying the new cow stable built to per your plans and specifications and we are putting it very mildly when we state that this barn comes up to our expectations in every respect. We feel that with the advanced ideas which have been incorporated into it through the excellent service rendered by you, we have a stable that will be modern for many years to come as we are satisfied the best of foresight and judgment has been extended in the planning. In conclusion we wish to express our appreciation of the able and courteous manner we have been handled by your various department heads, which our dealings have brought us in contact with, and assure you that we are advocates of the JAMES way of doing things."

It will *pay you* to take advantage of the knowledge and experience of the JAMES organization.

Advice and Counsel Absolutely Free

A service that will help you greatly is absolutely *free* to you. We offer you the benefit of Mr. James' wide experience. We want you to know that valuable counsel is yours without cost, and we will appreciate a letter telling just what your own ideas are—when you expect to build, how many cows you will take care of, etc.

Your letter, postal card or the signed coupon will be personally answered, and every question you ask will be given most careful attention.

Save Money by Starting Early

And don't forget the value of an *early start*—because you know a contractor always figures lower on an *early* job, when work is slack, than he will after his rush season begins.

Get the Barn Building Book—FREE

When you can have a *good* barn at a cost no greater than probably some of your own neighbors have paid for poorly planned ones, *why not have it?*

Write today—and learn what JAMES can and will do for you. If you will fill out the coupon, we will send you the JAMES Barn Building Book postpaid.

Woman and the Home

From Day to Day

NEW YEAR'S DAY.

With mirth and joy the New Year comes again,
Fair aspirations hover in its train,
And golden hopes of peace and righteousness
That show the good to which we might attain.

Why lingers Peace? Why groans the weary earth?
And why 'mid splendors do men die of dearth?
How long for harvest must the sowers wait?
When shall the longed-for New Year Day have birth?

Be patient, brother; let us do our best,
And strive amain at Brotherhood's behest
To raise the fallen and to cheer the weak;
And leave to rip'ning Time and Heaven the rest. —W. E. A. Axon.

*

In a breadmaking contest in connection with the farmers' institute at Oberlin, Kan., Leta Moore, aged seven, made bread that was given a score of 91 by the judges. A seven-year-old bread-maker is certainly a wonder, when she can attain such a score as this.

*

Making a large batch of fruit cake is a toilsome process, because of its weight and stiffness. After butter and sugar is creamed, and eggs beaten, ours is mixed in the bread-mixer, which incorporates the materials thoroughly, with a great saving of labor. After putting into the tins, our fruit cake is steamed for two hours, and then baked in the oven one hour. This insures the proper cooking, without drying it as hard as a paving stone, and there is a fragrant richness of flavor that is very desirable. The steaming may be done just like brown bread. One of our friends does this in a closed baker, with about 2½ inches of water in it. She puts the cake in the usual tins and ties cheesecloth over the top to prevent drips of steam from falling on the dough, then closes the baker. This is a practical way of steaming things in the oven, leaving the top of the stove vacant for other cooking.

*

We made reference recently to the new vegetable, dasheen, which may be grown in the South as a substitute for potatoes. The Department of Agriculture gives the following recipe for using dasheens as a dressing for poultry: Two parts of riced dasheen, one part of bread, one egg, butter, according to quantity of above. Season to taste with salt, pepper, sage and onion. The dasheens should be boiled and riced in the same way as are potatoes. We wonder whether any of our readers have used the tubers of Jerusalem artichokes in this way? In our experience they have been but little used in the household, though they are easily grown, and prolific enough to be troublesome in a great many localities. The dasheen is said to have a pleasant nutty flavor. We have never been able to acquire a personal taste for the Jerusalem artichoke. It has often been urged as a substitute for potatoes, and is likely to come up again with the quarantine against the latter vegetable, though rice is always available as a cheap and nutritious potato substitute.

*

One of our friends, who is much interested in household art, says she always starts to decorate a room by taking a lot of needless "junk" out of it. A good many houses present an opportunity for such reform. We may multiply ornament until we lose real beauty. Nowadays decorators are going back with enthusiasm to the Colonial period, eliminating all sorts of gimcracks, and adopting the simple lines and severe ornamentation of the eighteenth century. When we study the restful effect of a Colonial interior we notice that comfort and usefulness predominate over ornament; that there is no multiplicity of adornment. Perhaps the ugliest period of house decoration was during the seventies and eighties, a time when woman's dress reached an acme of ugliness too. In arranging a country home, we can get some ideas from the Summer homes of city people in mountain or seaside resorts, and the old-fashioned simplicity of Colonial times, or the modern "craftsman" type are both suggestive models. Comfort and beauty need not mean great cost; it is the "know-how" that is needed. We have got away from nailed-down carpets and multitudinous tidies, and it is a propitious time to study for beauty, as well as comfort and convenience, in the farm home.

Heating Upstairs Room.

In a recent issue you asked for information regarding the more effective heating of stoves. Certainly a large part of the heat goes up the chimney. We have solved the problem by attaching a radiator to the pipe. This makes the second floor room nearly as comfortable as the first. The radiator idea is a good one also where furnaces are being placed in old houses where there is no chimney to the cellar, and the smoke pipe has to pass to the second floor. The radiators may be purchased for from $3 to $12. Ours cost $6. M. H. L.

Lard Does Not Keep.

Will those with experience tell us why our lard becomes rancid by early Summer? One gallon crock, often used before, kept perfectly sweet till early Fall Some of the lard was put in new tin pails, at time of rendering, but was not fit for use. H. M. B.

Trying Out Leaf Lard.

Instead of cutting up the leaf lard in pieces and then being obliged to squeeze the lard out when done, try this way: Put the leaf lard through the meat grinder, using the coarse knife. Fill the kettle nearly full, with a little water. Put on cover, stir occasionally and when done there will be no moisture on the underside of cover. Pour all ont into cheesecloth, put in colander over the jar, the scraps will drain dry and will not need to be sqneezed. They are in nice shape for either using in cooking or for feeding chickens. I found this plan worth much to me. I can try out 50 pounds of lard and make same amount of sansage in a day, whereas it took two or three days the old way. C. M. B.

Old-fashioned Apple Dumpling.

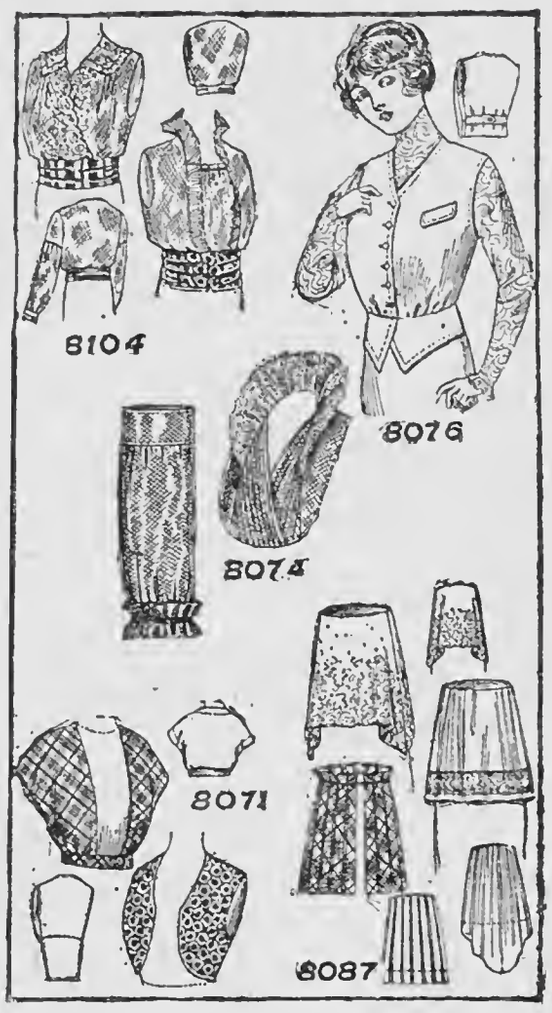
F. J. F. F. asks for a recipe for apple dumpling. I remember as a child after a walk of a mile, how fragrant the kitchen was when mother had apple dumplings for supper, which was at five o'clock, after our cold lunch at noon on school days. These were often made when the old-fashioned boiled dinner was cooked. And no dinner ever seemed like those. But we must remember that there is nothing like mother, and never fail to appreciate her. My own mother was taken from us when I was 18 years old, leaving me as housekeeper and mother to the children, two brothers and a motherless little cousin who lived with us, and today my heart often aches as I see children treating their mother with scant respect; not children alone, but young people who seem to forget the patient loving mother ever ready to give, with nothing given in return. These apple dumplings were made as follows: One cup rich buttermilk, one teaspoon salt, one teaspoon soda (scant) dissolved in hot water, two tablespoons melted butter. Flour for stiff batter that can be spread with spoon in a buttered basin. Spread a thin layer of dough, then a thick layer of apples sliced thin, dot with butter and cinnamon, cover with the rest of the batter, steam over kettle two hours. It will be white, puffy, and delicious; served with sugar and cream.

Another equally delicious dish was cornmeal pudding boiled in a bag. This usually also accompanied a dinner of boiled ham or pork and was made by using one cup buttermilk, one spoon salt, one egg, one small spoon soda in water to dissolve. (Too much soda causes a yellow tinge and disagreeable taste.) One cup raisins rolled in flour. Thicken with one part white flour and two parts cornmeal sifted (not bolted meal) until like fruit cake, and two tablespoons melted butter stirred in last. Tie up bag, place in a roomy bag, giving place to expand, and lay on the meat in the water it has cooked in and boil abont one hour. Serve with sugar and cream. This may be steamed if preferred as the dumplings were. MRS. JAMES LAMPMAN.

The Rural Patterns.

When ordering patterns always give number of pattern and measurements desired.

8104 Guimpe with or without sleeves 34 to 42 bust. 8076 Waistcoat in three styles, 34 to 44 bust. 8074 Waist garniture with under sleeves, one size.



8071 Sleeveless over-waists in bolero and jumper styles, 34 to 42 bust. Bolero to be made with coat back or finished at waist line. 8087 Set of tunics, 22 to 30 waist.

8089 Boy's suit, 4 to 8 years. 8077 Boy's single-breasted overcoat, 8 to 14 years. 7914 Girl's Russian dress, 10 to 14 years. With two-piece skirt, scalloped

or straight edges, elbow, three-quarter or long sleeves. 7235 Girl's yoke apron, 6 to 10 years. With high neck with or without collar, or with square neck, with or without sleeves. 7956 Child's feeding apron, 1, 2 and 4 years.

Who Can Dress on $15 a Year

Sometime ago a writer in a woman's periodical mentioned $15, as a yearly dress allowance. One woman asserts that she considers herself well dressed upon that amount—wears mittens and a hood during cold weather, and a cape costing less than $10, and lasting some six or seven years. The woman who can hide herself in a big city; or take to the woods, or is so situated and sonstituted that she can keep her best dress in the closet, and her best hat in a box, can dress on a very small income. She may be a law unto herself and dresses as she pleases. But for the woman who goes among people, and keeps somewhat in touch with the prevailing modes and respects at least a few social demands, the adjusting of her needs to so limited amount of money as $15, is indeed an impossibility. Women having had the benefit of a liberal dress allowance, can at a period demanding no heavy outlay, dress for a few years upon a surprisingly small amount of money, and remain well dressed; but when the time comes for a really good garment then it is that the purchasing power of the small income merges from the experimental stage.

The greatest possible help towards dressing on a small income, comfortably, and according to business and social demands, is to take a careful inventory of clothing, once a year during the month of December, then make out, not one list, but three, a list for each three years to come with estimated cost, placing the pressing necessities in the first list, and then adjusting the items in each list to harmonize with the yearly allowance for dress. So many articles of clothing, with care, will give good service for three years and even longer, and make it possible to avoid more than one large item during one year, and in this way a better article, and a more lasting material can be secured. Unless a woman knows the full extent of her dress wants for the coming year, she cannot possibly know how much money she can invest in any one garment. For instance, a very small allowance can only carry two large items, the best dress and the Winter wrap, during a period of three or five years, and the amount that can be invested in either, must leave from the allowance a balance sufficient for all the other necessary dress items for the whole year.

If a woman with a small income should by fire or flood, be deprived of all her clothing, she would be obliged to take advantage of cheap material in order to be comfortably and presentably dressed. But with more or less of clothing at hand—to spare the new—there is no economy in cheap shoes, black dress goods, or hat trimmings. Wool dress material less than 42 inches in width and one dollar a yard is a questionable investment for street wear, when a skirt pattern can be adjusted to wide goods, requiring only two breadths, or two skirt lengths for a plain walking skirt; and one yard and a half for a waist or a short jacket. Good felt, or straw hats will each last three seasons; and good satin finished trimmings from three to five years. One pair of $3.50 shoes a year, for two years, will last three years if re-heeled and re-soled, and shoes of that quality—the welt sewed—will stand repairing and never need an apology. Black brilliantine from 50 to 70 cents a yard makes an economical and most satisfactory petticoat for the housewife, and the business woman, for best and for every day wear; $5 worth of Winter underclothing with good laundry care and mending, should last three Winters, and $3 worth of knit cotton garments should last three years. As no two women dress alike, or need the same amount or kind of clothing, it is not thought helpful to consider more than a few items of dress. Every woman should for herself, discover between necessity and desire; and discriminate between cheap goods and expensive goods; and so far as she can confine herself to the standard grades, with prices that vary but little from year to year, that she may be able to look ahead and to estimate her wants and the costs, and thus have the full benefit of the purchasing power of her small income.

MEDORA CORBETT.

A Candy Suggestion.

The article on homemade candy by Rosamond Lampman, on page 1371, was fine, but I wish to add just a bit that will aid the candy maker greatly. When ready to dip the molds for the chocolate place in small saucepan two good-sized tablespoonfuls of butter to one quarter pound bitter chocolate. Place right on stove and stir constantly until chocolate is melted. It is not necessary to cut chocolate in pieces unless desired. When too cool reheat again. The result is delicious, and as it makes the chocolate thinner expedites dipping greatly. I have made Christmas candies for years, but just thought out this idea recently.

M. H. L.

Over the trackless past, somewhere,
Lie the lost days of our tropic youth—
Only regained by faith and prayer,
Only recalled by prayer and plaint;
Each lost day has its patron saint!
—Bret Harte.

The Farm Well.

I wish some practical man would write sometime on the subject of wells on farms. I know that many modern farm homes have water systems, but homes are scattered about, where the wells seem to have been dug in the most inconvenient places. These old houses will outlast those being built now, and, while the owners have wells dug "down at the barn," and in the house pay for some modern touches in the way of windows, porches, and the like, they consider it a very extravagant idea to dig a new well, but women folks continue to carry their water the length of the back porch, or the front yard, near the roadside, where the travellers in the old days through the thinly settled country, used to stop for a refreshing drink.

My nearest neighbor, who owns his farm, and has a large mortgage on the next one, has one of those roadside pumps. In addition, the house, which is on a hill, must be reached by a flight of six steps, and the width of a porch. I do not deny that it is the women who are unbusinesslike in this matter. They do not count wasted energy in such matters. There is one patient soul near by whose men-folks were not handy with tools, who waited for years until the old farm house needed re-roofing, before she asked to have built a few shelves which saved her many, many steps to and from the pantry.

I have heard women say that when they built a house, they would begin with the kitchen. When I build a house, I shall begin with a well. L. S.

Windows and Draperies.

I am glad that country women are not so much "given" to the craze for window and door draperies as city women are. In some city homes, after seeing the draperies at transoms, doors, and windows, one is almost surprised if no attempt has been made upon the skylight. But it was in a farm home where I recently saw three sets of window draperies at each of the living-room windows, and heavy, woolen portieres at the doors. Plants were not thriving in the room. They did not actually die, for, although they did not have sufficient sunlight, yet they were "tended." Did not the condition of the plants give a warning for the children who spent part of their time in that room? Was not the man of the house about right, when, after looking wonderingly for a few minutes at the dainty net and Swiss, he asked: "Mother, what are those things, anyway, just pretties'?"

I consider that we need window shades; also that draperies may be beautiful and artistic, but I think they should not be used in those rooms which are in everyday use. In our living-rooms we need light and sunshine and ventilation, and if dainty materials are hung at the windows, we are too apt to think of the effect upon them. I have been in houses where women have had doors made half glass, so as to see the glass daintily draped.

A country woman should prize her views. I should say she would be more cheerful and more efficient if she were to spend her drapery money in adding more windows. From personal experience I know that a good clear window, in the right place, can almost save a doctor's bill. My kitchen had only one window and that was placed where I could not see out of it without leaving my work. As I worked at my cook-table or stove I often longed for an out-of-doors view to relieve the monotony. I had read of women who had a map in front of their cook-tables and studied it as they worked. Think of it! It seemed to me that what I wanted to do was to punch a hole in the wall and see out-of-doors. One day I decided that I *would* have that hole punched there. And now I have a nice window, on a level with my eyes. In Winter I have in it a few pots of tulips, which, perhaps because of the steam, seem to thrive better there than in any other window. There are not enough plants, however, to obscure my view of a barnyard scene, a quiet pasture, and some beautiful hills beyond. Work in my kitchen is a more cheerful proposition to me now, nor is all my time spent in looking out of my window.

Cream Recipes for Cake and Icing.

In November usually the cheese factories in this section close, and until Spring opens the milk from the dairy is taken care of at the farmhouse. Then, morning and evening, the whirr of the separator is heard, and the housewife finds the abundance of thick sweet cream a valuable addition to the larder, for cream adds richness and delicacy of flavor to even the simplest dishes and without materially increasing the cost. In fact in many cases the resulting dish is more cheaply prepared, as the cream takes the place of butter, which costs more in proportion. Cakes made of sweet cream are very light, delicate and wholesome, and are easily and quickly made. The following is the simplest and is useful when eggs are scarce or very high.

No. 1.—One pint bowl of sweet cream, beaten until light and foamy; one pinch salt, one cup sugar, two teaspoonfuls baking powder sifted in two cups of flour. Flavor to taste. Beat together until smooth and bake in four layers in a quick oven.

No. 2.—One white of egg beaten in a pint bowl, fluffy but not stiff. Fill the bowl with sweet cream. Beat in one cup of sugar and a pinch of salt and two cups of flour sifted with two teaspoons baking powder. Flavor to taste. This also makes a four-layer cake.

No. 3.—Two whites of eggs beaten until light, but not stiff, in a large bowl. The right size to use holds 1½ pint. Fill the bowl up with sweet cream. Beat in one generously large cup of sugar and add a pinch of salt. Two cups of flour sifted with two large teaspoons of baking powder. Bake in four layers.

Cream Icing.—One cup of sugar, five tablespoons sweet cream. Boil until it makes a soft waxy ball when dropped in cold water. Stir until smooth and creamy and a little cool. Then spread quickly on the layers.

For chocolate icing add one tablespoonful of grated chocolate or one tablespoonful of cocoa before cooking. For cocoanut icing sprinkle shredded cocoanut over cake before it cools Walnut meats pressed into the plain white icing are very good.

It is a good plan to use the left-over yolks immediately in a salad dressing as it will keep a long time if canned while hot, and is then ready for immediate use at any time. The following recipe is a good one: One cupful of cream either sweet or sour, two egg yolks beaten, one cupful of vinegar, one-quarter teaspoon red pepper or less if desired. One tablespoonful of sugar, one teaspoonful of salt, one-quarter teaspoonful celery salt. Cook until thick and if not wanted for immediate use, seal in a glass can.

F. J. F. F.

Pickled Carrots and Carrot Pie.

We once lived in a Northwestern State where very few vegetables could be grown. Here I learned to use the carrot in many useful and tasty ways.

Pickled Carrots.—Scrape and clean carrots cut in halves or quarters, boil until done in salted water. Take out carefully and drain well in a warm place, as they are rather watery. Take two cups of vinegar, not too strong, and one cup of sugar, boil until quite a heavy syrup, then pour over the carrots. For flavoring I used to vary it by using ginger and mustard one time, and cloves and cinnamon another, always putting the spice in loose muslin bags, and letting it boil in the vinegar at least part of the time. If it sticks to the bottom it can be placed in the jar containing the carrots and the syrup turned over later. These are very nice.

Carrot Pie.—While on the ranch one of the boys remarked he would give a year of his life for a pumpkin pie on Thanksgiving, so I determined to find a substitute, for the real article was not to be had. I boiled carrots in salted water, drained them, and put them through the potato ricer. I used for each pie one cup sugar, one egg, salt, ginger and nutmeg, also one tablespoonful cornstarch dissolved in milk, and enough sweet milk to make it the consistency of the real article. I let it heat until nearly boiling and turned it into rich crust crimped like the usual pumpkin pie. They were a real success, and I never saw anyone who liked pumpkin pie who did not like them.

Carrot Croquettes.—Boil until tender young carrots, put through the ricer. Add salt, a beaten egg and about one-half cup of bread crumbs to two carrots, roll in beaten egg, then in bread crumbs and fry in hot lard. Let drain on brown paper.

Carrots with roast mutton are nearly as nice as sweet potatoes. About three-quarters of an hour before the roast is done, place scraped carrots cut in halves in the roaster about the meat. Let cook until done, then take up the roast on a platter, place the carrots around it. Make a gravy of the fat left in the pan by adding flour to the fat stirring smooth. Then add milk or water, and let boil, pour about the roast and serve.

MRS. JAMES LAMPMAN.

About 15 years ago my wife pickled some carrots. The idea was new to her as well as to myself, but the pickling was a success. The carrots remaining firm and crisp until used. Use small or medium sized carrots, pickle in brine sauce as cucumbers. Use vinegar liberally, put into jars, crocks or other containers. H. H.

Candy Fondant the Children Can Make.

There is one way of making an uncooked fondant which is as simple as can be, and the resulting candies are so like the real cooked fondant that to the uninitiated there seems no difference. The whole process is so simple that even children can make these creams. Separate the whites of three eggs and beat in powdered or confectioner's sugar with a fork. Do not beat the egg first. When stiff enough to knead, take it upon a board or marble slab. It can be made up immeadiately or packed away in a jar, the fondant being first wrapped in a damp cloth. This packing away for a time takes away any raw taste to the candies, but they are very good any time. The freshly made fondant needs only to be flavored and formed into shape, to make a delicious and wholesome sweet. Melted chocolate may be used to dip the balls of cream, cocoanut may be added to the fondant or sprinkled on the finished candy and raisins and nut meats pressed into the creams give a pleasing variety. There is another similar recipe using the whites of two eggs and an equal amount of cold water, into which the powdered sugar is first beaten with a fork and afterward kneaded.

Half the fun of having homemade candy is in the making. With these recipes there is no danger of the smaller children getting burned, and instead of their being in the way, they can be kept busy and happy helping make the creams. F.

KEEPING SWEET CIDER.—We found a very simple means of keeping cider sweet, some years ago. Grate horseradish and put in barrel when cider is sweet and put the bung in tight, after letting it work a very little. We liked it very much, as the flavor of horseradish gave it a little tang, which made it very nice, and still it was not sour or like hard cider. A. E. P.

BAKED APPLES.—Pare, core, and slice enough apples to fill earthen dish. Add a little water and cover with an old plate. Set in oven and bake two or more hours until well done. Remove cover and stir in a cup or more of sugar. Served with cream or without, you will find them delicious. I sometimes add a little peach juice or a few pieces of canned peaches for a change. They seem much fresher than when the sugar is baked with the apple, and there is no taste of burnt sugar, as is often the case, where they are not covered.

ALICE E. PINNEY.

WE are subject to all sorts of reverses, great and small. There is only one way of providing against depression and that is by acquiring a large outlook. It may come to some in the form of Christianity * * * to others in philosophy, to others in art, but it is always attainable if the searcher strives hard enough, according to his intellectual and moral temperament.—Lord Haldane.

Tubercular Germs

flourish in the most unexpected places and quickly attack a body weakened from colds or general debility, but if the lungs are fortified with SCOTT'S EMULSION their progress can be prevented and often overcome. *Scott's Emulsion* is used in tuberculosis camps because its highly concentrated nourishment builds strength and resistive-power faster than disease destroys. It assimilates without taxing digestion, and contains no alcohol.

Absolutely nothing equals Scott's Emulsion to strengthen the lungs and drive out colds and coughs.

GETTING STARTED WITH MUTTON SHEEP.

Two classes of men are making money from farm flocks of mutton sheep. One, the man who is gifted with the natural ability to select his breeding animals and look after every detail that will add to the welfare of his sheep—the other, the man with a determination and who persistently studies and labors until he acquires a working knowledge of the sheep business. Before investing in the sheep business a man should have a fixed idea of the shape and model of the animals he wishes to breed. The ideal always comes before the actual. The plan of the building is in the builder's mind, and drawn out on paper before the work is started. The man is always greater than any of his works; and he must have his plans clearly defined in his mind before he can work to any definite purpose. If a breeder does not have in his mind what an ideal animal is, he will secure it only by accident. How to study the breeds and get this ideal clearly in mind is a question I am going to illustrate by citing an incident that marked the beginning of a young breeder's success with Shropshires.

A few years ago, while making a circuit of the State fairs, I met a young man who was studying the various breeds of mutton sheep with an idea of buying a foundation flock. He had examined a large number of exhibits and failed to

REMOVING AN OVERCOAT. FIG. 9.

buy. First, he wanted to find out as much as possible about the various breeds of mutton sheep and he asked me if I would go about with him and tell him.

He was a wise young man. He did not know, and he knew that he did not know, and that is about half the battle when a man is buying foundation stock. It is the man who thinks he knows but still does not know who gets the worst of it. The large fair is a great place to study breeds and type. A man may see representative animals of the various breeds and types in their best estate. If he observes keenly he can note many points of excellence and utility that owners and supporters of each breed prize highly. He can compare the breeds and individuals at close range, which he cannot do by visiting the flocks in different localities. Comparison of breeds and types is of great assistance in enabling a man to form an ideal of the kind of stock he should breed. By seeing all the breeds together, it takes no very positive character to form an ideal and decide for himself which animals would do best in his own locality and on his own farm.

The breeders and exhibitors are a fine set of men to visit with. They are looking for business, and will tell you more about the breeds and types than you can learn from other sources in years. A man does not need to buy until he has made up his mind as to just the kind of stock he wants. Going the rounds of the various sheep pens and watching the work of the judges while placing the awards gives a man a liberal education. The prospective buyer remarked that Shropshires and Southdowns seem to take right well in New York. They are the aristocrats of the show yard and a right valuable all around sheep. Size up the rams, note their blocky, compact form, note the growth of wool. Here is a bunch of ewes that are about right, not as well conditioned perhaps as they might be, but all have brought good lambs, which accounts for their lack of flesh. They are fine shaped individuals and possess the ideal meat-making form. Such sheep ought to do well on your New York farm.

What about the Southdowns? None better, they are very beautiful sheep, have mutton quality to spare, but are a little small. They are a little short on wool in spots, but that is no great fault, and can be largely overcome by careful selection and breeding. Great sheep for their inches, early maturers and always fit to sell. Given the right feed and treatment they make excellent feeders. Go slow on feeding them too much corn, for it frequently injures their breeding qualities.

What do you think about Hampshires and Oxfords? They are fine sheep. Pretty black in the face, good size, perhaps if anything a trifle coarse and carry a little too much bone. Given plenty of feed and they will surprise a man, starve them and they are no good. Good sheep for the man who keep two or three dozen breeding ewes and gives them the most painstaking care; make great mutton when grown to maturity. Good feed the whole year through is what these big sheep need and must have. Not quite as well adapted to New York as to the corn belt. If you like them best there is little danger of going wrong with them.

How do you like those long wools? Long wools have merit along certain lines, produce good mutton lambs, but not so good as the Downs. Cotswold and Lincolns have never been very popular in the East; seem better suited to the range. Lots of them in the Far West and some valuable flocks in Canada.

Why did we go into breeding Dorsets? We got the flock cheap. If the ewes have many more sets of triplets we shall have to buy more land. Still these Dorsets have many good qualities. There is need to go a little careful with the ewes. They all have horns. That old buck would make a good battering ram; made the stable door look like it had been through a cyclone, killed a neighbor's trail hound and thrashed our bulldog. Ewes are great breeders and give lots of milk. They grow twins and triplets to beat the band. Excellent feeders, and make the best of mothers for Christmas lambs. There is great demand for these sheep in Eastern States where the hothouse lamb business is beginning to start up. They are easy to carry along with the swine and help to meet expenses on the circuit.

"Well now, honestly, which do you think is the best breed?" asked the young man who was looking for information. "There must be a best breed among them somewhere." No, there isn't. The best breed is the one you like best and think best suited to your farm and neighborhood. W. M. K.

A BREEDER'S EXPERIENCE.

Recently I saw the statement by a correspondent of THE R. N.-Y., that he could not afford to buy purebred females for dairy purposes, but that breeders would make him every inducement to buy a bull. Why is it the average farmer hates the word purebred? Everywhere the purebred sire, when given a chance, even on the most common animal shows his superiority, be it horse, cow, hog or perhaps only a dog. Many times I have sent meritorious sons of my best cows to the butcher, when all around me my neighbors were breeding their cows to common animals picked up at an auction. These calves could have been bought for a small advance above vealing value, but they would not have them. Right now I am buying calves for feeders from dairies using a common bull that only average 25 per cent of tops; a neighbor using a purebred bull gets top price every time.

One cannot pay too much for a sire if one can afford it; on the other hand the purebred sire, no matter how low in price, if a fit animal to breed from will improve any common herd. After the first purchase the next will be more easy. When I bought my first bull I had an option on two animals, one at $80 which I was using for his keep out of a nearby herd and one from a distance at $35. As money was scarce and both pedigrees looked good on paper, I bought the cheaper bull. From my bull I got nothing, and the other later, sired a 33-pound record cow, and in my herd he sired the best two-year-old I ever put a pail under, also the best grade cow in a dairy of 30 head.

My next venture was much as your correspondent describes. While at a breeder's buying two heifers he gave me the usual song about buying a bull. I said no, and continued to say no. He walked back in his barn and brought out a bull calf and threw it in the sleigh, then he said: "If you don't pay for it this year you will next." This bull proved a great breeder; his calves were large and straight, and nearly all heifers. His first daughter at two years made a record of 15.63 pounds fat in seven days, and every time I set a pail under one of them I thank the breeder for his persistency in making the sale.

I think your correspondent could deal with the small and obscure breeder to his advantage; many a good animal at a moderate price is overlooked in a desire to buy from the top-notchers. These same men are good judges of cattle; they pick up an animal here and there at a small price, take her home and give her a record, and her price goes up to five hundred or a thousand dollars, and her bull calves are in great demand as herd headers. If one is versed in breeding lines and a judge, or perhaps I should says knows what he wants, it pays to buy from the original owner. H.

New York.

MRS. KNICKER: "Do you have eggs for breakfast?" Mrs. Bocker: "No, but we have a phonograph record of a cackle."—New York Sun.

"DOES advertising pay? I lost a five-dollar bill on the street." "Well?" "I advertised, and so far I have received three five-dollar bills."—Pittsburgh Post.

A TREATISE on the Horse—FREE!

We offer free this book that tells you about many of the diseases afflicting horses and how to treat them. Call for it at your local druggist's or write us.

KENDALL'S SPAVIN CURE

is a safe and reliable remedy. It will cure Ringbone, Splint and other bony enlargements. It is also a reliable remedy for Curbs, Sprains, Bruises, Cuts and Lameness. It does the work safely at small expense.

Read what James M. Thompson, Fraser Mills, B. C., writes: "Would you kindly send me one of your horse books? I have a Veterinary book which I paid $5.00 for, but I believe I can get more satisfaction out of Kendall's Treatise on the Horse. I gave the book you sent me before to another barn boss."

And Mr. Wm. Booth, of Gravotte, Ark., writes: "Your book is worth $5.00 if only used as an aid in locating lameness. Shoulder lameness is the most difficult for an inexperienced man to locate. It is easy, however, with the help of your book."

Kendall's Spavin Cure is sold at the uniform price of $1.00 a bottle, or 6 bottles for $5.00. If you cannot get it or our free book at your local druggist, write us.

FREE-FARM ACCOUNT BOOK

KNOW HOW MUCH YOU MAKE THIS YEAR

No one shall pay a cent for Bickmore's Farm Account Book. Mr. Farmer, simply send us your name and address. Business farming puts money in the bank. This book is arranged to keep all accounts in simple form—more simple, and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborer's time record; and section for personal accounts. 64 pages; for ink or pencil. Not a cheap affair. Its quality is in keeping with

BICKMORE'S GALL CURE

A soothing, healing salve, the old-time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. Get full value out of yours. Bickmore's Gall Cure heals and cures Harness and Saddle Galls, Rope Burn, Cuts, Scratches, Grease Heel, etc. Keeps them sound and in condition for work. You don't have to lay the horse off. Bickmore's Gall Cure cures while the horse works. Great thing for sore teats in cows. Look out for substitutes and cheap imitations. Be sure to ask for Bickmore's Gall Cure at the store. The work-horse trade mark on every box. Farm Account Book is ready. Send today.

BICKMORE GALL CURE CO. Box 236 Old Town, Maine

POINTS FOR TAMWORTH SWINE.

Our reasons for preferring the Tamworth to other breeds of swine are as follows:

Under ordinary conditions it does not cost any more to produce a pound of meat on the Tamworth than it does on the fat breeds and under our conditions, it does not cost as much, and at the same time their meat is of a superior flavor, and has a much larger per cent of lean, their sides being streaked and their ham and shoulders largely lean, with a delightful admixture of fat. They are wonderfully strong and healthy and are blessed with a splendid appetite. They are very prolific, nearly always having litters of from eight to 12, and sometimes more, and usually raise all the pigs farrowed. They are better rustlers than any breed we know. They are able to make fairly good gains on large thin pastures, without grain, eating weeds and grasses on which, to say the least, the fat breeds would but maintain themselves. We do not believe there is any live stock that will pay better for the money invested than the Tamworth will, When given good clover pasturage, with a small allowance of Indian corn. As a pen hog, for those who keep but one or two for home consumption, the Tamworth has no peer. They are strong of vital organs, and are possessed of wonderful appetites, being ready at all times for the swill and other waste feeds, converting this feed into the best and most palatable of all meats. For years we have been growing, killing and curing large numbers of high grades and some purebred of this breed and we have always been able to sell their hams and sides at from three to five cents per pound higher than meats of other breeds on our local market. We now only keep purebreds, as the demand for them is growing.

North Carolina. D. J. LYBROOK.

RECORD OF 6 PURE BLOODS.

I see on page 1236 an article by G. A. Birdsall, Otsego Co., N. Y., in which he states that he wishes to step to the front and present the record of his herd of six grade Holstein cows from three to eight years old. I have six purebred Holsteins, five two-year-old heifers and one four years old. I give below the names, ages, and weight of milk.

	Milk
Aggie Alban Maid, 4 years....	14,515.6
Korndyke Ivy De Kol, 2 years..	11,970.2
Fairview Segis Malinda 2nd, 2 years	8,312.0
Aggie Alban Pontiac, 2 years..	9,368.7
Lady Butter Boy Pontiac, 2 years	9,258.0
Segis Korndyke Pontiac, 2 years	9,077.3
Total	62,501.8
Average for the six head.....	10,416.9

I cannot tell just what this milk brought as some of it went to a local milkman at five cents per quart, and some to the cream gatherer, skim-milk, being used at home for feeding calves and pigs. Figuring the milk at the average price received by Mr. Birdsall would make the milk average $168.96 per cow, in addition I have four very salable heifers, about one year old. There is plenty of room at the top; let us hear from others.

Connecticut. W. B. WHITLOCK.

WHY I KEEP JERSEYS.—There are so many reasons it would be impossible to answer all. The Jersey is a small, dainty animal, very beautiful to look at, and businesslike at the pail with her rich milk. Do you not think most people would rather have 20 quarts of rich milk than 40 quarts of milk from a cow without a high butter fat test? People argue that Jerseys are not good for anything after their usefulness at the pail is over, and that, for example, a Holstein cow brings a good price at the butcher's. My idea is, if you want a dairy cow get one, but a beef cow is a different animal altogether. I am not a believer in a dual-purpose cow; it is one thing or the other. I started with one cow a couple of years ago, and now have 15, besides each year selling young stock. I have only bought four cows and one young bull, raising all the rest of my herd. I have been very careful of the blood that runs through the veins of my cows. That is why I go slow but sure. My older bull is St. Lambert, a great-great-grandson of Ida and Bachelor of St. Lambert, and a grandson of Matilda's fourth son, and the other is a grandson of the imported Eminent. My cows are all descendants of Pedro, and in their veins runs the blood of Alphea, Europa, Eurotas, Brown Bessie, and others equally as well known. I do not exhibit, believing that it is too exciting, and I run too great a risk with disease. Never having consumption or abortion in my herd, I do not choose to risk it in the show ring. I can sell my stock on their pedigree, and that is best, for blood will tell in the animal kingdom as well as in the human family. Great care is exercised in bringing the young stock to perfection, and I never allow my matrons to milk up to their time of calving, always drying them up for two months; then I obtain good strong calves and their mother is in good condition. I have my young stock come in the Spring and early Summer, so that they can have the good sunshine and the green grass.

I believe in the tuberculin test, but I do not believe in letting any "Tom, Dick or Harry" use it—only a graduate veterinarian, and be sure he knows his business. I can approach my cows at any time. Kindliness and gentleness to dairy cows has a direct money value to one; besides, if in case of fire or accident, one can easily handle and calm them. Teach them to come at the call of their names; it can be done with no trouble. It is the little things that count.

Orange Co., N. Y. R. F. NICHOLSON.

LIVE STOCK AND DAIRY PRICES.

Cows, $60 to $90; butter, 27; eggs, 40; chickens, 10; turkeys, 16½; apples scarce, 50 cents per peck; potatoes, 75; corn, 70; hay, $15 per ton; straw, $7 to $8; hogs, $7 per 100 pounds. R. F. M.

Claysville, Pa.

We get these prices in Washington, D. C., after a wagon haul of 20 miles: Hay $18; new corn $3.25 per bushel; potatoes 50 to 60 cents per bushel. Milk 20 cents per gallon; cream 80 to $1 per gallon; apples $2 to $4 per barrel; wheat 88 cents at local mill. W. J. T.

Ednor, Md.

Cattle, live weight, eight cents; cows, $50 to $90; hogs, live, eight cents; dressed, 10; pigs, six weeks old, $5 to $7; horses, $100 to $250; apples, good, 80; potatoes, 60; wheat, $1; rye, 80; oats, 45; corn, 85; buckwheat, 75; butter, 28; eggs, 32; chickens, live weight, 12; lard, 13; milk, five cents per quart.

Clearville, Pa. I. K.

Our main products, except milk, are marketed at Utica, and as we are 12 miles from Utica, no garden truck is raised, and our main dependence is market milk, which Borden's, from Waterville, get at their contract price, with additions as earned. Potatoes are our main money crop, and are bringing to the consumer in Utica $1.10 per bushel, and from the stores 90 cents to $1 at Utica. Fruit is a failure in this section this season. Grade Holstein cows, springers, $65 to $100, depending on color, size and markings. A pea viner at Paris Hill gives a chance to those who wish to raise peas to be delivered there at their contract price, which is $2.50 per hundred weight for early peas and $2.50 per hundred weight for late peas. Timothy hay, $18 to $19 per ton loose at Utica, and $14 to $15 to dealers at barn, dealer to bale, and farmer to deliver to nearest freight depot.

Cassville, N. Y. P. S. D.

The Henyard.

Selecting Hens as Breeders.

The enclosed clipping is from an advertisement in a western poultry paper. Will you give us the facts concerning these trap-nest results at the Maine Station?

"The Maine Experiment Station trap-nested hens for years and bred from the best layers and the roosters that came from the best layers, and finally arrived at the conclusion that it was impossible to build up with any certainty a flock of heavy layers. That was because some people, some animals and some birds are able to transmit to their progeny their predominating characteristics and some are not, and the managers of the Experiment Station did not know how to pick out the prepotent birds. So, when they had, with the trap-nest, ascertained the best layers, they did not know how to mate so as to produce more good layers, and further progress was a matter of mere chance."

Concerning the feeding of milk. Mr. Cosgrove stated some time ago that Tom Barron "always fed his milk as sweet as possible." I think some have often said "Feed only sour milk." Perhaps you can give us some discussion on this subject. W. H. M.

Orland, Cal.

The facts are about as stated in the clipping referred to by W. H. M. But that does not contain all there is to that subject. Prof. Gowell, who began the practice of breeding from only high-producing hens and their sons, at the Maine Station several years ago, and whose experiments did not result in building up a strain of heavy laying birds as he expected, probably was not aware of one fact that has been pretty conclusively demonstrated by further experiment; viz. that the high producing hen does not necessarily transmit that quality to her daughters, in fact does not usually do so. By extended records of the performance of the daughters of high-producing hens, it was found that there were fewer 200-egg pullets produced by them than by fairly good layers, say 160-egg hens. These experiments were carried on for years after Prof. Gowell's death, until it was pretty conclusively demonstrated that the 200-egg hen transmits her laying qualities through her sons, rather than through her daughters; and to raise good pullets it was better to use fairly good laying hens mated with males from high-producing dams. Prof. Gowell doubtless thought that as Jersey cows had increased production by mating high producers with sires from high producers, the same result would follow from mating hens likewise. But there is an essential difference. The hen has to put life into every egg; part of her vitality is gone with every egg laid, while milk is a manufactured article; if the Jersey cow had to produce 10 or a dozen calves in a year, her vitality would be depleted, as is that of the high-producing hen.

In regard to feeding milk, Mr. Barron did say that he feeds his milk while sweet, and in that condition there is no doubt that it is a very valuable food. But when fed sour, milk has another value as well; that of producing conditions in the intestines of the chick that are unfavorable to the multiplication of certain harmful bacteria; notably the bacteria that produce black-head in turkeys, and white diarrhœa in chicks, and I do not know that milk loses any of its food value by becoming soured. I mean by "soured" what is variously called "lopped milk," "bonnie clabber," "schmearcase," etc. All utensils in which it is fed should be boiled and thoroughly cleaned frequently. At Storrs last Spring 100 chicks just hatched in an incubator, were divided into two lots of 50 each, and put in adjoining yards. Both lots were fed and cared for exactly alike except that one lot had sour milk every day, the other did not. I saw them when they were six to eight weeks old. No one would hesitate to give twice as much for the lot fed sour milk, as he would for the other lot. The sour milk fed chicks were at least one half larger than the others, were better feathered out, more even in size, and only one had died; while six or seven of the other lot had "gone to fertilize the earth."

No man knows it all, Mr. Barron realizes that he has something to learn from American breeders; as we have much to learn from him. And the longer a man is in the business, the humbler he becomes because he realizes more and more what a lot there is that he doesn't know.

GEO. A. COSGROVE.

Criticizing a Henhouse.

On page 1312 Harry R. Lewis in "An Efficient and Economical Poultry House" states: "It should be high enough to give ample head room when caring for the birds, and should admit sunlight in the front openings, so that at some time during the day they (it) will shine on the floor clear to the back of the pen." He further states that the sized unit found to be the most efficient and economical is a room 20 by 20 feet with nine-foot studding in front. Figure 515 shows windows five feet high placed midway between the plate and sill, making the top of the window only seven feet above the floor. Under such conditions sunlight will reach back only about 16 feet, and that distance only on December 21. To have the sun light reach clear to the back part of the pen it would be necessary to have the window placed clear up to the plate. In the building described the rear four feet of the floor will never be reached by the sun, neither through the windows nor the muslin curtain openings.

Theoretically the square pen is the most "efficient and economical," but the practical poultryman will find it rather cheaper and more satisfactory to build a single span or shed-roof" henhouse from 14 to 16 feet wide. With a building of the latter width it will be possible to have the sunlight reach clear back to the rear of the pen not only on December 21, but for nearly a month. Besides, he can do away with the middle supports for the rafters, and the posts running through the center of the pens.

The eight-inch concrete wall is much thicker than necessary for a building of this size. Such a wall will easily support a dwelling-house or a good-sized barn. While the extra thickness does no harm it adds 33 1-3 per cent to the cost of the foundation, and as the average poultryman has no State funds with which to put up his poultry buildings, it is simply good business to build amply strong and put the extra money in better poultry, or, perhaps, give it to the "missus" for kitchen conveniences. The diagram shows a door in the east end. I like to make the ends and back as tight as possible, thus cutting off any possibility of drafts. J. D. PRICKETT.

Ohio.

Concrete Poultry House Floor.

On page 1312 appears an article on poultry house construction which I cannot let pass without entering a decided criticism. The article referred to gives the plan of a poultry house which conforms very closely to those used throughout the country on the larger farms, and is without question the best that can be designed with one exception, the concrete floor. The writer of the article, Mr. H. R. Lewis, doubtless knows that many of his readers are going to adopt his house without question, and this is where the harm creeps in. They think any plan emanating from an experiment station *must* be all right, and from lack of experience and opportunity to see other houses go ahead and build. The article does not tell the important fact that a concrete floor, while being theoretically correct as far as keeping out rats and moisture is concerned, must be covered with two or three inches of sand or soft loam, and that this must be renewed twice or three times a year, and that without it you might as well hold your hen's toes to a grindstone, so quickly will it cut them down to the flesh. Then supposing the sand is used to prevent this trouble, anyone who has ever tried to fill a small hollow in his lawn with two wheelbarrow loads of dirt and found that it took six wagon loads instead, knows what the labor would be, and the result is that it gets done the first time when the house is new and the busy farmer says "never again," leaving all the filth to collect or else grinding the hens' toes off. I have seen many farms where concrete floors were used, and the results were exactly as set forth, so that, while believing concrete to be the best, I will never recommend another, but will take the dilemma by the horns and advise a double-boarded floor with six inches of suitable litter. IRVING C. LEWIS.

Pennsylvania.

Reply by Prof. H. R. Lewis.

This correspondent virtually agrees that the concrete floor was the best for moisture prevention and the keeping out of rats. In regard to the birds grinding their toes off, and in regard to the using of sand on the floor, will say that we have used concrete not only on this plant, but coöperatively with over 100 of the leading poultrymen in the State, and we have never seen the results described. We never put sand over the concrete floor, but keep it covered with a good scratching litter to a depth of from eight to 12 inches, and it is not long before this litter is broken up so that there is plenty of fine material next to the floor. From the sanitary standpoint, it is absolutely necessary to clean any poultry house, at least, twice a year. Where the floor is dirt, it is necessary to take out not only the litter, but also from six to eight inches of the top soil, and replace with clean soil; whereas in the case of concrete the poultryman can, with a shovel, hoe or broom, clean the house very quickly and completely, and then by using a good disinfectant the house is absolutely clean, and he can accomplish this with the least amount of labor and the greatest assurance of success. Mr. Lewis advises a board floor, and uses the same treatment in reference to litter as we do with our concrete floors. NEW JERSEY EXP. STATION.

Wyandottes and White Eggs.

I notice on page 1289 the note about White Wyandottes laying white shelled eggs. This does not appear to me so difficult as Mr. Cosgrove's article might indicate. I have bred White Wyandottes for seven years, and without trying to influence the color of the eggs by selecting as breeders only those females which laid white eggs, I notice from year to year that my White Wyandottes are laying whiter eggs and more of them. I have in the same breeding house four pens of Leghorns, and all eggs are collected together, and it is impossible to tell the white White Wyandotte eggs from those of the Leghorns. Of course I get some colored Wyandotte eggs, but these are mostly pinkish white. I breed as well Brahmas, Rocks and Reds, all of which lay brown and dark brown eggs, but my Wyandottes lay nothing near as dark as the above mentioned breeds. This year's pullets seem to be laying 50% clear white shells and the other 50% is a light pink color. I have done nothing to make this so, as my business is eggs for hatching and show birds, and I don't care what the color of the eggs is. From my experience, however, I feel confident that I could produce a strain of white-shelled White Wyandotte egg layers in a short time. F. M. PRESCOTT.

New Jersey.

Large White-Egg Fowls.

Would you tell me the name of the largest breed of chickens that lays white eggs suitable for the New York market? The White Wyandottes would suit me very well if they laid white eggs.

C. B. C.

There are no breeds comparable with the Wyandottes in size which lay white eggs, and you will be compelled to make a choice between color of eggs and size of fowls. The S. C. Black Minorcas are the largest of the white egg laying breeds, and they have no superiors when in comes to size and beauty of their product. As a breed, however, they do not lay as many eggs as the Leghorns, and unless in some special market, their eggs do not bring a premium. They cannot compete, therefore, with Leghorns upon commercial egg farms, but when size and beauty of the fowls and their product are the chief considerations, the Black Minorcas cannot be excelled.

Rheumatism in Fowls.

One of my R. I. Red pullets, which was just about ready to begin laying, showed lameness in her right leg, being unable to use same from the knee down. I thought perhaps she had hurt her foot, but a close examination seemed to show it was all right. Three or four days later the left foot or leg was similarly affected. The hen was isolated and from information at hand can only imagine it is what is called "leg weakness." She seems perfectly healthy and normal in all respects and eats well, but shows no improvement to treatment, i. e., I have taken away all corn, only feeding oats and wheat and some oatmeal, bathing her legs occasionally with arnica. I hope you can advise me. W. R. H.

New York.

Rheumatism is one of the most frequent causes of lameness, and final inability to stand, in fowls, and is quite likely the cause of the trouble which you describe. If the quarters which your fowls occupy are damp or expose their occupants to wind and drafts while on the perches, you should correct these conditions, and if you wish to treat this hen individually, you may remove her to warm dry quarters where she can be fed by herself. Give her soft food of which wheat bran forms a considerable proportion, plenty of green stuff, and skim-milk if you have it, and do not feed meat of any kind. As medicine, give three or four grains of sodium salicylate twice daily, dissolved in as much water as you can administer. For convenience, the drug may be obtained in tablet form, but it is irritating if given undissolved in water. M. B. D.

GRUMPY STRAPHANGER (loudly): "I wish you'd move those confounded valises out of th' aisle." Indignant Sitter: "Those aint valises—those are my feet." Grumpy Straphanger (more cheerfully): "Well, you might at least pile one on top o' t'other."—Cleveland Plain Dealer.

SMYTHE: "I dropped a penny in front of a blind beggar today to see if he'd pick it up." Tompkins: "Well, did he?" Smythe: "No; he said, 'Make it sixpence, mister, and I'll forget myself.'"—Tit-Bits.

A ROUND BARN.

Last year we had a picture of the round barn which Mr. J. L. Dean, of Maine was building. Now we print a picture of the completed barn at Fig. 5. This building is 64 feet in diameter. The silo is at the center, and there are 37 stalls. There are a good many of these round barns scattered through the country. They are usually pronounced satisfactory by their owners, since they economize space; yet, somehow, with all the arguments in their favor they are usually a novelty, as the great majority of farmers prefer the square corners.

GRADE OR PUREBRED IN DAIRYING.

There are at least four legitimate objects to be had in view when purebred stock is introduced into the flock or herd. These are briefly: To increase the production. To improve the quality of the product. To secure uniformity in the product. To gratify the eye by pleasing color and symmetry of outline. Many farmers will say that they cannot afford to consider the fourth point, but it should be remembered that many wealthy buyers of purebred stock are as much influenced by the beauty as by the utility of the breeds or individuals which they select. It is a well-known fact also that beauty will add to the selling price of any good animal at the average farm auction sale. If a man is producing beef from a herd of native, mongrel, or low-grade cattle, the introduction of a good purebred bull of pronounced beef type will accomplish all four of these ends. In this case the product is the living animal as it goes to market, and uniformity in size, formation, quality and finish will add materially to the value of a carload of fat cattle. As this condition can be better secured in a herd of purebreds than in any herd of grades, it follows that the purebred has a positive, practical value above the grade for beef purposes, and it is probable that a very large part of our beef, pork and mutton will finally come from purebred herds.

The situation with reference to the dairy herd is, however, entirely different. The products of the various animals are not marketed separately, but are blended into a single article—a can of milk or cream, or a tub of butter, as the case may be. The individuality of the various units of the herd is wholly lost, and the purchaser of the goods has no concern whatever as to the variations in size, form, age, or color of the cows producing them. For these reasons we cannot urge the practical dairyman to invest in a registered herd with the same assurance that we feel when presenting the case to a beef raiser. The dairyman can look to an infusion of better blood to increase the milk or butter yield of his herd, and, within certain limits, to improve the quality of either or both. But the dairy cow, when past her usefulness in the herd, has a rather low beef value at best, and a registered Holstein or Jersey, full of years and honor, is worth no more at the block than her half sister which is a grade. In fact the annual average cash profit per cow will be practically the same from two herds yielding like quantities of milk or butter if one be a registered and the other a grade herd. The difference will lie wholly in the selling value of the calves, and this is a matter of geographical location to a very large extent. Furthermore many dairymen who sell milk are anxious to rid themselves of the calves as soon as possible, and do not combine dairying and stock-raising very successfully. If these men keep bull calves beyond the age at which they can be sold for veal, it is questionable whether they will ever dispose of them at a profit, no matter what their breeding may be.

What, then, is the sensible policy for the farmer who is largely dependent upon his dairy herd, and who owns chiefly native or low-grade cows? My suggestions are not at all radical. He may have some cows which do not yield him a dollar of profit in a season, and yet his situation may be like that of my neighbor who justified the purchase of a rather unpromising cow at a local auction by saying: "My contract calls for so many gallons of milk per week this Winter, and if I can't get it out of good cows I've got to get it out of poor ones." I do not approve the policy of attempting to do so much on a farm that part of it must be done at a loss, and am sure that any man can afford to take time and trouble to weigh the milk of each cow often enough to know which are being kept for nothing. If the Babcock test cannot be readily applied it is quite possible to set samples of the milk of each cow, and by comparing the cream yields arrive at some approximately correct conclusions as to the relative desirability of the members of the herd.

When unprofitable cows are located they should, of course, be disposed of as soon as they can be brought to marketable condition, or as soon as better ones can be found to take their places. But if careful tests show that the herd is composed of a fairly uniform lot of very moderate producers, giving only half the net income per cow that modern dairy teachers tell us we should obtain, I would be the last to urge the owner to sell his entire herd and invest the money in registered stock, putting in perhaps eight cows in place of 24 sold, and expecting to make three times the profit per cow that was formerly secured. The average small farmer cannot afford the risk involved in making such a change, for the death or injury of one cow would then mean the loss of too large a part of his working capital. The only logical course for this man is to secure at once a good registered bull or bull calf of the breed best suited to his needs and raise as many heifers per year as possible, meanwhile losing no opportunity to replace a poor cow with a better one. Not all bulls of the same breed have equal values as sires of dairy cows, but it is an exceptionally poor one which does not earn many times his cost when used in a grade herd.

Virginia. W. A. S.

A GENTLEMAN who had been spending a holiday at a Scottish seaside village noted for its golf links asked one of the caddies if he got much carrying in the Winter time. "Nae, sir, nae," replied the caddie. "There's nae carrying in the Winter time. Ye see, it's this way. If it's no sna' it's frost; if it's no frost it's sna'; if it's neither sna' nor frost, it's rain; if it's no rain, it's wind; an' if it's a fine day, it's the Sawbath!"—Tit-Bits.

A FOUR-year-old Harlem miss, whose homeliness is as pronounced as her lovableness, has long resented the practice of her parents and others of spelling words that they didn't want her to hear. Recently a relative who hadn't seen the child arrived for a short visit. In talking with the mother the next day in the little girl's presence she said: "Isn't it too bad she is so u-g-l-y?" "I may be u-g-l-y, auntie, but I'm s-m-a-r-t."—New York Tribune.

OUR SECOND CONSIGNMENT SALE

SYRACUSE, N. Y., JANUARY 27-28, 1914

190 -- HEAD -- 190

A SON OF KING OF THE PONTIACS

His dam a 31-lb. cow—A son of Sir Johanna Colantha Gladi, his dam is a 31-lb. daughter of Rag Apple Korndyke, his grandam is Pontiac Gladi, with 32.01-lb.—A bull calf whose three nearest dams average over 30-lb.—A son of Rag Apple Korndyke 8th—A son of King Pontiac Artis Canada, he is a son of King of the Pontiacs and Pontiac Artis (31-lb.)

THREE DAUGHTERS OF PONTIAC KORNDYKE

One a 21-lb. 4-year old bred to the 44-lb. bull—One from a 29-lb. dam—a daughter of Rag Apple Korndyke from a 20-lb. daughter of King of the Pontiacs—A daughter of Dutchess Ormsby Butter King bred to a son of the 44-lb. cow—Daughter of Sir Rag Apple Korndyke. More cows bred to 30-lb. bulls in this sale than ever entered in any other.

NO SALE WILL EQUAL THIS ONE IN THE QUALITY OF ITS OFFERINGS

The consignments are all in and the breeding of most all is superior to anything yet offered in any sale this year.

I'll Stop Your Losses
From Worms - I'll Prove it or No Pay

If you will fill out the coupon below—tell me how many head of stock you have, I'll ship you enough **Sal-Vet** to last all your stock 60 days, without asking a single penny of pay in advance. All I ask is the privilege of proving to you right in your own barnyard what I have proved to thousands of other farmers. I want to show you how to rid your stock of worms—how to make all your farm animals grow faster, thrive better, keep healthier, put on more flesh on no more feed—**make you more money.**

The Great WORM Destroyer

TRADE MARK **SAL-VET** REG. U.S. PAT. OFF.

The Great LIVE STOCK Conditioner

is a wonderful medicated salt which rids farm animals of their greatest enemies—the deadly stomach and intestinal worms. It kills and expels these blood-sucking, life-sapping parasites and greatly lessens the danger from hog cholera and many other diseases.

I'll Feed Your Stock 60 Days Before You Pay

Send no money—just tear off the coupon below, mark down the number of hogs, sheep, horses and cattle and mules you own, give your name and address and shipping station and I'll send you enough Sal-Vet to last all your stock 60 days. You simply pay the moderate freight charge when it arrives and at the end of 60 days report results. If it don't do what I claim—if it fails to rid your stock of the dangerous stomach and intestinal worms I'll cancel the charge—you won't owe me a penny.

WHY WE KEEP HOLSTEINS.

We keep Holsteins because we love the "black and whites." We love our friends because they help us in the dark moments of life, we love and keep the Holsteins because they help and keep us all the time and respond nobly to kind treatment; in other words, I believe them to be the most docile breed of cattle in existence, and nervousness is not conducive to large production. To be sure the Holsteins are not high testers in butterfat, but quantity offsets quality twice over in many cases, thus having the advantage over the other breeds in either milk or butter production. For instance, our herd averaged officially, including two, three, and four-year-old heifers, 430.2 pounds milk each in seven days, or 61.4 pounds per day, and 15.74 ponnds butterfat, or 18.5 pounds of good commercial butter per week. If I have a market for milk I shall sell milk, as I certainly have it in large and generous quantities; if the market changes so that butter is the highest-priced dairy product, I won't swap, sell or give away my Holsteins, but go right on making butter from them, for I surely would travel considerably to find a breed that will average better than 18.5 pounds butter per week, including cows and heifers of all ages, and this is by no means better than the average purebred Holstein breed.

The Holstein is naturally a large cow with a large capacity, therefore not so susceptible to indigestion and other ailments of like nature due to inexperienced feeding as most of the other breeds, this certainly should be considered unless the owner is experienced and can be on the job personally. Another point to be considered is the final disposition. If I allowed my sentiments to get the better of me I think I would pension that large, whole-hearted, gentle and patient beast that helped pay off the mortgage, by letting her end her days in a nice green pasture, but I don't think our Creator requires this of us, so I will put some fat on her and she, as though with a parting sign of gratitude, will tip the scales at 1,200 pounds and drop into my pocket her last generous offering to my welfare.

Holsteins are such large wholesome cattle that they are also less susceptible to disease, and invariably if properly cared for before parturition will give birth to a large healthy calf, which also is practically immune from the usual calf disorders.

I might mention in favor of the "black and whites" that doctors have discovered the rapid digestibility of Holstein milk, and are recommending its use in the sick room for infants and invalids. Spurgeon said he would not be surprised to see the horse in heaven, and I am sure that had he been associated with cattle as long as I he would certainly have included the Holstein cow in his vision of eternal bliss.

Madison Co., N. Y. S. B. JACKSON.

OHIO HOLSTEIN BREEDERS MEET.

The Western Reserve Holstein Breeders' Association met at Burton, Ohio, December 12, 1913. Although the roads were bad, a good crowd was in attendance. They were called to order by Pres. Paul McNish. Discussion followed on prizes to be awarded to boy raising best Holstein calf to be exhibited at county fair, 1914, by the Association. Prof. Erf of Columbus, Ohio, who has the official test work in charge, was the speaker. He has at present 52 testers working under his direction in Ohio now. He said that the Association at Burton was doing more for the advancement of the Holstein than any other association of its kind in the United States. It is well known that the first great record was made by Holsteins, although the professor is a friend of the other breeds of cattle too. He also explained why butterfat is used in official tests rather than butter, as it is well known that a certain per cent of water may remain in butter especially in Winter, so that a cow making 1,000 pounds of butterfat could easily make 2,000 pounds of butter, varying of course with the maker. Hence butterfat is the only way to make an accurate test. The construction of registry work, and purpose of it, is to get as nearly as possible an accurate test. It has been necessary for those making great records of several months' duration to have seven or eight testers, during the work, some coming from out of the State. While this is expensive it is the only way to convince the public that these great records have been honestly made.

Prof. Erf does not advise the inexperienced breeder to inbreed too closely, but rather follow line breeding, going back five or six generations, as is possible in a community like this. He said breeding Holsteins and Jerseys nearly always gave the Jersey quantity and Holstein quality. He believes if the work of testing is carried out according to present indications in 15 years this will be the greatest Holstein center in the world. We have now three cows whose official records are over 1,000 pounds of butterfat in one year. He said that 90% of our great producers would stand a poor show in the show ring, and that a wise man purchased cows with official records rather than show ring prizes, and tested these cows before selling, to avoid selling a $3,000 cow for $200. J. L.

TALKS ABOUT COWS.

I worked on my father's farm until 21 years old, and then spent five years in Illinois working on farms in the Summer and going to school in Winter; teaching one Winter. Then I married and settled down on a 26-acre farm in Pennsylvania. Besides farming this piece of land I worked during the forenoon for a creamery company, firing the boiler, running the separator while the milk was coming in, and testing the milk. While doing this I was producing milk on my farm also bred and raised a few cows. I bought one cow that was half Short-horn and half Jersey from registered stock on both sides. This cow was of good shape, highly nervous and a good producer. I bred this cow to a Polled Angus bull and raised a heifer that proved a good performer. The seventh week after freshening the third time she averaged 49 pounds per day with a test of 3.8 butterfat. Could I have sold this milk at eight or nine cents per quart I could have figured some profit; but as I was selling the butter and getting 80 pounds skim-milk back per 100 delivered I was compelled to figure on the skim-milk and console myself that the manure was worth something, in order to find a profit. I was compelled to make public sale last March at which time I sold this cow for $90, her yearling heifer $45, and her calf eight weeks old $21.25. Now most farmers are up against the same market for their milk products, the butter market. For 14 years I have had the inside information as to the returns of those who have attended our creamery. Many of them have kept their herds supplied by buying cows at the cow venders' sales. These cows are the discards of other farmers, sometimes advertised as coming from another county or State. In fact they almost have to be shod to keep their feet from getting sore, driving from one sale to the other. Just how these farmers figure a profit I don't know. I do know that when the creamery man pays them off at three pounds per 100 they call him all kinds of names. There are other farmers who have been with us all these years who have seemed satisfied; perhaps not because they figured to find a profit, but because they always received a good test. They have made no pretense to raise purebred stock, but they have raised all their own stock from their best cows.

Pennsylvania. J. H. B.

Garget.

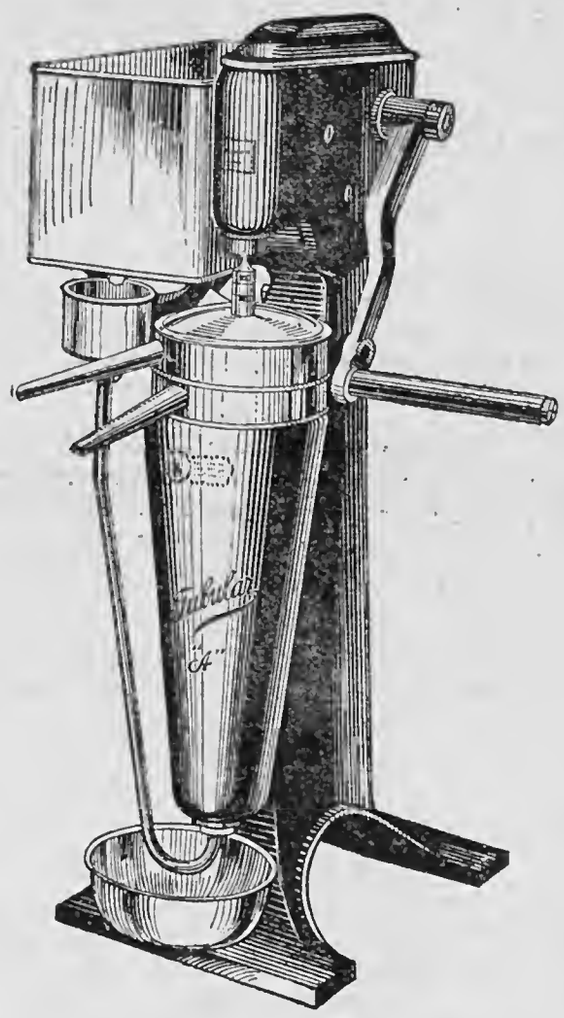
I have a very fine Jersey cow, six years old; who came in with her third calf about three weeks ago. The two left teats were hard, and the discharge was watery and yellow. The right hind teat gave and is still giving three quarts of milk in the morning and about two quarts in the evening, while the front teat gives but little milk (about a pint a day). From the time of calving I first poulticed udder and washed it three times a day with hot water, and put sweet oil all over it. The hardness has totally disappeared and the little milk that is flowing is all right. I allow the calf to suck enough to keep it in good condition. Is there any chance whatever, that those three teats will come back? B. K.

Long Island.

If the three teats give normal milk there is likelihood that full milk flow may return at next calving; but there is little prospect of a full milk flow this time. Is should be remembered too that there is great danger of the attack coming on again at the slightest provocation, and for that reason we do not consider such cows profitable to retain for dairying. A. S. A.

THE SHEPHERD DOG.—I would be glad to hear from you regarding the old Shepherd dog and why he has been replaced by the Collie among the farmers. Personlaly I do not think the Collie fills the place of the shepherd at all, and yet the shepherd is almost if not quite extinct in this section of the country. I would be very glad to have the opinion of other farmers on this subject.

Union Pier, Mich. H. W. G.



SHARPLES
TUBULAR
CREAM SEPARATOR

The possession of the world's best is none too good for you farmers and dairymen who steadfastly strive to anticipate the trend of progress. Knowing this, we ask you to bear in mind the fact that in purchasing a SHARPLES TUBULAR CREAM SEPARATOR you are investing in a lifetime of service and increased revenue.

Every separator made by us has fulfilled all the requirements of durability, labor-and-money-saving, and has increased the production of butter-fat from each cow. It has met the demands of the most critical and exacting users.

Because we believe in its supremacy, we attach to each machine the name SHARPLES—our method of inspiring confidence.

SHARPLES
MILKER

The SHARPLES MILKER has made the dreams of dairymen realities. Its efficiency is demonstrated by the twice-a-day adjustment of the soothing teat cup with the upward squeeze to the teats of 100,000 appreciative cows.

A CHICKEN MAN'S ARITHEMTIC.

"And why White Leghorns?"

That was the question I put to the chicken man, after looking over his plant, and as we were leaning against the side of the largest and latest of his half dozen henhouses, the one which was evolved out of his 10 or 12 years' experience in the chicken business, one which embodied the idea of a 600-hen unit, and was self-contained—that is, it had water in the house, a feed room, and arranged so that the brooding for the house was provided for, and that when the hens were to be replaced by pullets the change was easy and simple.

We old farmers tried to keep to general farming, though the country was ill-adapted to field crops; a light, sandy soil made fruit, early vegetables and poultry much better suited to the region, besides a good market easy to reach.

The chicken man was not a farmer-born, but was city bred, and until he was 20 years of age had never been outside of the city, except to meet a baseball or football team in some country town. About 10 years ago he came to the neighborhood and proceeded to develop a poultry farm out of a hundred acres of stump and second-growth timber land. He had never shirked work, took advice when it seemed reasonable, was perfectly square and honest, and had developed a good business by work and attention to details with very little money, so that now his net income was one of the largest, if not the largest, in the whole neighborhood.

As to the Leghorns, he answered: "Because, as eggs are the chief source of profit in the poultry business in this region, I keep the hen that will give me the largest return on the investment."

This was an answer, but hardly a satisfactory explanation, so I said:

"Do White Leghorn hens lay more eggs than those of any other breed? Say, as do my wife's Plymouth Rocks? It seems I have seen it stated in all the poultry papers that there is practically no difference in the number of eggs laid by the different breeds in a year; that all the college contests show about the same number of eggs, from the Plymouth Rock, or the Wyandotte, or the Rhode Island Red, or the Orpington hen, and so on?"

He smiled and said: "Let me illustrate by an analogy and by a comparison: As a dairyman, when you make up your ration for your cows, there are at least two factors you consider—the weight of the cow, and how much milk she is giving. The weight is a fixed factor; for example, if you had five cows that weighed 6,000 pounds you would feed them about the same as if you had 10 cows that weighed 6,000 pounds, and your milk would likely be about the same. The feed and the receipts would both depend on the weight of cows you kept, not on the number; and to raise 6,000 pounds of mature cows would also depend on the weight and not on the number. Applying this analogy to chickens, while we make a comparison, to raise 6,000 pounds of chickens of the White Leghorn breed, at four pounds to the hen, there would be 1,500 hens. The Plymouth Rocks, Rhode Island Red, or Orpingtons would weigh, say 7½ pounds, and we would have 800 laying hens. The by-product in both cases would be almost the same.

"In White Leghorns this would be: 1,500 broilers, 1½ pounds each, 2,250 pounds; 1,500 two-year-old hens, four pounds each, 6,000 pounds. In the Plymouth Rocks, Rhode Island Reds, Orpingtons, etc., that would be: 800 broilers, at 2½ pounds each, 2,000 pounds; 800 two-year-old hens, 7½ pounds each, 6,000 pounds. If there was any difference it would be slightly in favor of the White Leghorns, as on the open market the price is the same per pound.

"In egg production, however, the showing would be overwhelmingly in favor of the White Leghorn. Say for the year the hens would average 12 dozen eggs each, a rather high average, I admit, though very conservative when you read the "200-egg hen" literature, that you would have 1,500 White Leghorns, at 12 dozen each, 500 cases; 800 heavy breeds, at 12 dozen each, 270 cases; in favor of 6,000 pounds White Leghorns, 230 cases. That is the reason why I confine myself entirely to White Leghorns. If my specialty were broilers or soft roasters, or capons, the argument might take on quite a different phase. As to the fancier, he is an artist in a class by himself; and it is well that he chooses the breed that appeals to him for other than commercial reasons, and most of the reasons given for the different breeds are not commercial reasons.

"Don't understand me that you can produce 500 cases of eggs with White Leghorn hens for the same food that you can produce 270 cases with the heavy breeds, but the machine that gives you 500 cases will take only a little more than the one that gives you 270 cases a year. Some years ago, in a little experiment one Spring, I found that the food consumed by 100 White Wyandotte hens would well feed 160 White Leghorns, and this experiment was made during the egg season. The percentage of eggs was about the same in both flocks, so I found that the food went to egg production in a much larger proportion in the one case than in the other. The White Leghorn broiler is a great favorite among my customers; so is the small compact two-year-old hen; so the by-product is very easy to dispose of. I might add housing, foraging and freedom from broodiness, but the reasons are obvious to one who is in the egg business." D. H. C.

Michigan.

Mating Breeding Pens.

My problem is how to mate up breeding pens of 50 hens and four cockerels. I know that many of your readers run several cockerels together successfully but so far I have not been able to prevent their fighting even when brought up together. I would like to hear how they manage it. R. P.

Maine.

Two vigorous cockerels are sufficient in a pen of 50 hens, and they may be either alternated or allowed to run together and fight it out. Usually one will cow the other and there will be little fighting after the question of supremacy is settled. If they are so equally mated as to cause constant fighting the only remedy is to remove one of them, allowing but one in the pen at a time, though in doing this, you lose the advantage of having the hens mate with the most vigorous cockerel. My own practice is to place enough males in the flock to insure fertility, or perhaps more than enough, and allow them to mate indiscriminately, feeling assured that the law of the survival of the fittest will aid me in getting the hens mated with the most vigorous males, whose services I would choose if I could pick them. When running alone, however, it is sometimes difficult to tell which of the two cocks has the most vim. A little competition soon settles it.

M. B. D.

Hens With Intestinal Disease.

Can you help me with my Plymouth Rock pullets? I am feeding as I did last year with success; this year there is considerable bloody mucous with their droppings. They do not appear sick. They have free range when weather permits. Their morning meal consists of a commercial mixed feed consisting of corn, wheat, buckwheat, oats and barley scattered in litter at noon, mashed potatoes, middlings and corn at night. I throw whole corn on the ear in the litters. The potato and corn are quite an economy as they are home-grown. In a couple of weeks they will have skim-milk. Green feed always before them. A. F. D.

Massachusetts.

An occasional discharge of bloody mucus with the droppings does not appear to indicate any serious condition which need cause alarm. If persistent and severe, however, it should lead to investigation to ascertain the cause. Such discharge of bloody mucus indicates more or less severe inflammation of the intestinal tract, and this may be of a catarrhal nature caused by exposure to cold and dampness, the eating of spoiled food, or drinking impure water, or it may be a much more severe inflammation resulting from the ingestion of irritant poisons, putrid food or water, or various forms of disease producing bacteria. You should look well to the foods that you are using to see that none of them are moldy or spoiled, that the hens do not have access to impure water when upon range, or that other unhealthful conditions are not present. See that the hens are not exposed to drafts when upon their perches. When you have skim-milk, it will be well to sour it before feeding as the lactic acid germs present in sour milk are a valuable preventive of diarrhœal troubles.

This Steel Forge
Will Save Its Cost In 30 Days on Your Farm

Make blacksmith bills smaller by doing repair work at home. Our Forges are used by farmers in every State and foreign Countries. Blower is 11½ inches diameter. Hearth is 30½ inches high. Total height of Forge 43 inches.

Positively Guarandeed to be as large, durable, do as much work as any $10 forge made and to be as represented or money refunded.

Special Winter Offers

Until March 31, 1914 we offer our two styles of Farm Forges at **$3.75** and **$4.00** each. 1 pair of tongs and 1 Anvil and Vise combined $1.75 extra. Prompt shipments. This offer may not appear again. Write today Send stamp for Catalog No. 11 and testimonials.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Concentrates With Corn and Oats.

What concentrates should be fed for milk with corn and oat chop? The corn is ground with cob. We have plenty of corn silage and hay, and corn fodder. Hay is part clover and Timothy mixed.
Madison, O. W. R. K.

If you can obtain cottonseed meal to mix with the corn and oat chop, using equal parts by weight of chop and cotton-seed meal, it will be the best thing possible to balance the ration. Oil meal, buckwheat middlings, distiller's dried grains or gluten feed would also be good to mix with the chop, their value being about in the order mentioned. C. L. M.

Milk Ration.

I should like your advice regarding balanced rations for dairy cows. For roughage we have hay, mostly clover, with some Timothy and Blue grass, also good cornstalks. From grains which we raise we have oats, corn and barley. We wish to feed these and supplement to make a balanced ration as economically as possible. Should also like to ask what you would advise for fattening cattle.
New York. M. E. D.

To make an economical balanced ration you should feed all the hay your cows will eat twice a day morning and night, with a good feed of cut cornstalks at noon. For the grain ration I would advise mixing two pounds corn, two pounds barley, and two pounds oats ground together, with two pounds cotton-seed meal and four pounds of wheat bran or dried brewers' or distillers' grains. This will give you very nearly a balanced ration. The quantity to feed must be regulated by the condition your cows are in and the amount of milk they are giving. For mature cows in good condition and in full flow of milk 10 pounds a day of the mixture is a common allowance, divided into two feeds for morning and evening. For fattening cattle cornmeal or corn chop and hominy mixed, equal parts, make a very good combination, beginning with a very small amount and gradually increasing as the animals' ability increases to digest the feed. C. S. G.

Ration for Cows and Heifers.

I have one cow, two heifers, and two last Spring's calves that I do not know how to feed. There is a large quantity of cornstalks, some hay, and oat and wheat straw. All grain must be bought except corn on the cob. At present I am giving bran mash twice a day to the calves and once a day to the heifers, and bran and gluten, equal parts, twice a day to the cow. For roughage feed cornstalks twice and hay once daily. Am I on the right track? I want to give these animals a properly balanced ration to produce the best results and also to feed as economically as possible. S.
East Aurora, N. Y.

Your present system of feeding seems to be very good and if the animals are thriving properly there is no reason for a radical change. The corn which you have (on the cob) must be ground before it will be suitable to feed. It can then constitute 25 to 40% of the grain ration for your cow and 10 to 15% of the ration for the youngsters. Instead of feeding an exclusive bran mash would mix equal parts of bran middlings and ground oats with a little cornmeal added, and feed enough to keep them in a growing, thriving condition. Cornstalks can be profitably fed to cows when cut into inch lengths and fed before they have been allowed to stand out in the weather until dry and tasteless. Oat and wheat straw should be used for bedding instead of feed. Calves and heifers require more attention than older animals and should be fed on good hay and grain, the amount being carefully regulated according to their capacity for consumption which must be determined by their condition and appetite. C. S. G.

Stale Bread for Stock.

I have an opportunity to buy left-over baker's bread for one cent per loaf. Would it be advisable to buy it? What value would it be to feed to hogs, chickens and ducks? Would it pay to purchase it and draw it 10 miles? J. L. K.
Webster, N. Y.

In my experience, which has covered the use of large quantities of stale bread for several years, it appears to be very good feed for hogs, chickens and ducks when gathered and fed before it has been allowed to sour or mold. After it molds enough to turn dark colored it is unfit to feed. In regard to price, one cent per loaf is rather indefinite, as a loaf may weigh a pound or it may weigh half a pound, and still be called a loaf. For this reason it is usually preferable to buy it by the pound. At one cent per pound we find this bread a profitable feed to use, but would not pay any more than this price for it except in small quantities for the purpose of starting young chicks, when it should be used even if it costs 1½ cents per pound. To prepare bread for feeding to young chicks it is first cut into thin slices and dried in the oven until it is thoroughly dry and crisp, when it can be ground or rolled fine and mixed with raw eggs and rolled oats. The mixture to be crumbly when properly prepared for feeding. We also put a small quantity of grit and charcoal with this feed and season slightly with salt. Stale bread is prepared quite differently for hogs and ducks. For this purpose it is soaked with either milk or water and usually fed in a sloppy condition to hogs, but after being soaked for ducks it is mixed with dry ground grain to the proper consistency before feeding. With grain selling at such high prices it is necessary to look for cheaper feeds for our stock if such can be found, and stale bread is certainly a help in the right direction. C. S. G.

Cow Rations.

Will you give me a daily balanced ration from the following feeds available: Wheat bran, cornmeal, oil meal (old process), beet pulp and clover hay. Cow is giving about 10 quarts of milk a day.
Denville, N. J. J. H.

The following combination should meet the requirements in your case. Clover hay, 20 pounds, wheat bran, oil meal and cornmeal, two pounds each, and beet pulp one pound. The beet pulp should be soaked in water before feeding and mixed with the grain. C. L. M.

LIVE STOCK NOTES.

THE American Guernsey Cattle Club states that during the week ending Dec. 12, there were entered in the Herd Register eight bulls and 69 cows, a total of 77; 212 transfers were also recorded. Credits were given to 11 cows producing over 50 pounds butterfat.

Recently an itemized account of feeding a purebred Ayrshire cow was given, and all her milk credited as sold at five cents per quart. If it had been sold to Bordens', as was the milk of the grade Holsteins in the same issue, and as many other farmers would be compelled to do, the income would have been less by about 20 per cent. W. J. M.

It seems evident that those qualities of richness, color and flavor, which characterize the dairy products of the Guernsey, are winning for her a most important place in the estimation of the public. At this writing there are 943 cows, representing 157 breeders scattered from Maine to California, entered in the Advanced Register. The ability to return great value for money spent for feed has earned for the breed the slogan, most economical producers. As an economical cream and butter producer the Guernsey is making her record.

Commissioner of Agriculture Calvin J. Huson, of New York, reports that for the months of October and November agents of his department made 10,545 inspections of foods, milk, veal, oleomargarine, feeding stuffs, and also sanitary inspections. In Greater New York the food inspections were 2,426, milk 2,500, veal 1,459, oleo 2,845. Outside New York City agents of the department made inspection in 716 cities and villages. These figures do not include 3,000 inspections of orchards and nurseries and horticultural shipments during the same period, nor the inspections of State and county farms nor of agricultural lands for intended buyers.

Gloucester Spotted Pigs.

The Mark Lane Express states that in the West of England there is a breed of pigs known as the Gloucester spotted pigs, which have been kept and thought a good deal of locally for a long time. The fame of the spotted pig, however, has ended here up to the present, but the breed is likely to see developments in the future, for at a recent meeting of prominent agriculturists held at Bristol, the local and hitherto somewhat unnoticed pig was the chief topic of comment, and it was decided to form a herd book for Gloucester spotted pigs. From the warm way in which they were eulogised by the farmers attending the meeting, the wonder is, why it has not been done before, as the pigs in question fully deserve all the good things said about them. The probability is that nobody ever thought of it, and though the honour has come late it is pleasing to know that the interests of the spotted pigs as a breed are to be looked after in the matter of having a herd book of their own.

CHICKEN-KILLING HOGS.—One of your readers was asking how to stop hogs from catching chickens. Several neighbors cured them by feeding soda, just common baking soda, in their slop. C. S. L.
Jasper Co., Mo.

GRADE GALLOWAYS.—The use of purebred sires pays in beef as well as milk production. P. H. Ross, county agent for Leavenworth County, Kansas, reports that for several years Mr. Barnes has used pure Galloway bulls on grade cows. The results have been good. He has a herd of 34 cows and heifers now, with each animal true to a certain type. Mr. Barnes is breeding an excellent beef type. His is the only Galloway herd in Leavenworth County.

Molassine Meal

MADE IN ENGLAND

is "making good" everywhere.

but we keep hearing that some dealers who are asked for it try to sell something else.

There is nothing else like it and you want to insist on having Molassine Meal. We prefer to sell you through your regular grain dealer, BUT, if he will not get Molassine Meal for you, write us and we will see that you are supplied.

ANNUAL MEETING OF DAIRYMEN'S LEAGUE.

The annual meeting of the stockholders of the Dairymen's League was held in Newton, N. J., Dec. 11, and directors for the coming year were chosen. This meeting followed an informal one called at Albany, N. Y., on Nov. 28 last, and was held more for the purpose of ratifying and legalizing the work of that meeting than to initiate any new movements. Being a New Jersey corporation, it was necessary that the formal stockholders' meeting be held in that State, but the convenience of the majority of the members required that a more accessible place be appointed where they might gather and express their wishes as to the election of officers and conduct of the League's business. Albany was therefore chosen, and a full report from the officers of the League was made at that place. By a resolution passed by the board of directors, the League's books will be closed on Feb. 1, 1914, and no stock will be issued to new members after that date unless the agreements consigning the milk to the League are signed at the same time. It is necessary that the directors of the League shall know just how much milk they can control before they can enter into any negotiations with buyers, and the agreements consigning milk to the League are of no effect until at least 75 per cent. of the members have signed and returned them to the directors.

The report of the League now shows 290 branches, with 9,500 stockholders, representing over 152,000 cows. The treasurer's report shows a surplus in the treasury, and so far as can be judged by the present outlook the officers of the League should be in position to take some active part in fixing prices for milk at the coming contract period in the Spring. The action of the directors will necessarily be controlled largely by the support received from the members of the League, and they desire that the local branches complete their work of organization so far as possible before Feb. 1, and place them in position to act with a united body of dairymen behind them. M. B. D.

Cat Shedding Hair.

What must I do for my cat? The last few weeks I have noticed that the fur is coming off in places. It does not look sore or inflamed or diseased and it seems to be only in the center of his back. It seems to be spreading down to the tail, but the cat does not seem to be sick or anything wrong. N. B.

Massachusetts.

Give the cat a good brushing once a day and make it take plenty of outdoor exercise. Feed light laxative rations. The trouble is due to confinement, hot quarters and overfeeding. No medicine should be necessary; but if sores appear on the skin, apply a little sulphur ointment once daily. A. S. A.

Skin Disease.

Can you tell me the cause and a cure for black scabs on my pigs, some three weeks old and some are five? It is a hard, thick, black scab, seems to be all above the skin, no depth to it. Sometimes they scratch the scabs off and the skin looks raw and blood red. J. S. S.

Delaware.

This trouble sometimes is termed "pitch mange," and is caused by wet and filth in the pens or beds or yards where the pigs sleep or lie down. Remove the cause and see that the bedding is kept clean and fresh. Keep pigs out of any old, filthy hog wallow or pond; but it would be good for them to bathe in clean water. Many farmers now have concrete wallowing places for their swine, and they now and then put in a little crude petroleum oil, which spreads out on the surface of the water and tends to coat the hogs as they leave the water, this is fine for preventing lice and also is useful in pitch mange. Treat affected hogs by scrubbing them clean with a hot, 1-100 solution of coal tar dip and then apply sulphur ointment daily to remaining sores. A. S. A.

Hog Lice.

I have about 50 pigs—large and small—and they are all bothered a great deal with hog lice. Can you tell me any inexpensive way to get rid of the vermin? The hogs have the run of a large pasture, but sleep in the hoghouses. H. J. I.

Connecticut.

Put a 1-100 solution of coal tar dip into a barrel and souse the pigs in it, tail end first; then bathe the head and neck with the dip and give the pig a good rubbing with a brush. Repeat the treatment inside of 10 days. Clean up, disinfect and whitewash the pens and stables and put in clean bedding. A mixture of two parts machine oil and one part of kerosene run along the backbone of each pig, by means of a large oil can, will prove effective. Use enough of the mixture to ooze down well over the sides. Some men bore a large hole down through the center of a post, then bore in a large hole from the side to meet the center bore and plug this side hole with a soft wood plug, or two holes and two plugs may be made. The central bore is then filled with kerosene and gunny sacking bound around the post covering the soft wood plugs which become saturated with kerosene and keep the sacking wet with it until the supply is exhausted. The pigs use this as a rubbing post and apply the kerosene where it is most required. A. S. A.

Diamond Skin Disease.

Can you give me any information about diamond skin disease in hogs? Last year I had four hogs; two of them, late in Fall, when they weighed about 300 pounds; began to show weakness in hind legs and their skin was purple mostly on back, did not care to stir around, appetite poor, lost flesh. I was advised to give epsom salts and sulphur in feed but they kept getting worse and on one pig the skin lifted from its back; both tail and ears got rashy and smaller. They are kept in barn cellar. We keep a number of horses, straw is freely used. We daily throw this manure into barn cellar and spread around where hogs are kept. They were fed swill from house which is rich and plentiful, they grow fast. We cleaned the cellar thoroughly and whitewashed with hot lime wash. Now I am having the same trouble; one hog killed recently, slaughter house inspector said was fit for food when skinned. The skin of dressed hog was scarlet on back and some places little streaks showed in fat; liver and lungs healthy. We buried that one. Is there anything I can do to be reasonably safe another year? Is it curable? I had one veterinarian to see them and he claimed the cause of it all was that hogs grew fast on feed and then got too hot in manure, cooled off quickly, causing a fever. Still hogs have been here in same place under same conditions for years, and last season was the first time we had trouble with them. The inspector called it diamond skin disease.

Massachusetts. H. C.

"Diamond skin disease" is simply a popular term for "urticaria," or "nettle-rash," or "surfeit," which is akin to "hives" of children. It is caused by derangement of the digestive organs, or liver and as a rule is caused by sudden changes of feed. Change to new corn, or any rich, heating feed, may bring it on. The meat is fit for use, but the affected patches of skin should be removed. That cellar is a poor place for hogs. Better give them a good house to live in, with clean beds and clean bedding. All manure mixing should be done in the yards if at all, or the litter may be spread on a big barn or shed floor, in Winter time, after sprinkling a little shelled corn on the floor. Then let the hogs root the grain and in so doing take needed exercise. This is fine business for sows in pig, as they particularly require exercise. Make the feed more laxative and less rich. Do not feed slop containing much soap or soap powders. Give free access to wood ashes, slaked lime and charcoal. If the trouble starts put the hogs on to a diet of milk, middlings and limewater, and physic with glauber salts in slop. Four ounces of the salts will suffice for a grown hog, but may have to be repeated. A. S. A.

Suspected Rabies.

My two little dogs died this Summer; one died May 22 and the other about a week ago with what we supposed to be poison, but others said they had rabies. Their eyes were full of matter and a slimy looking stuff ran out of each side of the mouth. Just before they died they tried to drink water but could not; they would put the nose down to the water, but it seemed as if they could not open their mouths and put their tongues out. They both had the same symptoms. Can you tell me what ailed them and if there is any cure, and also if it is contagious, as I have a little fox terrier which was around the affected dogs. These dogs that died also had a very bad odor about them. What should I do if I should have another dog sick the same way? A. F. W.

Michigan.

When it is suspected that rabies may be present the owner should chain the dogs and have them examined by a graduate veterinarian. The disease is contagious and conveyed by a bite of the affected animal. There is no cure. It seems possible that your dogs died of distemper; but without an examination we are unable to give a confident opinion, and as rabies was suspected we would not feel justified in prescribing treatment. The veterinarian should be employed. If the fox terrier was bitten by a rabid dog he will be likely to succumb to the disease and should be kept closely confined. If not bitten he will not be likely to contract rabies. Persons bitten by rabid dogs should have the Pasteur treatment applied at once and animals bitten should be confined and closely watched for three months. A. S. A.

THE ROGERS & HUBBARD CO., Address Dept. A, Middletown, Conn.
Office and Works, PORTLAND, CONN.

The Ham said: "I'm cured!" And meant it. Because the farmer—he was a wise one—always used Worcester Salt.

If your meats are in proper condition for curing, Worcester Salt will keep them in prime condition.

Worcester Salt always makes a pure crystal-clear brine, free from sediment. It is this sweet, savory brine that gives your meat a flavor which is as sweet-as-a-nut—the kind of flavor that puts your hams, bacon and salt pork in the "high grade" class.

WORCESTER SALT

The Salt with the Savor

You'll find that Worcester Salt is also the finest procurable for your butter-making. Its pure, even crystals and its freedom from all bitterness make it the perfect salt for all dairy uses.

For farm and dairy use, Worcester Salt is packed in 28 and 56 pound bags. Your wife will find many uses for the bags—they are made of the best quality of Irish linen. Smaller bags too, if desired.

The new and enlarged edition of the booklet, "Curing Meats on the Farm" is now ready. A postal will bring it FREE to you.

AILING ANIMALS.

Death of Sows.

I lost recently two brood sows. One had four pigs, the other eight. At night I fed as usual milk, which was partly sour and part water, about six quarts each with about a one-half pail apples, both sweet and sour. In the morning I found both sows dead, but pigs were all right. The oldest litter eat from same trough as its mother, the other was too young. If it was the milk, why should it not kill the little ones, also four shotes which were fed from same barrel of milk? The shotes had a much heavier feed.

New York. E. C.

This certainly is a strange case; but it seems that the sows must have died of apoplexy, which sometimes follows farrowing, if sows are too heavily fed. It was a mistake to feed the apples, along with sour milk slop. For the first feed a sow that has farrowed should merely have warm water with a little middlings stirred into it and it matters little if she gets nothing more in the first 24 hours. The slop may then be gradually increased in richness and amount; but no sour feed of any kind should be allowed. Injudicious feed was apparently the cause of the sickness and deaths. A. S. A.

Enteritis.

A neighbor has a fine Clydesdale mare, six years old. She is passing through a severe attack of enteritis, and recovery is still doubtful. Upon questioning I found that the mare is in foal. Now this mare foaled a colt last April and when the colt was nine days old she was bred again. What effects would such methods have on the mare, also upon the offspring? T. M.

Horses do not recover from severe attacks of enteritis (inflammation of the bowels) so it may be taken for granted that she has had some other less serious ailment. A severe attack of colic, or impaction, treated with the usual drugs, may result later in abortion. A mare is most sure to conceive if bred nine days after foaling and it is the general custom to have mares bred at that time. No bad results to either mare or foal result, for the mating is natural and would happen were the mare running free with the stallion, on the plains or range. A. S. A.

Stiffness.

I have a Jersey (grade) about nine years old, due to calve December 1; has been out to grass in good weather. She is stiff or lame, forward, and "off her fed." I have been giving her two quarts bran with little oil meal twice daily, also sugar beets and tops, a few cornstalks, and hay. Has not been exposed to bad weather. Can you suggest what the trouble probably is? C. L.

Long Island.

Rheumatism may be the cause, and we would stop all rich feed and give simple ration of hay, roots and fodder. If she is constipated give her a physic of epsom salts one pound, ground ginger root one ounce; salt one-half cupful, blackstrap molasses one cupful and warm water three pints. Give this slowly and carefully, from a long necked bottle, as one dose. Keep her in a box stall while under treatment.

Cow Pox.

My cow has sores on teats and lower part of udder. I have healed some of the sores, but more are coming back. When the sores first appear they look red with yellow head, and about 10 days ago one side of her udder became hard and there the sores came out more plentifully. The cow acts as though it hurts her quite badly. A. J.

New York.

Isolate the cow and milk her last. Wash the hands well before milking other cows, as the disease is spread from cow to cow by the milker's hands. Wash the udder twice daily with a lotion composed of one ounce of granular hyposulphate of soda in a quart of soft water. Piant the sores with glycerite of tannin, as often as found necessary. A. S. A.

Loss of Calf.

Could you tell us what was the matter with a calf which we just lost? Between the skin and flesh there was an inch or more all over the body and hind parts of a substance which looked like meat jelly. It has had nothing but frosted corn fodder for roughage for several weeks and oats for grain, has been tied in barn. She would not drink like the others; bloated badly. C. W. F.

New York.

Such effusions of lymph under the skin are seen in anthrax and in other diseases such as hemorrhagic septicemia. Without an examination we could not say confidently what disease was present; but the latter is most likely and would prove incurable. The frosted fodder was quite unfit for feeding of a young animal and might cause sickness in any animal. We suspect that acute indigestion was present and the chief cause of death. A. S. A.

Staggers.

I have a horse that appears to be all right except that when I leave him hitched he goes to sleep and falls down. He will stand in the pasture under a tree with no sign of going to sleep. I have had him nearly two years. He is in the pasture most of the time, and I never saw him lie down but once, excepting to roll. He rolls a great deal. I don't use him much as I don't have much use for a horse. He works and travels all right and is in fair condition. I don't give him much grain. I have heard that there was what they called sleepy grass in some places out west that makes them sleepy but mine only gets sleepy when he is hitched. Have tried him hitched to a post without the harness on, he goes to sleep just the same. Do you know of any cause or if there is any cure? D. A.

Overfeeding and lack of work cause such conditions. Clip the horse and put him to steady work every day and if there is no work for him to do make him take abundant exercise out doors. Cut down the rations. Make him earn every bite that he eats. Allow him a box stall when in the stable. The horse is in about the same condition as the big rich, idle fat man who asked a doctor to prescribe for his gout. "Earn twenty-five cents a day" advised the doctor and then he added *"and live on it!"* If the horse is free from brain disease he should brighten up wonderfully under the work and spare diet regime. A. S. A.

Itching Skin.

I have a mule which has dirt and dandruff in its hair. It seems to itch and causes it to nip itself and pull its hair up the wrong way. What could I do to prevent this? A. L. W.

Delaware.

Clip the hair from the belly and from the legs above knees and hocks; then groom the mule thoroughly once a day. Feed carrots in addition to oats, bran and hay. Make the mule work or take plenty of exercise every day. If the trouble continues give half an ounce of Fowler's solution of arsenic night and morning until a quart has been used; then gradually discontinue the medicine, taking a week or 10 days to the work. A. S. A.

Stringy Milk.

I have a cow that has been milked two years last October. She lost her last calf November 23, 1911, about four months before she was due, but milked right along just as though nothing had happened, and has up to this time and now her milk seems to be quite cheesy and stringy. The feed consists of corn, rye and oats. J. G. N.

New Jersey.

Bacteria in the milk utensils are the common cause of stringy or ropy milk, and the condition comes on after the milk has been standing for some time. If you find that the milk comes from the udder in a stringy condition, garget (mammitis) is the most likely cause, but extended lactation, as in this case, may result in abnormal quality or composition of milk. Such milk is unfit for use, and we would advise you to dry the cow off at once, or sell the cow to butcher if in good flesh. There is great likelihood that she will again abort her calf. A. S. A.

Feeding Old Horse.

Can an old horse be kept on ground feed and do well without hay or whole grain of any kind. I have a mare, probably 30 years of age. She has done nearly all the work on my small farm for a number of years. She has been running out to pasture during the Summer with but little other feed except that for the last few weeks she has had some apples besides the grass; is now in fine condition, strong and works well. When I put her in the stable for the Winter she does not do well. She cannot or will not eat hay, and oats go through without being digested. If I cut the hay and put meal on it she will try to lap the meal off and leave the hay. Would molasses feed or ground Alfalfa with ground grain be good for her? How would you recommend to feed her leaving out hay.

New York. G. O. T.

She may be able to eat good corn silage, along with crushed oats, wheat bran and cornmeal. It is necessary to feed some comparatively bulky feed to keep the meal particles apart and properly distend and stimulate the muscular action of the bowels. Alfalfa meal may be used, or finely cut clover hay, soaked in hot water until soft, and then well sprinkled with blackstrap molasses diluted with hot water. If you can get her to eat the following mixture she will be likely to do well; Dilute one quart of blackstrap molasses with three quarts of hot water and stir among fine cut hay, 5 pounds; corn meal, 4 quarts; coarse bran, 2 pints, and feed this night and morning, allowing dry meal at noon. If found necessary much larger quantities of molasses can be fed with safety and benefit. Sweet skim milk may also be given to an old horse that cannot chew feed and minced roots may be tried. A. S. A.

Nasal Gleet.

I have a very valuable mare, about six years old, very strangely affected. Last Winter she had what I at first thought was distemper but later concluded was only a cold, as there was no attendant cough—this continued through the Spring, but the discharge was from one nostril only—the left side—and became very offensive, both to sight and smell. The discharged matter was very thick and sticky and light yellow in color. At times it comes in small lumps, for the disease, whatever it is, continues now. There is no veterinarian here, and no one seems to know what it is. The mare's general health seems good—is in fine condition and eats very heartily. Any help you can give will be thankfully received. R. H. W.

Virginia.

This is a serious matter, as there is great danger that glanders is present when a nasal discharge persists and is sticky in character. In such cases the animal should at once be isolated and then a veterinarian should be employed, or if there is no graduate practitioner in the immediate vicinity it will pay to take the animal to one a distance. Glanders is not only incurable and terribly contagious among horses, but also communicable and fatal to man; hence the danger of treating a suspicious case. As there is a bad odor from the discharging nostril it is quite likely that a diseased molar tooth, in the upper jaw on the side corresponding to the discharging nostril, is the cause and the qualified veterinarian could remove the tooth by trephining and giving suitable treatment until discharge ceased and the trephining hole healed up. If he should find glanders present, however, the horse would have to be destroyed, according to State law, and the stable cleansed, disinfected, whitewashed and placed under quarantine. The quarantine would be lifted as soon as it was discovered that other horses had not become infected. As home treatment will not avail in this case, whether it be glanders or a diseased tooth, it should be evident that a graduate veterinarian must be employed.

$1.00 Puts It On Your Farm

THE CHATHAM Grain Grader and Cleaner

Handles 70 Kinds of Seed Grain and Grass Seed

From Wheat, it takes Wild Oats, Tame Oats, Cockle, Rye and Smut.

Cleans the dirtiest Flax. Has special knocker and skimmer which prevents clogging. (Other machines choke up.)

Takes Dodder, Barn Yard Grass and Foxtail out of Alfalfa and Millet "slick as a whistle."

Takes Buckhorn from Clover.

Sorts Corn for Drop Planter.

Famous BEAN MILL. Handles all varieties, takes out the SPLITS, Clay, Straw, etc.

Handles Peas as well as any Grain or Grass Seed. Removes foul weed seed and all shrunken, cracked and sickly grains. Takes out all dirt, dust and chaff. It is also a bully chaffer. Handles 60 bushels per hour. Gas power or hand power. Easiest running mill.

Manson Campbell

For $1.00, I Clean and Grade Your Seed Grain

You can't afford to plant common Seed and take chances on a poor crop, when I am offering to scientifically clean and grade every bushel of your Seed Grain for this spring's planting for one paltry dollar.

Here's my proposition, and if you are a smart man you will write me before sunrise tomorrow:

Send me one dollar and I will ship you, FREIGHT PAID by MYSELF, this improved 1914 Chatham Grain Grader and Cleaner, with all equipment. Clean your Seed Wheat, Oats, Flax, Barley, Peas, Beans, Corn, Grass Seed, etc. Then PLANT those fine seed. AFTER you have harvested a bumper crop, pay me the balance of my low price. Not one penny need you pay, except the $1, until next October. And by October YOUR CHATHAM WILL HAVE MORE THAN PAID ITS ENTIRE COST IN INCREASED CROPS. Then you'll have it to work FREE for you the rest of your life.

Your Dollar Returned

I only want the dollar as evidence of good faith—to protect myself from mischievous boys. If after 30 days' hard test, you don't want my "Chatham," send it back at my expense and I will return the dollar.

A "Made-to-Order" Machine

Every "Chatham" is practically a *made-to-order* machine, for I send you the exact and proper Screens, Riddles, Hurdles and Sieves to grade and clean every *Grain and Grass Seed grown in your locality*. That's the secret of my success. I would not be the leading maker of Graders and Cleaners if I had tried to make my equipment fit ten million farms. What would you think of a clothing maker whose suits were all one size? Wouldn't it be a *miracle* if he gave you a fit. Yet all makers of Graders and Cleaners, except me, send the same equipment, whether you live in Maine, Ohio or Oregon. They wouldn't do that, if they had my 41 years' experience,

Extra Screens Free

I use, all together, 81 Screens and Sieves. It usually requires 15 to 17 for the average farm. These I select from the 81. After 41 years in the business, I am pretty sure to pick the exact equipment needed on your farm. If I shouldn't, just drop me a line and I'll send your additional requirements. There will be no charge for this.

Samples Graded Free

Maybe you have some Seed Grain that you can't clean or grade or separate. Send me a sample. I will purify it and tell you how you can do it cheaply. No charge for this.

Seed Corn Sorted

My big Corn Sorting Attachment, invented 2 years ago, is a great success. Twelve thousand farmers and many leading Agricultural Colleges are using it. It is the only machine I know of which scientifically sorts seed corn for drop planters.

New Book Ready

Send me no money now—just a Postal, for the finest, most complete Book on Seed Selection I've ever written. After the Book comes, write me what size machine you want and I'll ship it, freight prepaid, on receipt of $1.00. Then clean and grade all your Seed Grain. If you write today, you get my Book by return mail. Address nearest office.

WE are in a position to help you with your poultry. The best poultry writers in the country are ready to answer your questions, and will direct you step by step in the development and care of your flock. Through their help you may become an expert yourself, if you will follow their suggestions and take up a line of reading in connection with your practical work in the henyard. This service is free to all subscribers and their families. Make frequent use of it, and begin at any time.

THE EGG-LAYING CONTEST.

The egg production at the contest continues to increase; the fifth week shows a gain of 136 eggs over the previous week, the total for the week being 841. White Wyandottes beat the Leghorns this week. Tom Barron's pen of the above breed laid 48 eggs, taking first place for the week. Francis F. Lincoln's White Leghorns are second with a score of 46. This pen leads in the total to date score, with 172. The only bird in the contest to lay every day in the week, was Tom Barron's White Wyandotte pullet No. 4 The "sour milk" pen of White Leghorns from Storrs Agricultural Station laid 41 eggs, taking third place. Their total is 120. Tom Barron's White Leghorns take fourth place with a score of 34. It looks as if his pen of Wyandottes would beat his Leghorns this year; they are 55 eggs ahead now.

The "Philadelphia North American" is carrying on an egg laying contest at Thorndale, Pa., with five birds in a pen, 100 pens being entered. Tom Barron's pen of White Wyandottes leads all the Wyandottes with 21 eggs for the week, and a total of 55 in the four weeks. Charles D. Bartholomew of Pennsylvania leads all the White Leghorns with a total of 73, and a score for the week of 21. Tom Barron is next with a week's score of 22 and a total of 69. There are seven pens of White Leghorns entered from England, and all but one are among the highest scores.

	Week	Total
Alfred Parkinson	21	60
Frank Toulmin	19	59
G. B. Sharp	10	34
Will Barron	14	30
Edward Cam	14	27
J. Collinson	8	14

Ex-Governor Rollin S. Woodruff of Connecticut has a pen of White Leghorns entered; their total is 48 and week's score 14. Mrs. Woodruff has a pen of the same breed in the contest at Storrs.

A new breed, "Red Pyle Leghorns," entered by Irvin D. Dietrich, Pennsylvania, laid 18 in the week, and total 49.

For the first time in any of the egg laying contests a pen of Light Brahmas are entered, Charles E. Colclough of New Jersey being the man with confidence enough in their egg-laying capacity, to enter that breed. But they have not laid an egg yet. The total score made by the different breeds, follows:

Barred P. Rocks	29
White P. Rocks	21
Buff P. Rocks	44
Columbian P. Rocks	31
Silver Wyandottes	21
White Wyandottes	55
Buff Wyandottes	0
Columbian Wyandottes	31
S. C. R. I. Reds	41
R. C. R. I. Reds	6
S. C. Brown Leghorns	36
S. C. White Leghorns	73
R. C. White Leghorns	0
S. C. Buff Leghorns	0
S. C. Red Pyle Leghorns	49
Anconas	52
Silver Campines	0
S. C. Buff Orpingtons	36
White Orpingtons	16
Silver Spangled Hamburgs	0

One bird in each of four different breeds, laid seven eggs during this week. In the fifth week at Thorndale, 76 pens laid 718 eggs, Tom Barron's White Wyandottes leading with 24 eggs, making his total 79. But Charles D. Bartholomew's White Leghorns laid 21, making his total 94, and Alfred Parkinson's White Leghorns laid 21, making his 81. Comparison of the records made at the contests for the three years, shows the following gains: First year at Storrs the fifth week showed a total for the week of 423 eggs; the second year a total of 698 eggs; the third year at Thorndale 718 eggs. We cannot compare the third year here at Storrs, because there are 10 birds in a pen this year instead of five, as in former years. But about half of the entrants at Thorndale are the same ones who had birds in the first and second contests at Storrs, and as there are five birds in a pen at Thorndale the comparison of yields is fairly made.

As the output shows an increase each year, it is evident that we are making progress in breeding better utility fowls; and that these egg-laying contests are furnishing the needed stimulus to American utility breeders, which will result eventually in an increased average production by American poultry.

GEO. A. COSGROVE.

Doves and Pea Fowl.

Can you tell me about the breeding of doves and the market for them?

Sergeantsville, N. J. H. C. K.

The term "dove" is used to designate certain wild species of birds very closely related to our domestic pigeons. I know of no market for them, or of any reason why people should raise them. There are several species of these doves which are kept in very limited numbers in cages by lovers of birds and other naturalists. They usually mate for life and live together during all seasons of the year. The only possible market there would be for them would be to zoological gardens, and there are very few people who care to have them in a cage, because of their affectionate disposition and gentle characteristics.

What can we do to make our young pea fowl healthier?

Pea fowl usually are quite healthy and free from diseases. It is a very frequent thing in breeding rare birds of this kind to inbreed them without any careful selection, with the result of rapidly deteriorating the vigor and stamina of the offspring. I would recommend another year that unless the parents are exceptionally strong and healthy and of no relation the inquirer change blood and that from the time the birds are five or six days old until they are nearly grown, he supply them with sour milk, both to drink and to eat in a thick clabbered form.

A. L. C.

Vermin on Hens.

I have a fine flock of White Wyandotte hens, that stopped laying about a month ago, and since then several have died. On examining one I find they are just alive with large lice, of a reddish color. The hens are getting very poor, although I feed them well. I have used insect powder on the hens but it does not do any good. Will you let me know what to do for them? J. C. D.

Your hens are doubtless suffering from the ravages of red mites, and probably, also, of body lice. These mites, which are the most serious pest of the two, do not stay upon the fowls through the day unless they are present in enormous numbers. They hide in cracks and crevices about the perches and nests, and may often be found in great masses beneath a loose board or under a perch support. They come out at night to suck the blood of their hosts and return to their retreat for the day. To get rid of them, clean up thoroughly, removing loose boards and other objects behind which the mites may hide. Then paint or spray perches with a solution of one quart of crude carbolic acid to the gallon of kerosene. With a long nozzled spring bottom oil can squirt this mixture into such cracks about the perches as you cannot otherwise reach; spare no place where the mites may hide. A little close search will probably show you thousands of them where you did not dream that any existed. If you have a nest box nailed up against the wall, tear it down and look at the crawling mass of mites behind it, red with the blood of your hens. After doing this, clean up and whitewash the interior of your henhouse, furnish your fowls with a good dust bath, and make frequent search, oil can in hand, for the vicious red mites in all places where your observation will show you that they hide.

EMPLOYER: "Yes, I advertised for a strong boy. Do you think you can fill the bill?" Applicant: "Well, I just finished lickin' fourteen other fellers that were waitin' out in de hall."—Boston Transcript.

AN insurance agent was filling out an application blank. "Have you ever had appendicitis?" he asked. "Well," answered the applicant, "I was operated on, but I never felt quite sure whether it was appendicitis or professional curiosity."—Ladies' Home Journal.

DOWN in New Orleans one day an old negro mammy entered a store, attracted by a window full of gayly colored cheap soaps on special sale. "Gimmie fo' fi' dem yar cakes," she said. "Will you have them scented or unscented?" asked the clerk. "No, Ah don' want 'em sended, foh Ah'm gwine take 'em wif me," she answered.—Credit Lost.

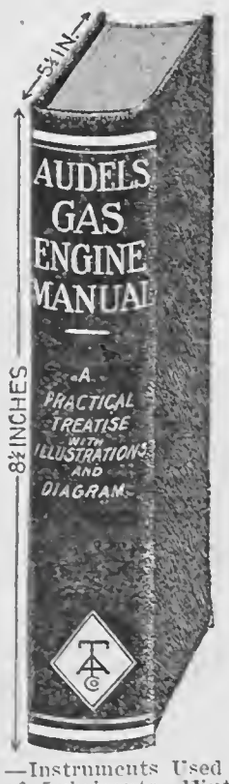
AUDEL'S GAS ENGINE MANUAL



THIS volume just published gives the latest and most helpful information respecting the construction, care and management of GAS, GASOLINE and OIL ENGINES, MARINE MOTORS and AUTOMOBILE ENGINES, including chapters on PRODUCER GAS PLANTS and the ALCOHOL MOTOR

The work is divided into 27 Chapters as follows: Historical Development—Laws of Permanent Gases—Theoretical Working Principles—Actual Working Cycles—Graphics of the Action of Gases—Indicator Diagrams of Engine Cycles—Indicator Diagrams of Gas Engines—Fuels and Explosive Mixtures—Gas Producer Systems—Compression, Ignition and Combustion—Design and Construction—Governing and Governors—Ignition and Igniters—Installation and Operation—Four-Cycle Horizontal Engines—Four-Cycle Vertical Engines—Four-Cycle Double-Acting Engines—Two-Cycle Engines—Foreign Engines—Oil Engines—Marine Engines—Testing—Instruments Used in Testing—Nature and Use of Lubricants—Hints on Management and Suggestions for Emergencies—The Automobile Motor—Useful Rules and Tables.

Each chapter is illustrated by diagrams which make it a thoroughly helpful volume, containing 512 pages, 156 drawings, printed in large, clear type on fine paper, handsomely bound in rich red cloth, with gold top and title, measuring 5½x8½ inches. The book is a practical educator from cover to cover, and is invaluable to any one using a gas engine of any type or size.

These books are not given with a subscription to the R. N.-Y., but are given to the agent as a reward, in place of cash, for extending the subscription list of the R. N.-Y.

MAKE HENS LAY
Lots of eggs by feeding green bone fresh cut, because it is rich in protein and all other egg elements. You get twice the eggs—more fertile; vigorous chicks; earlier broilers; heavier fowls; bigger profits. **MANN'S** LATEST MODEL **BONE CUTTER** cuts all kinds of bone, with adhering meat and gristle, easy, fast and fine. Automatic feed; open hopper; never clogs. Book free. 10 Days' Free Trial. No money in advance.
F. W. Mann Co., Box 15 Milford, Mass.

PUBLISHER'S DESK

Our renewals of subscriptions have continued to increase up to Christmas, but as previously stated, we were a little short during the first weeks of December; and while we have no concern for the future, we do wish to ask our friends to send in the renewals early. It will save us much extra work, and confusion, and at the same time make it possible for us to devote ourselves to your service in other ways.

We are receiving many kindly words of appreciation for the enlarged Woman and Home Department, which began in the December 20th issue, and which is to be a monthly feature for the future. The next issue will be January 17. It is our purpose to make this worthy of the best traditions of the farm homes of this country, and we realize that this purpose means work and study and expense. We are prepared for it all. The first attempt was only an intimation. We expect to make it better and stronger as we go along. We have some of the best men and women in the country to help us with it, and with the coöperation of our own subscribers, men and women, we will make it a feature in the literature of the country.

With the beginning of the new year, we have decided to reject all produce commission merchant advertising for the future. For many years we have carried small cards for commission houses that we believed could be safely entrusted to handle farm products in the New York market. We always refused dozens of orders where we accepted one. But we have had frequent complaints from the best of them; and, while we have no proof of irregularities in the business of the houses that we have advertised, we have had complaints that have not been explained to our satisfaction. In the future as in the past we will, on inquiry, give our subscribers the names of commission houses with financial ratings, and with good standing in the trade; but we will not accept their advertising, nor will we be in any way responsible for them. We will, however, as in the past, receive complaints from our subscribers and do what we can to adjust them.

Edward F. McAvoy, the famous Houdan chicken man of Cambridge, N. Y., pleaded guilty in the Federal Court of Utica, N. Y., before Judge Ray on December 16, to indictment for using the United States mails with an attempt to defraud and was fined $750. McAvoy was indicted at the Binghamton term of the Federal Court in June last and was under a bond of $5,000. The charge against him was that he advertised pure-bred fowls and sold mongrel birds on orders received through the mail. There were many charges against him, from all parts of the country as far as Texas. If the case had gone to trial and the defendant was convicted, there would probably have been a prison sentence in addition to the fine, but in view of his saving the State the expense of a trial, and for the further reason that a prison sentence would embarrass his wife and child and sacrifice his poultry and farm interests, the court was lenient and confined the penalty to a money fine.

New York. B. F. E.

This ought to prove a restraining lesson for Mr. McAvoy. It is several years now since THE R. N.-Y. had occasion to criticise Mr. McAvoy and to caution its readers against his methods of poultry selling and his record and manipulation, and we have felt the necessity of repeating the caution on different occasions since. THE R. N.-Y. has no disposition to follow Mr. McAvoy further, but the public, who buy poultry through the mails, have a right to know his past record in the matter. If he will now take his lesson to heart and devote himself honestly to the poultry business, his past may be forgotten, but we caution him that a repetition of the old methods can only result in greater embarrassment to him.

The E. A. Strout Farm Agency has again been in court and has again gone down in defeat. This time the scene was laid in the Bucks County, Penn., courts. The action grew out of the sale of the Frantz farm near Quakertown to Mr. Harry Reisma. The sale was put through by George G. Cupp and W. K. George, representing the Richland Real Estate Company. It seems that George and Cupp had previously been in the Strout employ, but had left, and the contract was put through after the discontinuance of the services. On some theory that does not appear definite in the reports, the Strout Company caused the arrest of Mr. Cupp on the allegation that in accepting the fee for the service he had become guilty of embezzlement or larceny of a fee which the Strout Agency claimed belonged to them. The testimony seemed to show that the transaction was put through by Mr. Cupp as agent, and the commission paid to his attorney and afterwards turned over to himself and his partner. Receipts for the money were exhibited in court, and the transaction shown up in full, and the jury quickly brought in a verdict of not guilty.

This adds one more defeat for the Strouts in their legal battles growing out of contracts with agents and with farmers. From the number of complaints that we have received from Bucks County and from the temper of the people as we found it there, Bucks County would seem to be about the last place in the world where the Strouts ought to expect to get away with a technical advantage against a farmer or agent. If they had an enforceable claim the civil court would seem to be the place for a contention of this kind, but it was reported from the evidence that the Strout representatives admitted that it is their policy to prosecute claims in the criminal court. Some promoters and enterprising concerns seem to think that an appeal to the courts gives them the presumption of sincere contentions. They figure too that prosecutions have the effect of intimidating hesitating opponents, and besides justice is not by any means sure, and they have a chance of winning out in a weak case, if they put up bold enough a front. The records of the Strout Agency are, however, pretty well established in Bucks County, Pa., and a defendant against them is pretty sure of an intelligent judgment in that territory.

Were you to see the financial tragedies that are being enacted in this valley, by unwilling actors, lured to their ruin by bandits and buccaneers, commonly known by the name of real estate dealers, I am sure your heart would beat in sympathy with mine, over the blasted hopes and ruined fortunes of the victims of these schemes. There are more abandoned homesteads here than in any part of the State of California which it has been my privilege to visit, and you know that I get around about as much as the average person. I read very long articles by unwise boosters and uninformed writers who seem to be paid for their ability to paint word pictures from a lively imagination, with the result that many a hard-working family are separated from their savings of patient toil of years, and left to begin the struggle of life anew, with energies impaired, and the feelings of discouragement to contend with as well.

California. P. D. B.

The above letter comes to us through a mutual friend of the writer's in California. It was simply a paragraph in a friendly letter; but is so much in line with the conditions we find here in the East it was forwarded to us as an encouragement to show that others on the Pacific coast are confronted with the things we are fighting here. The mutual friend who sent us the correspondence added the following paragraph in his reply:

No better work can be done by any paper than this in making exposures of such fake real estate men. When in Florida I have felt terribly saddened by seeing the men stranded there who would give anything if they could only get back enough of the money they invested in the fake lands to return to their old homes in the North. W. A. B.

Pennsylvania.

Families who think of giving up their homes in settled sections of the country, and moving to the South and West to lands offered by these real estate promoters will do well to commit these two paragraphs from these two private letters to heart and recite them daily with their evening prayers. We have had reports aplenty to confirm these personal observations and we hope no R. N.-Y. reader will take up land contracts anywhere without first visiting the land and learning of the conditions in the neighborhood. J. J. D.

"TOMMY your subscription for the boys' paper has expired. Shall I renew it for you?" "Don't care dad, but it isn't as good as it used to be." "What do you mean—are the stories not as good?" "Everybody says it's no good—even the postoffice calls it 'second-class matter.'" —New York Tribune.

Heating a Brooding House.

I have a small brooder house 32 feet long by 10 feet wide, partitioned off in four pens, making the pens 8x10 feet, six feet high in front and four in back; ceiled sides and overhead. One end of this house is built against a small feed house with a basement cellar. Do you think it would be practical and not too expensive to put some kind of a heater in this room under the feed house and run pipes through into and down the length of the brooder house to heat it with the use of hovers to raise a few chickens in each pen? I have always used small brooders in this house, heat with lamps but as it is near my house and barn I am afraid of fire from the lamps. What kind of a heater should be put in, and what kind of hovers? L. L.

Pennsylvania.

Yes, this is the method of heating hovers used in many large poultry plants. Heaters are manufactured for this purpose and hot water pipes are run through the building at the proper height above the floor; hovers for the chicks being placed over these pipes. I would suggest that you write one or two of the large manufacturers of incubators and brooders, state your problem, and ask for plans and figures upon the cost of installation. They will be glad to furnish them.

Poultry Ration.

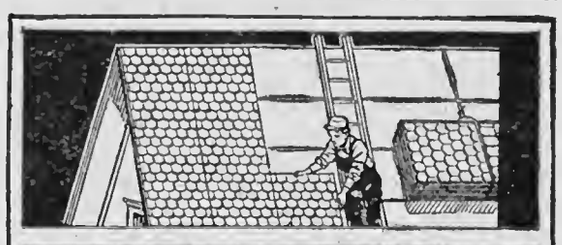
My 80 hens and pullets are W. Wyandottes and R. I. Reds, both fullbloods. I keep a mash by them at all times composed as follows: 52 pounds cornmeal; 32 pounds ground oats; 66 pounds middlings (wheat); 35 pounds bran; 14 pounds linseed; 14 pounds Alfalfa; 60 pounds beef scraps. To every 16 parts by measure one part charcoal and to the whole one part salt. I keep grit and oyster shells by them and give some green food; sprouted oats or beets. I have raised 80 or 90 bushels of oats, 12 bushels wheat, 30 bushels barley and 115 corn on ear. Will you tell me in what proportion to mix these whole grains to feed? I do not wish to have what I raised ground. Do I give animal food enough? My hens have just got over their moult and are beginning to lay. My pullets have not begun yet. How many quarts of whole grain should I feed per day?

New Hampshire. R. C.

Sixty pounds corn; 60 pounds wheat; 30 pounds barley; 30 pounds oats; would make a good proportion in which to mix your whole grains. Your mash mixture contains a large proportion of meat food, therefore, a little excess of corn in the whole grain mixture will be balanced by it when your small supply of wheat is exhausted. Your mash is expensive but should bring good results in eggs. Your 80 hens will need from four to six quarts of whole grain, twice daily. Do not give them more than they will quickly clean up and show an appetite for more at the next feeding time. Wyandottes and R. I. Reds are more easily overfed than the lighter and more active breeds.

M. B. D.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page. : : : :



STEEL Shingles or Wood???

Will you buy wood shingles, which **burn** and **rot,** or Edwards **Steel** Shingles, which are absolutely **rot-proof** and **fire-proof?**

Will you buy wood shingles, **that have** to be nailed on **one at a time,** or Edwards Steel Shingles, that go on in clusters of **100 or more?**

Will you buy wood shingles at a big price from a retail dealer, or Edwards Steel Shingles at **low prices,** direct from the biggest maker of sheet metal products?

The time to decide is now—**before you have invested your good money.**

Edwards Steel Shingles

Factory Prices—Freight Paid

Don't judge Edwards Steel Shingles by common galvanized roofing—which always rusts. We have invented a method that absolutely **prevents** rust from getting a foothold, as 125,000 delighted owners of Edwards Roofs have found. It's the famous Edwards **Tightcote Process.**

No painting, no extras, no tools, no expert workmen needed. Hired man can do it with hammer and nails, in "jig time." Put 'em on right over old roof or on sheathing. Outlast **four** ordinary roofs. No dealer's profit to pay. Sold direct from factory to user. And we now pay the freight!

Send Coupon Below

Rush a letter or postal to us tonight. Give size of roof if you can. If you can't, simply send us the coupon below. Our Special Price Offer, Roof Book 173, will come "a-flying"—**by return mail.**

Stocked Leg.

About two months ago my horse got a small cut just above the hind hoof. The leg became badly swollen to the body, and though the cut healed with proper treatment. The leg remains large, or in other terms it has resulted in a stocked leg. What can you advise.
New York. J. L. L.

Three times a day give the swollen leg a good hand rubbing; then wrap it in cotton batting and bandage snugly. At night rub with druggists' soap liniment and bandage when dry. Make the horse take plenty of exercise every day and occupy a box stall when in the stable.
A. S. A.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages.

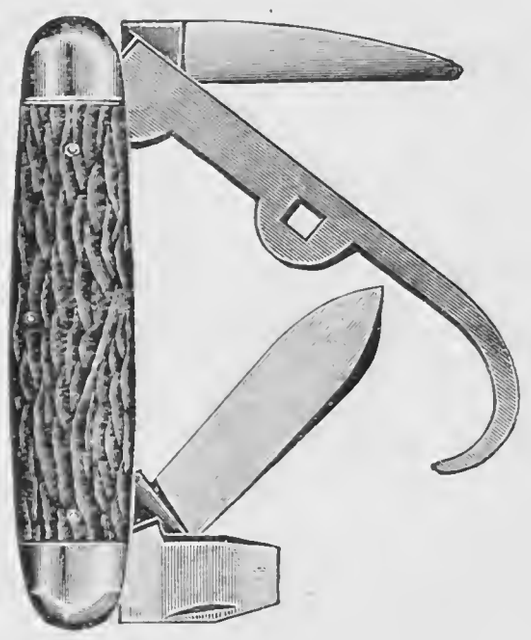
Price, $6,000; terms half cash; balance on mortgage at 5 per cent. Address, FRANK GIVENS, Dryden, N. Y.

THE NEW HANDY FARMER'S KNIFE AND TOOL KIT



It Carries Four Distinct Blades:

A large regular cutting blade; a Lock-Screw-driver Blade; a Belt Punch Blade that can be used for boring holes in leather, any size to one-half inch in diameter; the Hook Blade for cleaning horses' hoofs, and to clean out borers from fruit trees or removing Cotter pins from automobiles and other machinery. The little wrench fits the nut on a Prest-o-Lite automobile light or any small nut.

In fact this handy article can be used for hundreds of purposes. The blades are of S. & G. Wardlow's highest grade bar steel, hand forged and hand ground; tempered by an expert process. Every blade is thoroughly tested. The lining is of brass and bolsters of highly polished steel. The handle is neat and attractive. The whole is just the size of a good jackknife (exact size of picture), and so constructed that when the blades are closed the knife will not catch and tear the pocket.

One of Our Friends Writes:

"This is a great farm knife. We have carried one for months. Not long ago the horse began to limp. We found a small stone wedged in against the shoe. No pulling or pounding could release it, but a quick jerk with the little hook and the stone was out. Who has not been caught far away from a screw-driver with a screw working loose? What do you care when right in your pocket you have the strong little short blade here shown? We will guarantee you have had a strap break on the road and had to cut a new hole with your knife. The grooved blade permits you to make just the hole you want without damage to the leather or to cold fingers. Then the short strong cutting blade will do anything which a pocket edge should do. The Roman soldiers conquered the world with their short swords because these blades brought them right up to business. It is just the same with this short blade. There is power and edge to it. In fact this is a perfect workshop good for any farmer."

It is a whole Tool Kit embodied in, and taking up, the size of a jackknife. *Bear in mind that these blades are fastened to and are a part of the knife.* You cannot lose the blades as is the case with similar tool kits.

Would Make a Splendid Present.

Given for One New Yearly Subscription at $1.00; or Two Yearly Renewals at $1.00 each; or Ten 10-week Trial Subscriptions at 10 Cents each.

These articles are not given with a subscription to the R. N.-Y., but are given to the agent as a reward, in place of cash, for extending the subscription list of the R. N.-Y.

LUMBER PRICES

BUILDING MATERIAL PRICES

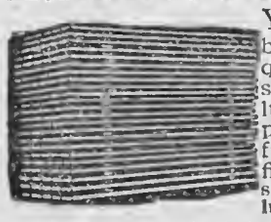
Here is the Greatest Sale ever advertised—the opportunity you have long sought for—a chance to buy staple lumber and building material—Roofing, Wire, Fencing, Furniture and Household Goods of every kind and description, in fact, Merchandise of every nature, at unheard of low prices.

We are determined that the Spring of 1914, will be the most successful in the history of this Great Company, and the Wise man will take early advantage of the great bargains shown in this advertisement.

You can order a complete carload of building material from us, including everything you need to construct and equip and we will ship it to you, without one cent cash in advance.

All we want to know is that the money will be paid us as soon as the material is received, unloaded and checked up.

Lumber Prices S-m-a-s-h-e-d



Yes, we mean smashed. Absolutely busted to pieces. That's our policy. We quote prices on lumber that will positively save you big money. If you will send your lumber bill we will send you a freight paid price that will mean a saving to you of from 30% to 50%. Every stick is absolutely first class, brand new and fully up-to-grade such as you would buy from any reputable house in the United States.

We have determined that the year of 1914 is going to be the Banner year in our great lumber department. We have on hand 20,000,000 feet of high-grade lumber suitable for the construction of Buildings, no matter for what purpose intended. Come to our great yards in Chicago and let us show you this stuff actually in stock. No other concern in the world has a more complete stock of everything needed to build, whether Lumber, Shingles, Structural Iron, Plumbing, Heating, Doors or anything else that you may need. Do you know that lumber is getting scarcer and scarcer every year? Yet our prices are lowest and will continue so until our stock is gone. WRITE TODAY.

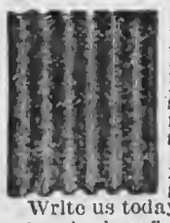
ROOFING PRICES SMASHED!

Galvanized Steel Roofing Is Fire, Water and Lightning Proof



We bought 20,000 squares of this Corrugated Iron Roofing, which we offer at this remarkably low price. It is new, perfect, and first-class, but light weight. The sheets are 22 x 24 in. x 1¼ in. corrugated. Our price of $1.25 per sq. is f. o. b. cars Chicago.

When ordering this item, specify Lot No. CD-700. This is not galvanized, but black steel roofing.

$1.25 per 100 sq. ft. buys best steel roofing

Write us today for our special FREIGHT PREPAID PRICES on new, galvanized roofing. We are offering prices lower than ever before offered in the roofing business. Galvanized roofing at $2.75 per square and up. Ask for free samples. We can furnish anything needed in Roofing, Siding or Ceiling.

62c Per 108 Square Feet Buys Best Rubber Surfaced "Ajax" Roofing

Here again we show the lowest price ever known for roofing of quality. This smooth surfaced roofing we are offering is our one-ply "Ajax" brand, and the price includes necessary cement and caps to lay it; this price is f. o. b. Chicago; at 85c per square, we pay the freight in full to any point East of Kansas and Nebraska and North of the Ohio River, provided your order is for at least 3 squares. Prices to other points on application.

Roofing is guaranteed to wear as long and give as good service as any Ready Rubber Surfaced Roofing on the market. It is put up in rolls of 108 square feet and contains 3 to 4 pieces to the roll. We have other grades of Ready Roofing, which we offer at prices easily 30 per cent below regular quotations. Write today for free samples and Roofing Catalog. Fill in the coupon.

CHICAGO HOUSE WRECKING CO.

Now operated under the name of

HARRIS BROTHERS COMPANY

FOR 22 years the CHICAGO HOUSE WRECKING COMPANY has been well and favorably known to the public. During all these years the four Harris Brothers have been the executive officers and owners and for that reason have finally decided to operate under the name of HARRIS BROTHERS COMPANY.

There is no change in our business, except that in the future the four Harris Brothers will advertise and sell their goods, heretofore advertised and sold under the name of the CHICAGO HOUSE-WRECKING COMPANY, under the new name of HARRIS BROTHERS COMPANY.

Why We Are Called the Great Price Wreckers

Consider what becomes of the stock of goods, when a manufacturer or big retail merchant goes bankrupt or "busted" as the saying goes. It is estimated that about ten thousand merchants annually meet with business disaster—this is why our company exists. If the stocks are sufficiently large and the goods are new and desirable, they find their natural way to our great forty acre plant for distribution at a small added profit, to our thousands of customers, who in this way get the benefit of wonderful bargains. In many cases our prices do not even represent the original cost of production. We stand foremost in our line. We recognize no competition. That's why we are called "THE GREAT PRICE WRECKERS."

Our Binding Guarantee

We guarantee absolute and complete satisfaction. There is no half way about this guarantee. Every purchase you make from us will be exactly as represented and you will be satisfied in every way, or we will make such just amends as are within our power. We will take back any unsatisfactory article at our freight expense both ways and refund your purchase price. We refer as to our responsibility to the publisher of this or any other publication or any bank or express company and to the public at large.

We Sell Practically Everything

Our stock includes practically "everything under the sun." It's in truth, from a needle to a locomotive. No matter what your vocation, or what position in life you occupy, or what your business, or how great a merchant you are, you have use for us, and we have the goods that you can buy from us to a decided advantage. The quicker you learn to recognize this fact, the sooner you will be "putting money in your pocket."

Our stock includes Building Material, Lumber, Roofing, Sash, Doors, Millwork, Wire and Fencing, Hardware, Plumbing Material, Heating Apparatus and Supplies, Furniture, Household Goods, Rugs, Stoves and everything needed to furnish or equip your home, your club or hotel. It includes Groceries, Clothing, Dry Goods, Boots and Shoes, Furnishing Goods and every single article to clothe a man, woman or child. It includes Sporting Goods, Fishing Tackle, Hunting Outfits, Tents, Guns, Harness and Vehicles, Jewelry, Sewing Machines, Clocks; also structural iron needed in construction of buildings, bridges, etc. Machinery, gasoline, gas and electric power outfits. In fact you cannot think of a single manufactured article that we cannot supply you at a saving in price. Let us convince you—it means but little effort on your part to prove the truth of all we say. Write us today for our Catalogue and literature. Fill in the coupon shown below.

THE GREAT PRICE WRECKERS

A THOUSAND PAGES OF BARGAINS

Write us today for a copy of our Great Big Spring Price Wrecker now off the press. It is the most stupendous Book of Bargains ever produced. It contains a thousand pages of matter true to life and describes the merchandise we are offering for sale so plain and correct that you will experience no trouble in making your selections.

It is a wonderful book of Bargains and can be used every day of your Buying Life. You need it whether you are a customer of ours or not.

WRITE US TODAY.

We are the originators of a system of selling practically complete Houses direct to the consumer, at a great saving.

We eliminate all in-between profits. We sell and ship direct to you from our own stocks.

Great care and study has been given all our Plans. Economy is the watch-word both in materials and construction.

No Worry No Loss No Waste

Our Binding Guarantee both as to quality and quantity goes with every sale.

Write us for letters from people in your vicinity who have bought from us. We have thousands of unsolicited testimonials.

SPECIAL INFORMATION

If you intend building, you will lose money if you don't write us at once. Tell us what you want. We will answer you promptly and give you valuable information regarding building. Send rough pencil sketch showing the kind of house you want. We will make you a freight paid price that will save you big money on material necessary to build same. Every stick first class.

If you intend to make improvements, write us what they are, and we will help you to save money on your purchases.

Our FREE BOOK OF PLANS

Our Book of Plans contains 120 pages of different kinds of buildings. Everything from a 2 room Portable House for $117.50 to the finest kind of a residence.

Houses are completely illustrated showing the floor plans, prices, etc. And it's free.

Wire and Fence Prices Smashed!

Barb Wire Less Than 2c Per Rod

Now Galvanized, heavy weight barbwire, put up on reels about 100 lbs. to the reel. Lot 2-CD-36 per 100 lbs. **$1.95.** Galvanized barb wire. Light weight, best grade, best made. Put up exactly 80 rods to reel, 2-point barbs. Lot 2-CD-28, per reel, $1.40.

WIRE NAILS, Per Keg, $1.28

5,000 kegs, put up 100 lbs. to the keg mixed, all kinds together, regular nails, such as made by nail factories. Lot 2-CD 33, price per keg, $1.28. 1,000 kegs of 10 penny-weight regular new wire nails, 100 lbs. to the keg, while they last, per keg, $1.85. Write for our free Wire and Fence Catalogue. Gives valuable information to any land owner. Fill in the coupon below.

Smooth Galvanized Wire Per 100 Lbs. $1.13

It is suitable for fences, stay wires, grape vines or for any ordinary purpose where wire is used. This galvanized wire is irregular in length—it ranges anywhere from 50 to 250 ft. $1.13 is our price for No. 9 gauge. Other sizes in proportion.

15c per Rod Buys Heavy Hog Fencing

Here is another one of our remarkable bargains. A good heavy fence, bought from Ohio flooded factory, perfectly adapted for hogs and general farm purposes, 26 in. high, square mesh, put up in suitable size rolls. Lot 2-CD-31, price per rod 15c. Other heights in proportion. Staples, 100 lbs., $1.75.

BEST QUALITY PREMIER, MICHAELSON READY Mixed House PAINT

95c Per Gal.

Our paint department is under the personal supervision of Mr. V. Michaelson, for 30 years the foremost paint man in America. His picture has appeared on over 8,000,000 cans, and his name is known from ocean to ocean. Paint of quality is his specialty. Every gallon has our strongest guarantee. Our Ready Mixed Barn Paint at 56c a gallon will outlast any similar paint produced. If you want quality paint, write us or write to Mr. Michaelson if you prefer. Finest, most valuable paint book ever published sent FREE. Send coupon.

LETTERS FROM CUSTOMERS

$1,000.00 Saved

Everything arrived in good condition. I saved on the building; also heating plant and bathroom outfit about $1000.00 as this kind of lumber would be very dear here.

Signed (LEWIS YOUNG, Pennsylvania.

$700.00 Saved

I am perfectly satisfied. Don't be backward in referring to me, for you have done more than you agreed to. I saved $700.00 and also got better material, and a better house.

(Signed) JOHN J. DUNN, Ohio.

Satisfied With Furnace

The furnace I got from you is perfect in every way. I would not be without it one winter for double its price. If farmers only knew how easy it is to install it, they would not be without it.

(Signed) HENRY D. CHARTER, Canada.

Used 12 Years and In Good Condition

Some 10 or 12 years ago, I bought quite a bill of Black Corrugated Roofing from you, and only painted it twice since I laid it, and it is in just as good condition today, as the day it was laid. Please send me your catalog, as I expect to put up a barn next Spring and am looking for something for a roof as good as that bought from you last time. (Signed) W. W. STODDARD Ohio.

Will Order More

Am pleased to say the roofing all here and in splendid shape. Allow me to congratulate you on prompt delivery. You will receive more orders from me. (Signed) D. DUCELLO.

Recommends Our Paint

I have used your Premier Paint in this salt atmosphere for the past four years and find it better for this climate than any paint I can buy, no matter what the price. (Signed) W. A. WEIDE, Florida.

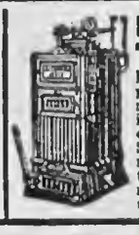
$13 BUYS COMPLETE BATHTUB

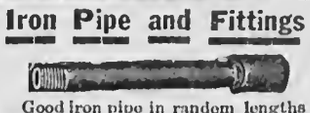
This is a white enameled, cast iron, one-piece, heavy roll rim bathtub; fitted with the latest style nickel-plated trimmings, including Fuller double bath cocks for hot and cold water, nickel-plated connected waste and overflow and nickel-plated supply pipes. It is 5 ft. long and is good enough to answer the needs of any one. Lot 5CD-101.

Hot Water Heating Plants



We are headquarters for steam, hot water and warm air heating plants. They are suitable either for new or old homes. It is easy to install one of these plants in your old building. For this great Fall Sale of ours we are offering a warm air heating plant large enough for the ordinary 6 room house, with all necessary plans and complete instructions for installing, for $46.00.

Iron Pipe and Fittings



Good iron pipe in random lengths complete with couplings, suitable for gas, oil, water and conveyance of all liquids; size 3-8 to 12 inches; our price on 1-in. per foot 3c; 1 1-4 inch at 4c per foot. Complete stock of valves and fittings. Send us your specifications.

AXMINSTER RUGS at 75c

We bought at New York Auction an enormous stock of high grade, brand new rugs and floor coverings. This is a sample of our money-saving bargains. Write for complete Free Rug Catalog, showing actual colors.

FURNITURE

We are the World's Bargain Headquarters for the Outfitting of your home, club, lodge or hotel, from the very latest to the finest. An assortment of Household Goods and everything such as will be found in no other institution in the land. Write for free copy of our Furniture and Household Goods Catalog.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Cornell University Library 2713

VOL. LXXIII., No. 4237. NEW YORK, JANUARY 10, 1914 WEEKLY $1.00 PER YEAR.

THE HOME MARKET FOR POULTRY.

Great Value of Plymouth Rocks.

Again in the harness, after a lapse of some years from actual work with poultry, I find the situation much improved. It is a safe guess that the high price of beef has been the means of higher prices and improved demand for poultry products. A five-pound roasting chicken that some seven years ago retailed for 90 cents now commands $1.35. The 50 per cent advance is in large part increased gain. My staple whole grain is wheat, now selling in my section at $2 per hundred. I have paid $2.25, and occasionally as high as $2.50, in the days of lower prices for poultry products. I estimate the cost to grow a chicken to weigh five pounds at five months at 60 cents for purchased feed. Green feed, while very essential, stands for no cash outlay. This leaves a balance of 75 cents to show for labor.

It is my contention that poultry raising in New England is a safe and sane proposition. It is the custom just now to magnify the egg, possibly the result of the boom on egg contests, a thing which is to be deplored as tending to set an undue emphasis upon that form of increase. A score of chickens might be grown and profitably marketed to one at present, on the basis of the value in dressed poultry. Of these, three-quarters of the pullets, as well as the males, could be advantageously marketed, leaving only the choicest for laying and reproduction. If these were of the general purpose type, which not only give better and more flesh, but continue egg development with the shortening days, a thing the special egg-breeds find it difficult to do, the consumer would not suffer shortage.

FOUNDATION STOCK FOR FARM IMPROVEMENT. FIG. 10.

Much gratuitous advice is being given to farmers as to the growing of cattle to meet the extortion in prices; but the high price of meat will never be lowered by Eastern-grown beef. We all know that cheap ranges for the herds in the West are fast going. It is a fair guess that if a considerable proportion of the talent seeking rainbow opportunities in the West would buckle down to producing right here in the East what the hungry are clamoring for, we should have the logical solution of the high cost of living. And the poultry business, if conducted with the double aim of eggs, especially where demand is greatest, and a quality of carcass far beyond the average, and actually costing less to grow than the average, would do much to rehabilitate New England's bare farms.

As poultry is the logical substitute for beef, its production in the thickly settled sections of New England, right at the consumer's door, extends the most alluring prospects for such as enter the business wisely. Eggs are not to be lost sight of, and no indifferent laying breed is to be considered. Eggs vary little in commercial worth in average markets. But when it comes to the carcass, any breed inferior in quality to the best you may have to compete with would be a serious handicap.

I raised the past season 200 Barred Rocks, and as they grew to roaster size I sold the cockerels to family trade. Three Rhode Island Red cockerels I sold among the rest, and I heard from each buyer later that they preferred my Rocks. The city markets can name a higher figure for the choicer grades; but in towns, to get and keep a desirable retail trade is all important, and warrants much care in the selection of a breed.

The term "general-purpose breed" may suggest the union of diverse traits at the cost of some sacrifice of quality; a condition which for good reasons does not apply to the Barred Rocks. This breed stands the very highest as a flesh producer, being dependable as a breeder, the chicks thriving under conditions where some special carcass breeds prove difficult to rear. So strong a hold has the golden-hued Rock upon New England tastes that no competition in white-fleshed breeds may be feared. And going below the surface, the Rock is so superior in quality as frequently to call forth remark upon the sweetness of its meat, which has happened occasionally in my own experience. The fact that the wholesale packers pay a bonus for Barred Rocks over any other breed is in itself suggestive, for that is the last place to look for sentiment to affect price. As to laying, I have found even June-hatched Rocks dependable Winter layers; and if not making so high an annual record as some, they can hold their own in actual receipts from eggs laid in the season of scarcity.

The American Poultry Association, which receives so many hard knocks for its work in giving distinguishing form and color to each distinct breed of fowls, has now in preparation a utility standard, which is expected to do a similar work in standardizing the dressed poultry and eggs output of all breeds. It is a safe prediction that the day is not so far distant when both eggs and dressed poultry may be ordered "sight unseen" with tolerable certainty as to what one is buying. Further, the age, fatness, and all points that go to make marketable quality, will come to be a matter of as careful grading as we now observe in packing fruit. The bonus of several cents per dozen commanded by Leghorn eggs in New York market is chiefly a matter of uniform product. No one is so rash as to suppose the Leghorn is more valuable than an egg of any other breed, but it so happens that this is the only breed the output of which as marketed is strictly uniform in every particular.

This utility standard will soon be published, and is anticipated to bring order out of chaos as to poultry products. In bygone days Winter apples were gathered and stored without regard to variety, and, as a child, I remember to have seen an old farmer digging his crop of peachblows, white, red and blue potatoes, with a beautiful uncertainty as to what color each successive hill would yield. But in the coming day of uniformity in poultry products these things will appear no more absurd than miscellaneous marketing of all sorts and conditions of produce. It is already imperative in the working up of a stable market for poultry that in place of mongrels one has that degree of uniformity and quality which is possible only with pure stock, and well-bred at that. For as different stocks of the same breed vary as to laying powers, so also will they differ in the value of their meat.

I will say in closing that opportunity is now extending the glad hand to those who would venture judiciously into the poultry field, especially in the thickly settled East. In order to be most economically conducted and most surely profitable it should be

carried on jointly with tilling the soil. Fruit-growing and gardening in connection with poultry makes a strong team. Chickens and the growing crops should occupy the land at the same time, with mutual benefit; but this calls for experience and good judgment. Don't be afraid that so many will go into poultry at once as to swamp the market. The increasing demand will take care of all the poultry and eggs that can be grown. The trite saying, "Plenty of room at the top," applies here. If you are wise and have something better than your neighbor, and especially if you cultivate the faculty of making the trade believe it, you can command the cream of the trade whatever the competition.

Massachusetts. FRED. W. PROCTOR.

STORING WATER IN A WELL.

"Umpire," page 1342, has had his problem solved, but the man with the well still has his. The experts have told him what not to do. I shall endeavor to tell him what I should do under the circumstances. We all know that the digging of a well is somewhat expensive, and if this man with the well could hit on some inexpensive scheme that would enable him to store his rain-water in the same old well he would be pleased. Were this problem mine I should put about eight or 10 inches of coarse, clean gravel in the bottom of the well. In this gravel, about a foot from the side of the well, so as not to interfere with the pump, I should stand upright a piece of 1½-inch iron pipe 22 inches long. I should cover the gravel with seven inches of cement. This would allow for three inches of pipe to stick into the gravel and two inches to extend above the cement bottom. Before putting down the cement it might be a good scheme to cover the gravel with old sacks, to prevent the cement from running down; at any rate, I should mix the cement somewhat stiff. Threads would have been cut on the upper end of the pipe before putting in and a vertical check valve screwed on. Be sure you do not get the valve on upside down.

This valve would open automatically when the water level was higher on the outside of the well, and close when the water was higher in the well. Water could flow in from the bottom, but could not flow out. If the well were filled from the surface during a dry time, or at any time, the valve would remain closed until the water in the well had been drawn down to a point below the water level on the outside, when the valve would open to allow the water to flow in from the bottom. A. J. H.

Schoharie, N. Y.

RESULTS FROM SUBSOILING.

Can you give me any information about the use of a subsoil plow? What kind of soil is benefited by its use, and what kind of soil does not need it? Of the different kinds of subsoil plows, which is considered the best? Also, does the benefit derived from subsoiling justify the expense? C. T.

Moravia, N. Y.

There is very little literature dealing with the subject of subsoiling. This means that experiments and the experience of farmers have not been such as to encourage the following of the question. The Nebraska Station, in Bulletin 54, gives the results of several years' experimentation, and indicates one type of soil that seems to be benefited, and one that seems to be harmed by subsoiling. The bulletin is summarized in the Experiment Station Record as follows:

"The results obtained at the Station on a loam containing alkali and underlaid by a compact subsoil showed that the subsoiling increased the yield in most cases, but when the season was very wet, Spring subsoiling failed to show any benefit. Subsoiling in Nebraska, where the subsoil was loose and porous, reduced the yield by about one-half. The results of subsoiling obtained by farmers throughout the State are reported. On clay subsoil 80 per cent. of the trials were favorable to the subsoiling, but on a loam subsoil only 23 per cent."

Four experiments by the Royal Swedish Agricultural Academy with vetches and oats, oats, and oats and barley, showed a gain in value of crop varying from $1.75 to $5.36 per acre. Most of the tests, however, are like those reported by the Idaho Station—"Tests of the effect of subsoiling on soil moisture gave inconclusive results."

There was much more discussion regarding the advantages of subsoiling 20 or 30 years ago than there is at the present time. Theoretically it would seem that certain soils should be much improved by being subsoiled, but in practice the benefit fails to become apparent. Not only do the crops immediately following fail to show much improvement, but it seems that the subsoils so treated very quickly settle back to their former compactness. The expense of subsoiling is very considerable, and it is doubtful if sufficient increase of yields may be expected to warrant it. Probably the same expense used in drainage will give better results. Possibly subsoiling immediately after draining will make the drainage more quickly and fully effective. Most implement makers put out a subsoil plow that is intended to follow the ordinary plow and stir the subsoil five to 10 inches deeper without bringing the subsoil to the surface. These plows are often found on well-equipped farms, but they are more used for loosening carrots and other deep-rooted plants for harvesting and for loosening the soil in ditch digging, than for regular subsoiling. J. L. STONE.

Cornell Exp. Station.

R. N.-Y.—We often receive statements from farmers who have tried subsoiling—usually with apparent gain. The best results are found on stiff clays where the subsoil is very hard and stiff. We understand that "subsoiling" means breaking up the lower soil without bringing it up or over.

"TRAPPING YANKEES."

Two or three years ago we spent the Winter in Texas. A great amount of land is laid off in that State in plots of various sizes, marked at the corners with conspicuous white stakes. We were riding out of Houston on the train one day, and had been passing for miles through unoccupied, plotted land. My wife turned to a man sitting near us and asked the reason for so many stakes set in squares. "They are traps to catch Yankees in," was the answer.

And the Yankees are caught by the thousand every year. There is good land in Texas, and it is a good State to live in, and some of the land is priced at what it is worth. But those "little-lander" propositions are sometimes put forward by land companies that make their money by exaggeration and misrepresentation. No one should buy one of those 'traps" without seeing it, and reading its performance, or that of similar land nearby, in the past tense. The agents speak mainly in the future tense, singing their song of what their traps "will do." Let the prospective purchaser break away from the agent and his cappers, and ask the neighbors there what they have raised and what have been their yields in past years. However, all I ask of a land-buyer is that he shall not buy what he has not seen.

An item in the paper the other day gave the winnings of a set of Florida land-pirates at over a million dollars out of a tract of swamp. There is good land in Florida and, no doubt, good "buys" there; but land bought "unsight, unseen," as boys in my time sometimes traded jack-knives, is always a bad "buy." This Winter I am in California. I have no word to say against it, or its developed or undeveloped land. But I would like to caution the unwary against the "Yankee traps" that are set widely and are cunningly baited. Coming up the coast road the other day, I noticed in a couple of instances where the tide-lands were staked out. In a diagram or blue-print those plots would show the same as tillable land. Let the Yankees beware! Land that they have been upon may prove to be less valuable than they suppose; but land which they know nothing about except what appears on paper might easily turn out to be a "trap." EDWIN TAYLOR.

A CONCRETE MANURE PIT.

I read with interest the questions about a manure pit by R. V. B., and answers by Chas. B. Wing, on page 1246. Would it not be practicable to build a small cement pit directly at end of gutter and outside of barn, and let the liquid manure run directly into pit, and pitch or shovel the solids into same pit? This for a small farmer who keeps three or four horses in one stable and three to six cows in another stable, who does not think it would pay to put in a carrier system, but does think it would pay to take the very best of care of what manure there is. I have thought of building a concrete pit at end of each stable, to store manure in and build a roof over each one, as I thought it would be too wet if left open. Why would not this be satisfactory if plenty of absorbents were used when there was too much liquid to handle, or water used on horse manure if it was too dry? I want two small manure pits, but I want to know how to build them right. A. R. H.

Buchanan, Mich.

In my barn things are arranged so that there is not a great deal of liquid manure not absorbed. There is some, but only quite a moderate amount. I feed enough shredded stover throughout the year so that frequently the manure is decidedly dry, and no liquid whatever, and at the most there will be only, probably, 50 pounds a day of liquid that is not absorbed. Where this was not the case, however, I think it would be practical enough to take care of it, as your correspondent suggests. In fact I think, in a way, that your correspondent has a mighty good idea. The piles of manure thrown through a little stable door, frequently right under the eaves, and also frequently on a hillside, which is the method used by nine-tenths of the farmers in many places over the country, is not only slovenly in appearance but decidedly wasteful, and it would not only be very much neater but more profitable as well, for even small farmers who only had two or three cows and as many horses, to take care of the manure as your correspondent suggests.

I buy most of the manure that is produced in our village, and am a little more interested in the subject on that account also. One firm that I buy from has two horses kept in the barn the year around, well-cared for, and they have a concrete box for the horse manure. This box is about 10 feet square and five feet deep. These two horses, with liberal bedding, fill it, I think, about once a month, and we haul it with two small loads or one very large load. This pit is a little of a joke, because it has no bottom to it, but horse manure is so dry that there is less leaching than with some other forms. I mention this pit only in order to give A. R. H. a little idea of what he would need in taking care of his horses, and I might say that if he has trouble with liquid in his cow pit, a few wheelbarrow loads of the horse manure makes an excellent absorbent.

The only thing that I find about the use of concrete around manure is, that it is necessary to have the concrete of good quality, and preferably coated with whitewash before using, the acids in the manure attacking the lime in the concrete, gravel, sand, etc., and will sometimes destroy the work in a few years' time. I had this happen on some underground cement work which was fairly soaked with liquids from manure, and in two years' time the cement was decidedly rotten. CHAS. B. WING.

Ohio.

APPLE CULTURE IN WISCONSIN.

Will you advise me what commercial varieties of apples are like the Ben Davis in their preference for heavy clay lands, which varieties prefer medium soil, and which light? Would the land have any effect on the scion if the scion happens to prefer different soil from the stock? The stock will be Hibernal. I expect to plant Wealthy, McIntosh, McMahon, and possibly King or Hibernal stock, and wish to know if 30x30 feet square is all right; also if there is any real advantage in planting by hexagonal method. Give a full discussion on the relation advantages for a young man of limited means going into the orchard business as to the best method of starting. Is it best to buy one in first-class condition or to buy one in fair condition, or is it best to plant one? Will it pay to plant one-year-old whips and the following season bud to selected buds, or is there nothing in the idea of selecting buds from heavy-bearing trees? Or, would you recommend planting first-class nursery stock in preference?

If Early Richmond and Montmorency cherries are given good attention from the start, how long may they be expected to live; same for plums? H. M. S.

Racine, Wis.

It is taken for granted that the intention is to plant or buy an orchard in Wisconsin. There are sections of that State, and also in Minnesota, where apples of the hardier varieties are grown successfully, and of the varieties mentioned, the Wealthy and McMahon are of this character. The Northwestern Greening, Yellow Transparent, Oldenburg (Duchess), Pewaukee and a number more are equally hardy, but the McIntosh is not quite as hardy, although it has endured severe Winters in many cases. Tompkins King is not a hardy variety, and should not be planted in Wisconsin. I do not believe that there are any varieties of the apple that flourish better in light or sandy than in clay land, but all kinds do best in loose clay or shaly loam that is well drained. I am not able to give lists of varieties that are especially suited to particular grades of soil that are called "light, medium and heavy." Any good soil for corn or any ordinary farm crop is usually suitable for apple orchards, provided the location is right. The hardiness of the stock has an influence on the ability of the tree to endure the climate, and the Virginia crab is used for this purpose as well as the Hibernal.

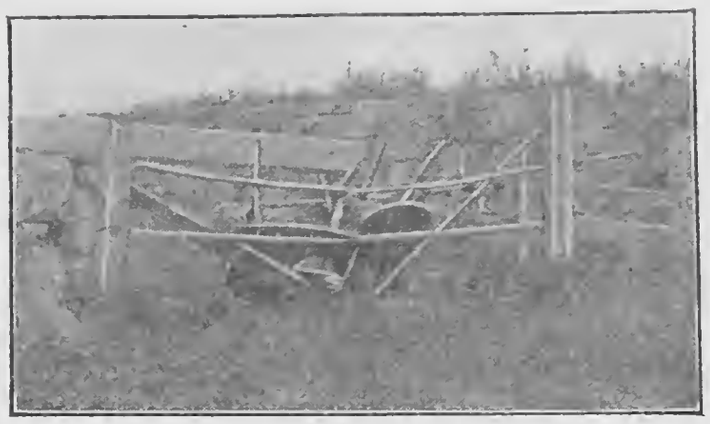
Regarding the comparative advantages of starting in the orchard business by planting or buying an orchard already planted, there are many things to consider. "A young man with limited means" can usually make a good orchard cheaper than he can buy one; but he might find a chance to buy one very low that had been well planned and for some reason had to be sold. But one in first-class condition would rarely be offered for sale at a bargain, and one that had been neglected, and yet not beyond quick recovery, might be very wisely bought and brought back into good condition at small expense. Here is where expert judgment of the best kind would be needed, and one just starting into the orchard business is not likely to have it. If such a thing is attempted the best advice possible should be secured and then followed.

Planting one-year-old apple trees and budding them the next year with buds taken from bearing trees would be no better than planting good nursery trees of the same varieties from any really reliable nursery and would cost more. Early Richmond and Montmorency cherry trees ought to live and bear well, if well cared for, until they are 30 years old; and the same is true of plum trees.

H. E. VAN DEMAN.

A PROFITABLE TURNIP CROP.

On page 1301 I notice that the farmers of Linwood community, in Leavenworth County, Kansas, are selling their turnips at $12 per acre. That seems to me a very small price if they have anything of a crop. The writer has sold this year from an acre of ground $55 worth of turnips, and has on hand 40 bushels that are altogether too large for commercial purposes. We had one weighing six pounds. A great many of them weigh 2½ to three pounds and over.



A Badge of Inefficiency. Fig. 11.

They are too large for selling, but are solid and good. We shall feed them to our cow this Winter. Our market has been two small county towns, from 1,500 to 5,000 population.

I have found turnips a valuable catch crop. They require very little work. They grow late in the season, when it is cool. The above patch I speak of was sown on the 4th of July. On the afternoon of the first of July we had one of the fiercest hailstorms that needs to visit any community. It rained hail by the bucketful, and in places ruined every green thing above ground, and tried hard to bark the trees. This patch was in sweet corn, and was ruined. We just ran the spring-tooth over the ground once, I sowed 15 cents worth of seed, and with a single horse brushed the ground lightly. This was all of the work, except harvesting and marketing them.

This acre of turnips was in a 10-acre field, and yielded enough income to pay the rent of the field. I pay cash rent. The remainder of the field was in oats and early potatoes, and was nearly completely ruined by the hail. I have also found out in other years that turnips are a good crop to raise. Last year I sold more than $60 worth, all raised in the cornfield as a companion crop. They grew mostly after the corn was cut up. I shall continue to raise them, as they bring in considerable money. This year we harvested some on December 6, and still have some in the field to get if the present cold spell moderates again. SAMUEL HEYMANN.

Huron Co., Ohio.

R. N.-Y.—The point is that these Kansas farmers had not tried a second or cover crop before. They found this $12 a clear gain in a section where most people had seldom heard of turnips as a profitable crop before. Of course the crop is worth more in an older settled country.

WHY NOT TACKLE CLOVER SEED?

Did you ever see a big table of results in clover seed growing? You've seen dozens or hundreds on wheat; a hundred pounds of phosphate made so much more wheat; plowing early or planting late made 221 pounds more or 136 pounds less. Tables on tables like that for wheat, and the same for corn, oats, barley and for clover as a hay crop. But where are we told about clover seed? Very little about how to raise the seed. The literature is mainly about how to tell the weed seeds in it.

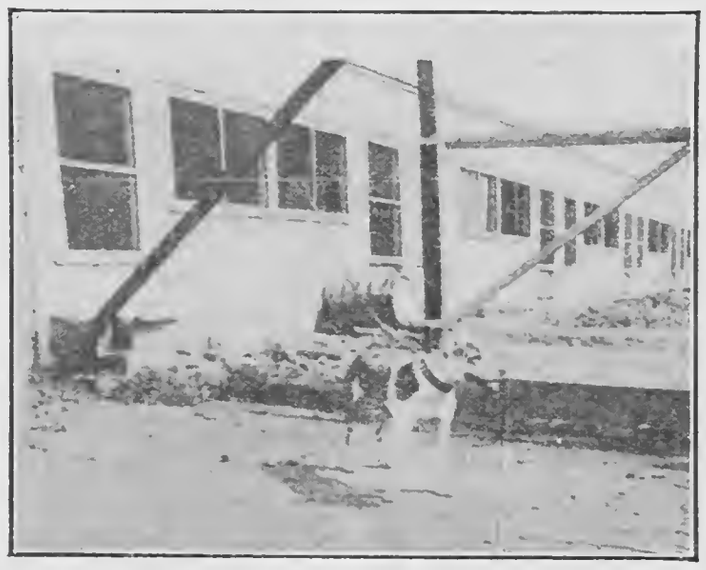
The Department of Agriculture and the various State institutions on the same line are supposed to exist to help the farmers. The R. N.-Y. has often pointed out how this help might work the other way. The bigger crops of grain the growers get the less the total money value; urbanites thus benefit from bumper crops rather than the people of the soil. Not so with clover seed, for the farmer is not only the producer of this crop; he is almost the sole consumer. If clover and other legume seeds could be produced more easily we could afford to keep more acres idle with soiling crops on them. We could get the same amount of salable grain from less land and without so much hiring to do. When everyone could raise most of his own seed there would not be so much scattering of weed seeds from one end of the country to the other. Only the cleaner stands would be thrashed. The back-breaking hoeing would be reduced and the tiller's comfort added to all around. It does not look fair to farmers to expend all the official energy teaching him how to grow cheaper grain for town people, and almost none on how to produce cheaper legume seed for himself. These farmers do not apply so much to cow peas and Soy beans. It is the small seeded and the Winter legumes that have been neglected.

Probably the stations will not undertake to grow Red clover seed, but there are thousands of other legumes, some very likely ones. More attention should be given to these and their seeding, and less to the grains. Department Bulletin No. 6 tells about legumes that will grow on acid soils, Hairy vetch, Soy beans, lupins and others. They seem to have the power of using the "unavailable" nitrogen. More work on this line ought to be done. It is fresh and interesting to see a plan of adapting the plant to the soil instead of laboriously carrying the soil to the plant. BEN. P. EDGERTON.

TENANT FARMING—THE LANDLORD'S SIDE

[The R. N.-Y. wishes to be known as a human document—giving freely the human side of farm life. This means an honest statement of the sorrows as well as the joys, the failures as well as the successes. Statements of this sort are in language which plain people can understand. There follows a personal statement from a landlord in Central Illinois. This is his point of view. If any tenant wants to give the other side we shall be glad to hear from him.]

I fortunately own four farms, which I rent for cash and grain rent for enough to keep the wolf from the door. Farm tenants call me hard to please as a rule. I do not ask more rent than they have to pay others. My buildings are in as good repair, also other improvements, as the owners who live on their land have. I would like to have all kinds of fruit on each place, sufficient for one or more families and some for sale. The fruit-growing trees, vines and shrubs have about disappeared, and how I would like to replace! When I saw a tenant wilfully break limbs on cherry trees to secure the fruit, stand on a ladder and with a long club punch and beat the



Better Than a Shotgun for Thieves. Fig. 12.

limbs of the plum and peach trees, too lazy to run a wagon under to enable him to gather from the ladder, I just concluded not to replant again. It seems to me to do so would be casting pearls before swine. I am past the three-score period of life, have been on hundreds of farms on either side of the river in the Mississippi Valley, across the country from coast to coast via Portland, Oregon and Maine. I make it a point never to let a tenant treat me better than I will him, or anyone else when it comes to doing the fair thing. No one better enjoys seeing well-tilled farms or good improvements, and I should be delighted to help my own tenants to have them, if they would only make an effort to take care of the places. I have enough outside income to pay half my living expenses. I do not want all the land that joins me, only one child to inherit, and sorry to say no good wife to enjoy the fruits of my toil and our early savings.

I have seen answers in print and heard verbal advice to such tales of woe. The advice is, look for a good tenant, rent for a term of years, so they will take more interest, etc., etc. Well, I have been looking for the *good* tenant for over 30 years, one whom I felt I dare risk binding myself up for more than one year. Tenants do not give security, as a rule, that they will keep and comply with their part of the contract, and a judgment is scarcely obtainable in court, and almost as hard to collect. True, a landlord can hold any product grown on the farm for rent due. There are so many things which a tenant or the owner living on a farm should do which the average tenant won't do. I was raised on a farm, and all my hopes, desires and interests are centered in farming. I think I know what a farmer can do or ought to do; how much the natural elements will interfere, just as well as the average tenant. So why should I bind myself up for more than one year at a time by putting a farm worth from $20,000 to $35,000 in the hands of a tenant who gives me no security that he will keep and perform his part of the contract? My word is as good as a tenant's. I do not want to sell my farms. I expect to rent so long as I live, and never want to change a tenant so long as we can get along. I feel sure I do not misstate when I say, the average tenant carelessly lets a place go down to equal five per cent of the rent he pays. So much damage is done unnecessarily.

I have had some tenants live on my places as long as seven years. If tenants will do what they agree to do, the chances are they need not move in 20 or more years. My heir will have no occasion to change them after I am gone.

TOP SOIL IN YARDS OR RUNS.

During each year we frequently have letters from farmers who ask us about the value of the surface soil found in barnyards or old chicken runs where flocks of poultry have been kept for a number of years. Many farmers appear to think that this soil must be of very great value as a fertilizer, worth scraping up and hauling away. In Arizona farmers have not yet come to any thorough use of manures, yet in localities near the towns and cities the truck growers are beginning to look about for plant food. In that country there are many old yards or corrals where sheep or cattle have been herded for a number of years. Some of these corrals are used as shearing pens for the sheep, and the theory is that the upper surface of soil in that rainless district ought to be valuable. Analyses have therefore been made. In one case such a yard was found on a well-drained or gravel soil. Even in that country of limited rainfall, most of the plant food had been washed out. Still this soil contained about 11 pounds of nitrogen to the ton, which is about the average of ordinary stable manure. Other yards or corrals were examined on heavier ground, where there was little chance for the water to soak down through the soil. In some cases the soil scraped up from the surface contained 30 to 35 pounds of nitrogen in a ton, which made it richer in this element than some of the brands of low-grade fertilizer put on the market. These yards had been used for herding sheep and goats, so that the soil was richer than would have been the case had cattle been kept there. One sample of the soil found in a goat corral actually contained 44 pounds of nitrogen, 36 of phosphoric acid, and 75 of potash, which gave a value of nearly $15 per ton, at the prices in which chemicals are sold in the Eastern States. This plant food is not yet needed for farm purposes in Arizona. Soils as rich as the last-named would be worth handling and working over by our Eastern manufacturers.

There is no doubt that the bottoms of ordinary barnyards, as well as the top soil in chicken runs, contained large quantities of plant food. The first fact is the best evidence we have of the value of a cement or water-tight bottom in the barnyard. A concrete covering, or hard clay pounded down solidly, will hold most of the plant food, which would otherwise escape in liquid form by drainage or overflow. With this firm water-tight bottom the yard can be scraped out with a scraper, and promote a great saving in the fertilizer bill. In the case of chicken yards it is well known that after a few years of constant use, these yards become foul, and the birds more and more affected by gapes, bowel diseases, and other troubles. This soil may be dug

Genuine Irish Cobbler Potato. Fig. 13.

out to a depth of eight inches or a foot, plowing up the yard and scraping. We have seen cases where this soil carted out and spread over grain or grass, or over a garden, gave wonderful results. As a rule, however, we think it more economical to plow up such yards and plant them directly to corn or garden crops. This is much less work, and rank growing crops like corn or cabbage will clean the soil, give heavy crops, and fit the place for poultry once more.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Mixing Lime and Manure.

Will you inform us what the result will be if, when loading a manure spreader with manure, a layer of manure and then a layer of burnt lime is loaded on the spreader and spread on a meadow at the rate of seven loads to the acre? I have tried wood asbes and they give great results. R. J. L.

Hannibal, N. Y.

We have never mixed lime with manure in the way mentioned, as such a mixture will liberate a considerable part of the nitrogen in the manure in the form of ammonia gas. This is also true of unleached ashes, because of the lime carried in the ashes. In case, however, a soil were deficient in potash, the application of ashes by the re-enforcing of the manure with that element might do enough good in that way to overcome the loss of nitrogen, but in such a case kainit would be the re-enforcing material indicated and not ashes. On the majority of soils, however, the deficient element is not potash but phosphorus, because of the fact that our system of agriculture has resulted in a steady depletion of our soils in this element, through the carrying off of phosphorus in the grains, in animal bones and in milk, and we are finding that manures re-enforced with phosphorus are producing a very much greater effect than those re-enforced with potash, for all Ohio soils with which we are acquainted, and probably the same holds good with respect to New York soils. The logical thing to do is to re-enforce the manure, under such conditions as your correspondent describes, with acid phosphate. Of course, if the manure were immediately plowed under, the lime might be an advantage, but if spread on the surface the addition of lime would undoubtedly cause a waste of ammonia.

Ohio Exp. Station. CHAS. E. THORNE.

Apples for Wisconsin.

Two years ago we lost 75 apple trees, so I am thinking about replanting in Spring. So many men have been here to sell trees that I do not know where to buy. One says buy Wisconsin stock, another says New York stock, for it is healthier. A nursery about 25 miles away says theirs are the only ones to buy, as they use what they call a whole-root graft, which should not rot or blight. What would you recommend for us here in Southeastern Wisconsin, and what varieties do you think best to plant?

Kansasville, Wis. J. C.

Wisconsin-grown apple trees are certainly all right for planting in Wisconsin if thrifty, well grown, true to name and free from scale and root gall. So are trees from New York, Missouri, Alabama, Indiana or any other State if they come up to these specifications. It is a matter of very slight importance where the tree is grown, but of the highest importance how it is grown. Runty, stunted trees or trees infested with root-gall are absolutely worthless and should never be accepted from the nurseryman, nor planted. While State lines should not cut much figure in business transactions, we rather like to buy from Wisconsin firms even though we know that they buy three-fourths or more of their trees outside the State, mostly from Indiana, New York and Iowa. The best apple tree for Wisconsin is a well-grown two-year-old, about three-quarter inch in diameter at base of trunk, four to six feet "over all" with three or four branches. This should be a "piece-root" grafted tree. The Wisconsin nurseryman who used the old "whole-root" argument is either very ignorant or a deliberate swindler. In Wisconsin, where root-killing is sometimes a serious factor we want trees on their own roots as soon as possible, and this is best accomplished by using a short piece root graft. It is quite possible to buy good apple trees in Wisconsin from reliable nurserymen.

The black soils of Racine County, are not well adapted to apple raising, and nothing more than a home orchard should be attempted, but on the clay ridges near Lake Michigan almost any kind may be grown that will thrive elsewhere in the United States or Canada. The selection of kinds will depend entirely on the needs of the planter. If for home use only a succession such as Tetofsky, Duchess, Wealthy, Fameuse, McIntosh, Tolman, Northwestern, Windsor, Salome and Spy. For market, plant only three or four kinds, preferably Wealthy, McMahan, Fameuse or McIntosh and Wolf River, the last named a splendid baking apple and a good seller. There is only one McIntosh, and it grows to perfection in Wisconsin. FREDCRICK CRANEFIELD.

A Home for the Hired Man.

Much complaint is heard nowadays about the inability of the farmer to secure and retain competent help, but the real reason for this condition is seldom touched upon. The average young man capable of filling satisfactorily the position of helper on a farm has much the same ambition that his employer once had, principal among which is the desire to have a home of his own. As a single man he has none, but must live under objectionable conditions in his employer's house. If he is working with the object of sometime owning a house he soon tires of these conditions and goes where he thinks he will in a shorter time be able to marry and live in his own house, or at least a rented house, which he can call a home of his own. The lure of the city has the effect of leading him on, but he drifts in time entirely away from all thought of the life and independence of a farmer until youth and perhaps middle age is passed, and he finds himself again longing for the farm that has passed out of his reach. When the farm owners wake up to the advantage of providing a house for the hired man and his wife and children, there will be less complaint of scarcity of good farm labor. F. M.

Delaware Co., Pa.

R. N.-Y.—Some farmers are already "awake" and provide all reasonable fixtures, yet they cannot always obtain desirable help.

Cement Floor for Barnyard.

I am debating whether it would pay to put a concrete floor on our barnyard (75x45 feet). I have a manure spreader and haul manure out whenever I can, but manure accumulates for several months during haymaking and harvest, and during seeding and corn cutting and husking. I know this is a big contract, but thought to gather the materials needed during spare time, have plenty of stones to bring to proper grade (grade can be considerably improved). I can get coal ashes (soft coal) and gravel for hauling, for very little cost. Then when I can arrange some way to get along without using barnyard (it is directly in front of bank barn 76x56) I plan to get help and cement and do the work. Would it pay? It would be a manure pit and I could drain liquid manure direct from stables into it. J. O.

Pennsylvania.

It will depend somewhat upon the slope of the yard and the character of the soil. If the soil is a hard clay which can be scraped into dish shape and then pounded down hard, there will not be much loss from leaching. On a lighter, open soil this loss would be considerable. We think this concrete bottom would surely pay.

SCAB ON PEARS.

I have about a dozen pear trees, Flemish Beauty, on my farm in Cattaraugus Co., N. Y., that bear well, but every year the fruit gets scabby and so hard that it cracks open, having three or four deep cracks in each, so it is worthless. Can you tell me a remedy to make these trees bear good pears? F. M.
Kentucky.

The trouble complained of is what is commonly termed scab. It affects the fruit of the apple and pear especially, and the Flemish Beauty is one of the most susceptible varieties known. But it is easy enough almost entirely to free the fruit from this disease by spraying with Bordeaux mixture or lime-sulphur, provided that work is begun in time and done properly. No hit and miss spraying will do it, but intelligent and faithful work will make the pears on the trees that have yielded worthless fruit in the past, clean and bright. There is no need to grow scabby pears when the means are at hand to produce good ones.

H. E. V. D.

SULPHURIC ACID ON THE FARM.

I understand the acid phosphate is made by treating the raw rock with sulphuric acid pound for pound, and that the acid phosphate is more recommended for treating manure to preserve the nitrogen. I can get the raw rock at $6 to $7 per ton. Is it possible or practical to get the acid and mix it myself? You had an article some time ago on sulphur as a fertilizer. I do not suppose mixing sulphur with raw rock would help any toward making the rock available, but wonder if there is any process I could (here on the farm) subject such a mixture to so that the rock would be made available. J. O.
Pennsylvania.

No, it will not pay you to use sulphuric acid on the farm. That is a process which should be left to manufacturers who have facilities for doing the work properly. Sulphuric acid is deadly stuff for a novice to handle. A single drop spattered into the eye may destroy the sight. Leave acid phosphate making to the manufacturers. The raw sulphur mixed with the ground phosphate rock would not help.

OIL STOVE FOR A HOT BED.

I have the following problem, which perhaps you can help me solve. I have a 6x12 hotbed covered with double sash. The pit is three feet deep. It is practically impossible for me to get suitable manure to heat it in the Spring. What can I do? I have had in mind the following: The pit is three feet deep. I would put in a bottom of sheet iron two feet from the bottom, and then use a one-burner wick oil stove to supply my heat from underneath. If I tried this wouldn't I have to have air holes underneath to supply fresh oxygen for the burner? This bed is on a slope, is banked in front, and it would easily be possible to make an opening in front to get at the burner. Or could I put the burner directly in the bed with the plants without trying to get underground heat?
Wells, Me. H. S. H.

This is an idea in hotbed heating that I have never heard of being tried out, at least not for the purpose of raising plants from seed. My many years' experience in the management of hotbeds, leads me to believe the plan would prove a failure and perhaps result in the destruction of the hotbed. I remember some years ago, I was carrying some geranium plants over Winter in the cold frame, depending upon mats and shutters to keep out frost. Sometime in January a severe cold snap set in, the mercury dropped to several degrees below zero. I knew the plants would surely be frozen, unless some additional protection was provided. The idea occurred to me to try a small oil stove which I happened to have at the time. Everything went along nicely during the day and up to midnight, when I presume from the oxygen being all consumed, the lamp began smoking. It soon filled with soot which took fire and, if the fire had not been discovered by a friend who resided nearby, there is no doubt that the cold frame and its contents would soon have been burned up. I fear you would meet with about the same results if you should attempt the heating of your hotbed with an oil stove. On the other hand, the plan would not be satisfactory (even if danger from fire could be eliminated) as not enough heat could be secured from a one-burner oil stove, placed either above or below the soil, to keep the temperature up to the required height. To be successful in the raising of plants from seed at that time of year requires bottom heat, and of much greater volume and intensity than could possibly be supplied by a small oil stove. If the stove was used above the seed bed, the air above would naturally be warmer to a certain extent, but the radiation would be too small in volume to affect the temperature of the soil to any appreciable extent. This is particularly true if the ground outside the frame is frozen, which it is apt to be at that time of year.

The following plan of arrangement of seed bed and heating would meet your requirements in a very satisfactory manner: Cut five pieces of 2x4 spruce or chestnut long enough to reach across the frame, and 10 pieces 2x4 20 inches long on which to rest the cross pieces, to which they should be toe-nailed and braced across the corner with 1x4 inch stuff nailed securely to the knee near the bottom, and to the bench six inches from the center. This will provide five benches or trusses about five feet nine inches long and two feet high. Place these trusses in the frame at equal distance apart, placing a brick under each knee, to prevent it from sinking in the ground and to preserve it from rotting. Make the benches as near level as possible. Now nail a six-inch board to the benches on each side of the frame. This will hold them in place and is the only bottom board that will need nailing. Then nail a six-inch board edgeways all around the inside of the frame. This can be nailed to the posts that support the walls of the frame, and, if not close enough together, a block the same thickness as the posts can be placed between the walls of the frame and board for additional support, where needed.

You now have a space underneath the benches 20 inches in the clear, presuming the bottom of the pit is level, but this is not clearance enough for safety. Take a spade and dig a trench 15 inches or so in width and two inches deep at the west end and 14 inches deep at the east end of the pit, and at equal distance from each side of the frame; this will give you a grade of one foot in 12. This trench is for the terra-cotta radiating pipe, which should be six or eight inches in diameter. At the west end the trench is extended far enough to allow a clearance of six inches between the vent pipe and the outside end of the frame, this pipe should be of terra-cotta and extend high enough in the air to give good draught. At the east end dig a pit four feet wide by five feet long, and deep enough to admit the installation of a cast iron heating stove, of the common type and about 18 inches in diameter. If one can be procured with the collar or pipe attachment on the side, the depth of the stove pit can be somewhat lessened. The stove should set deep enough so that the pipe collar will be on a level with the terra-cotta radiating pipe inside the pit. The sides of the stove pit should be walled with brick, or concrete for safety against fire. The roof of the stove pit should be high enough to ensure safety from fire.

Now set your stove in place and attach one joint of galvanized iron pipe, with a damper, run it into the terra-cotta pipe, and close the joint tightly with good mortar, continuing the joining of the terra cotta pipe, carefully plastering the points, until the whole line is completed. The tile should rest on bricks laid flat, as a certain per cent of radiation will be lost, if this tile comes in contact with the ground. The wood at both ends of the frame must be cut away sufficiently to eliminate all danger of fire, which should be at least 18 inches on the stove end and 12 inches at the opposite end, and as an extra precaution against fire a piece of old tin might be suspended under the seed bed, over the radiator pipe, especially the first few feet nearest the stove. Now you can finish laying the bottom in your seed bed. If the boards are the full length of the frame they will not need any nailing, just slip them in place, and put the soil in to a depth of five inches. All that end of the frame coming inside the stove pit should be cut out up to the seed bed, and a door fitted in, hung on hinges at the top, so it could be raised at any time to admit heat from the stove to enter, or to admit of going under the seed bed at any time to make repairs, if any should be necessary.

Big Profits from Alfalfa

Have you ever stopped to consider that by growing this wonderful forage crop you can make your land earn from $50.00 to $100.00 per acre. To successfully grow Alfalfa there must be nitrogen-gathering bacteria in the soil.

The Standard Inoculation

FARMOGERM

High-Bred Nitrogen-Gathering Bacteria

will supply, not only enough bactoria to benefit the Alfalfa crop, but enough to enrich the soil for several following crops of other kinds.

Culture of Rape.

What fertilization is required to grow a crop of rape? O. K.
Hartford, Conn.

Rape is one of the most useful forage crops available for swine feeding. Preferably it should be seeded early in the Spring in rows 24 inches apart, utilizing about six pounds of the Dwarf Essex variety of seed per acre. If it is not convenient to drill the seed in rows it can be broadcast, in which case it will require from six to 10 pounds of seed per acre. The animals should not be turned in the rape field until the plants are from nine to 11 inches high, and care should be exercised in keeping the animals out of the field when the ground is very wet or muddy, for their presence in the field during such time would be wasteful of the forage. At no time should the rape plants be grazed off closely to the ground, and therefore, animals should never be permitted to pasture the field too closely. The plants do much better and grow more rapidly in case they have some size. Some corn should be fed in addition to the rape if it is intended to fatten the animals, and brood sows, not suckling pigs can be maintained entirely on this crop if necessary. The crop is particularly useful for feeding growing animals, and furnishes most excellent succulence for brood sows suckling pigs. A very common practice in the corn belt is to seed the rape in the corn just prior to the last cultivation of the corn, and then just before heavy frosts turn the pigs in the cornfield, and let them harvest the corn as well as the rape. It is doubtful whether pigs weighing 125 pounds will fatten any more rapidly than under such conditions, and it is a useful and economical method of harvesting the corn and rape. A good fertilizer mixture to use for rape would be as follows: 200 pounds acid phosphate, 100 pounds muriate of potash, 75 pounds nitrate of soda, and if in addition a light coating of manure could be added, the crop will grow very vigorously. We have practiced with good results the seeding of a mixture of oats, Canada field peas, rape and Red clover, and have been able to have a green forage crop that would last during the entire season.

F. C. MINKLER.

Weight of an Acre.

What is the average weight of an acre? E. M. M.
Batavia, Ill.

Hilgard in his book on soils says that an acre (43,560 square feet) one foot deep will weigh about as follows: sand 4,000,000 pounds; loam 3,500,000; clay, 3,250,000; humus or garden land and woods earth about 3,000,000, and peaty lands about 2,500,000.

Importing Fruit Trees.

I am thinking of sending to England for some fruit trees in the Spring. They will weigh about 12 pounds. Have you any idea how much the freight would be, or would they come by express? Will the custom house send them to me after duty is paid, or shall I have to go to New York to get them? H. H. N.
Carmel, N. Y.

Some European nursery houses have representatives in this country. In that case the business can be done here and the buyer saved the annoyance of looking after transportation and custom house matters. If doing the business direct, it will be necessary first to get a permit from the U. S. Department of Agriculture, Washington, D. C. This is a comparatively recent ruling intended to keep out stock infested with insects or plant diseases. Tell them what you are to get and who from, and they will send you the proper documents. For a small shipment the simplest way is to let your express company do the business. No doubt this has a foreign department with connections at the place where the trees will be shipped. When they arrive in New York, the express company will send you a bill for charges and duty, and, when this is paid, will get them from the custom house and forward to your place. If all goes well, your shipment should be on the way within three or four days after it reaches New York, but sometimes there are complications. In one case the writer was delayed 10 days in getting such a shipment through the negligence of the express company in attending to the custom house business. However, since the advent of parcel post it is noted that the mills of the express companies grind more rapidly than in former times. The transportation cost of such a package would run from $1 to $3, depending on where shipped. If the bundle could be made small enough to go by parcel post, it would be delivered to your local post office, with the bill for custom charge.

HEN MANURE FOR ONIONS.

You say to make hen manure most useful for general farm crops mix with each 100 pounds 15 pounds phosphate and 10 of muriate of potash. I wish to put in three acres of onions next Spring grown from sets; the land has been well fed, Crimson clover and rye now standing six inches high. Can I grow onions with that or would you advise York manure? How many pounds of hen manure would you use to the acre? Would you put it on top after setting onions, or before setting or would you use it for something else? L. D.
Newport, N. J.

By "York manure" we suppose you mean New York stable manure. The clover and rye plowed under with hen manure ought to produce a good onion crop. We should plow the rye and clover deep and pack down with a roller. Have the hen manure crushed fine. You ought to use one ton of hen manure, 300 pounds acid phosphate and 200 of muriate to the acre. Broadcast the manure and chemicals after rolling and then work them well into the soil with a harrow. Then set the onions and cultivate them well.

Buckwheat as a Nurse-crop.

In reply to P. M. who asks for experience with buckwheat as a nurse crop for grass and clover; I will say that I have made a practice of sowing grass and clover with buckwheat for the past 15 years, and I seldom if ever fail to get a stand. The buckwheat springs up rapidly, and furnishes the necessary protection to the young plants; and comes off in time for the young grass to have considerable time to grow before freezing weather sets in. The buckwheat has the advantage over wheat, oats and other crops as a nurse crop, since it keeps down the weeds and the ground is left when the crop comes off with nothing but the buckwheat stubble and grass and young clover on the ground. Then again the soil is left loose and in ideal condition for the young crop to do its best. With me the buckwheat has been the most successful nurse crop that I have ever tried, and I usually get enough buckwheat to pay me well for preparing the soil, sowing it and gathering the crop, besides a nice, clean uniform stand of grass and clover. A. J. LEGG.
West Virginia.

We have the best success with buckwheat as a nurse crop for clover and all grain provided always the ground is rich enough to bring clover. V. H.
Shohola, Pa.

Here in New York buckwheat is sown about the first of July, and that clover does not get good enough start to hold. When the frost goes out in the Spring I prefer rye or oats. J. W.
Hamondsport, N. Y.

My experience finds buckwheat an excellent nurse crop to Alfalfa and Crimson clover. In the early Spring of 1909 I wanted to sow one acre of southern sloped hillside to Alfalfa, but fearing a drought and the hot Summer, made me somewhat undecided. However I resolved to sow the Alfalfa and try buckwheat for a nurse crop. I sowed the buckwheat with the drill (one-half bushel to acre) and the Alfalfa with the hand seeder, running over with the horse hayrake to cover Alfalfa seed. It was a great success, and after I cut the buckwheat the Alfalfa was so well started that it required a clipping in the latter part of August. I tried the same plan this year with Crimson clover. I had a piece of wheat stubble with no grass in it. I turned it, and on July 26 sowed it to buckwheat (one bushel to the acre) and Crimson clover for a cover crop. I waited with the clover for good weather conditions, and when all signs were right for rain I sowed the seed, but wind came and dispersed the clouds, and no rain came for two weeks. In this time much of the clover was seed sun-scalded, but where it found the least mositure it did well. In my estimation buckwheat is better than oats, as it is entirely free from an undergrowth, and gives all the room to the grass plants. I shall not hesitate to sow buckwheat as a nurse crop to all grasses. L. F. NICHOLS.
Pennsylvania.

Overland

$950

Completely Equipped. f. o. b. Toledo

1914—A Bumper Overland Year

FOUR years ago the Overland passed into the hands of its present owners. During this same time many other automobile manufacturers have come and gone—flared up and out. But our progress has not only been phenomenal, but strong and healthy. Each year our sales have increased by millions. In the last four years we have accomplished *more*, done a *larger* business and given the farmer *more* car for *less* money than any other automobile manufacturer in the world.

All this is a matter of record.

This is going to be our banner year. We are producing 50,000 cars, and the largest portion of this great output is going to the American farmer.

Farmer's Now Using 65,000 Overlands

The farmer consumes more automobiles and more Overlands than all the rest of the world put together. Today 65,000 Overlands are giving satisfactory service on American farms and ranches. And if ever an automobile must "deliver" it's on or around the farm.

One of our largest western distributors has contracted for 5,000 Overlands. This is significant and typical of the west. He would take *more* if we could supply them.

Like as not your nearest neighbor owns an Overland. Ask him. He'll tell you of its all around ability and economy.

We repeat, 1914 is going to be our bumper year. Never before has the farmer shown such keen appreciation of the Overland as he is doing right now. Never before has he so thoroughly realized that we are actually giving more car for less money than any other manufacturer in the business.

And why not?

Larger In Every Respect—But Lower In Price

Look at the car—read the big specifications—see the low price.

A wheel base as long as on most $1200 cars.

A motor as large and as powerful as the power plant in most $1200 cars.

A car as large, roomy and comfortable as most $1200 cars.

Tires as large as you find on the average $1200 car.

Electric lights—even under the dash—deep upholstery, an unusually heavy frame, a large steering wheel, Timken and Hyatt bearings, three-quarter floating rear axle, a jeweled Stewart Speedometer—all the same identical features you find on the average $1200 car.

The body is designed with graceful cowl dash and flush U doors with concealed hinges. Everything right up-to-date.

The car is finished in that magnificent dark Brewster green, trimmed with polished nickel and aluminum. It could not be made prettier. It could not be made more striking if it cost $3000.

Our price $950—Others Must Charge $1200

To duplicate this car any other factory would have to charge you $1200 and more. Our price $950—because we are the largest producers and can effect the greatest number of manufacturing economies. And you save the difference.

This is the car everyone is demanding. See it before you buy. See how economical it is on gas, oil and tires.

Get in touch with the nearest Overland dealer. There is one near you.

Write us for a handsome 1914 catalogue. Please address Dept. 127

EVENTS OF THE WEEK.

DOMESTIC.—At Red Jacket, Mich., December 24, while copper mine strikers and their families were holding a Christmas festival in Italian Hall, some one started an alarm of fire. There was no fire, but in the panic that ensued 72 persons were crushed to death; 58 were children.

A five weeks' rat hunt in Union Township, Ohio, ended Dec. 24, when the 213 men and boys engaged in the contest produced 10,336 rat tails, which were counted by the judges. The losers in the contest gave a dinner for the winners. One of the most remarkable figures in the slaughter was a small rat terrier owned by J. M. Hartman. More than two thousand tails were from rodents killed by the terrier, which made a record of thirty rats in one shock of corn. Another township hunt is on, and it is believed that when the series of contests has ended 50,000 rats will have been killed in Hancock County.

A violent gale swept the Atlantic seaboard Dec. 25, attaining along the New Jersey coast a velocity of 122 miles an hour. With the ocean lashed into mountainous seas, the bulkheads at Seabright were levelled, allowing the waves full play in their sweep over the Summer colony. Damage of more than $1,000,000 was done by the storm, in some cases entire houses being lifted from their foundations and carried bodily out to sea. Roadways were torn up, railroad tracks undermined, shipping demoralized and many towns along the coast were cut off from communication with the rest of the world. Ten men, the crews of two barges, were drowned when their vessels were swept on the bar near the Forked River life saving station, below Barnegat.

Political contributions from New York State canal employees amounting to $3,150 in 1912 and $2,600 in 1911 were sent to Arthur A. McLean, the treasurer of the Democratic State committee, by Walter G. Robinson of Schenectady, who is the superintendent of the eastern division of the State canal system extending from Albany to Utica and of the Champlain Canal. These contributions were received from about 500 employees according to recent investigation. In one year Mr. Robinson took the money to the Democratic State headquarters in New York city and in the other year he sent it by American Express. Harry Bogue, the Republican clerk to Owen Kearney, former canal section superintendent at Cohoes, and H. M. Hulsapple, a Republican of Watervliet, a special agent on the canals stationed at Schenectady, each of whom has held his position for the last 15 or 18 years, declared that during all that time under the Republican as well as the recent Democratic State administrations the canal employees were assessed for campaign purposes and the money was collected and forwarded to the State committee representing the party in power every year.

An expedition of the Royal Northwest Mounted Police has left Dawson, Alaska, for Fort MacPherson and Herschel Island, in the Arctic Ocean northwest of the mouth of the Mackenzie River. Part of the expedition will return at once after seeking from Eskimos, whalers and traders all possible information regarding Explorer Stefansson's expedition. Another police expedition from Herschel Island will meet the Dawson party at Fort MacPherson. If the Herschel Island party brings any definite news of the Stefansson party the Dawson expedition will hasten back from Fort MacPherson. The Dawson party has orders to obtain all possible news regarding Stefansson's whereabouts and hurry it to some point where it may be telegraphed to Ottawa. Sergt. Dempster, veteran of many other expeditions across the Rocky Mountains to Herschel Island, will command the Dawson party. It was Dempster who found the bodies of the Fitzgerald expedition three years ago. Corporal Hacking and four Indians will complete the party.

Fire destroyed six of the hangars on the grounds of the Hempstead Plains Aviation Company at Hempstead, L. I., Dec. 29. The loss was $29,000. Those who suffered the greatest loss were Frederick C. Hild and Edward Marshonett, who are incorporated as the American Supply Company. Some of the aviators in saving machines were severely burned.

The announcement that radium-bearing deposits have been found near Mauch Chunk, Pa., has created excitement in that section. Farmers and others owning land between Tamaqua and Mauch Chunk are busy conducting examinations of the strata. The alleged carntite or radium bearing deposits were found along the right of way of the Eastern Pennsylvania Railroad, owned by the Lehigh Coal and Navigation Company. Mining men say that if carnotite exists in this section it should be found all over the southern anthracite region, as the formation is identical. Secretary of the Interior Lane asked Congress Dec. 29 to pass a law which will give the Government control of all radium bearing ores found in public lands. Dr. James Douglas of New York, who controls concessions in radium bearing ore deposits, thought Secretary Lane's plan ambitious, but hoped for its success.

W. M. Barrett, president of the Adams Express Company, said Dec. 29, the company lost 25 per cent of its business in the last year because of the parcel post. The extension of the parcel post weight limit on January 1 still further would hit the express companies, he said. In addition, the 15 per cent decrease in express rates, to take effect then, as ordered by the Interstate Commerce Commission, will make still further inroads in the express company business. The express companies, Mr. Barrett says, have accepted the ruling of the Interstate Commerce Commission as inevitable, and they will now make retrenchments to show profits. For the year ended June 30, he said, the deficit in the Adams company was $89,872. This being the case, it is suggested that the $12 yearly dividend probably will be cut next year.

Montreal, Canada, already facing a water famine, was obliged Dec. 29, to conquer a fire to save a section of the city from destruction. To this end water was brought by fire hose from the St. Lawrence River, a mile away from the heart of the threatened district. There was but one stream besides this one available to fight the flames, as the city hydrants were all but useless owing to a break in the main water conduit on Christmas night. Two three-story buildings and 60 automobiles were destroyed while the firemen were devoting their efforts successfully to preventing the flames from reaching a 2,000-gallon tank of gasoline. The estimated property loss was nearly $300,000.

Ex-Controller Edward M. Grout and James T. Ashley were indicted by the Kings County, N. Y., grand jury Dec. 29 for perjury committed while president and cashier, respectively, of the Union Bank, now defunct. The men were indicted for misdemeanors on practically the same allegations a couple of years ago in the administration of District Attorney John F. Clark. These indictments are still pending. The charges are that Grout and Ashley wilfully made and swore to a false report as to the assets of the bank in April, 1910. Although the accusations were identical, separate indictments were found against the ex-officials. Under the 1911 indictment Grout and Ashley were charged with making a false report, and the most serious allegations in the Grout indictment were stricken out by Justice Marean. The recent indictments accuse Grout and Ashley of perjury. According to the indictments, the false statement made it appear that the resources of the bank totalled $7,165,201.82, when the total in fact was only $4,924,555.28; also the statement made it appear that the bank had loans and discounts, part of its resources, amounting to $4,954,163.52, whereas the right amount was $2,955,486.72.

W. L. Moyer, former chairman of the board of directors of the American Union Trust Company of Kansas City, Mo., was arrested at Chicago, Dec. 30, charged with having used the mails to defraud. He was arraigned before United States Commissioner Mason and his bond was fixed at $5,000. He is accused of promoting a $1,000,000 company, the actual capital of which is alleged to have been only a few thousand dollars. The Government charges that J. C. McDowell of Kansas City paid for $350,000 worth of the stock and that J. Ogden Armour was a large subscriber. Mr. Moyer was vice-president of the La Salle Street National Bank, now a State organization, for four months shortly after the bank, which was founded by William Lorimer, had begun the acceptance of deposits. He never was associated with the La Salle Street Trust and Savings Bank, the State company, according to officials.

FARM AND GARDEN.—A fatal case of anthrax, a highly contagious and fatal disease among cattle, has been reported at Binghamton, N. Y. The victim was C. J. Banta, a prominent farmer. The source of the anthrax infection is unknown, but is supposed to have come from an animal he was skinning. It is probable the State Department of Agriculture will order a quarantine until the source of the infection is located.

The Secretary of Agriculture announced, Dec. 27, the appointment of the following committee "to conduct a general inquiry into the various factors which have brought about the present unsatisfactory conditions with respect to meat production in the United States, especially in reference to beef, with a view to suggesting possible methods for improvement." Dr. B. T. Galloway, Assistant Secretary of Agriculture, chairman; Dr. H. J. Waters, president of the Kansas State Agricultural College; Professor C. F. Curtiss, dean and director of the Iowa State College; Professor H. W. Mumford, professor of animal husbandry, University of Illinois; Dr. A. D. Melvin, chief of the Bureau of Animal Industry, Department of Agriculture, and Dr. T. N. Carver, director of the Rural Organization Service, Department of Agriculture. The work of the committee will centre largely on the study of economic questions involved in the production, transportation, slaughter and marketing of meat. As the first step the committee will investigate carefully the changes within the last two or three decades which have increased cost of production and the centralizing of the meat industry. Among the important considerations to be gone into will be the taking up of the public lands, the effect of the capacity of the range, especially on the remaining public lands, and forest reserves, with a view to suggesting changes in the laws to make the public lands of greater use in cattle raising. The committee also will give special attention to the economic changes in meat production and distribution brought about through the centralizing of slaughtering and meat preparations in large packing establishments and the changes in transportation and similar matters which have resulted from this centralization and other causes. The economic possibility of communal and community effort in cattle raising and the advantages of establishing local or municipal abattoirs will also be investigated.

Inspectors of the State Department of Agriculture began Dec. 30 to check the overfeeding of live poultry just before it is unloaded and sold to consumers in New York city. For a dozen or more years poor families, who consume most of New York's live poultry, have paid on an average of $2,000,000 a year for sand and gravel in the crops of live poultry. Three arrests were made Dec. 30 at the Baltimore and Ohio Railroad terminal, at Twenty-sixth street, and others are likely to follow. Those arrested were William Goebel of Pleasanton, Kan.; E. Willcock, Berryville, Ark., and Louis Levy, 214 Division avenue, Brooklyn. Each was held in $300 bail for trial. The three men were charged with cruelty to animals and with overfeeding poultry with coal, sand and gravel. The S. P. C. A. about six months ago investigated the matter, but no action was taken. Now the evil will be attacked by the State Agricultural Department and the Federal authorities are interested, as some of the unloading is done in Jersey City.

FREIGHT SERVICE AT DANSVILLE, N. Y.

Nurserymen at Dansville, N. Y., are up in arms against the Erie Railroad for poor freight service. They appealed to the Public Service Commission and a great meeting was the result. The local paper gives this account:

"The foundation for all this demonstration lies in the fact that our nurserymen have grown sick and tired of the rotten service they have received for years, at the hands of the Erie Railroad, in the matter of transporting their nursery stock. Shipments that should have reached their destination, and been planted in the orchards of their customer within 48 hours after they left Dansville, have been delayed for weeks, and frequently until it was too late to plant them. This thing has been going on so long that our nurserymen were well-nigh discouraged. They are paying a force of high-priced help to prepare these trees for prompt shipment, and then to have them held up because of wholly inadequate railroad facilities was too much of a strain, so they appealed to the P. S. C., for redress.

"This meeting was productive of great good. The Erie officials acknowledged that the trouble was at their end of the Rochester division, as the D. and M. handled this end of the business promptly. The Erie folks promised that there should be no more trouble, as they would put on a force sufficient to handle all that came, promptly and carefully."

COMING FARMERS' MEETINGS.

West Virginia College of Agriculture, Morgantown, Farmers Short Courses, January 6-13; Agricultural Associations' meetings, January 13-16.

Peninsula Horticultural Society, annual Winter meeting, Easton, Md., January 13-15.

Massachusetts Fruit Growers' Association, convention and trade exhibit, Springfield, Mass., January 15-17.

New York State Agricultural Society annual meeting and convention, Albany, N. Y., January 20-21.

Vermont State Poultry Association, seventeenth exhibition, St. Alban's, Vt., January 20-22.

Connecticut State Dairymen's Association, Hartford, Conn., January 20-22.

Ohio State Horticultural Society, annual meeting, Cleveland, O., January 20-23, in connection with the Fifth Annual Ohio State apple show.

Virginia State Horticultural Society, annual meeting, Richmond, Va., January 21-23.

Annual Corn Show, Pennsylvania Live Stock Breeders' Association, Pennsylvania Dairy Union, Pennsylvania Horticultural Association, York, Pa., third week in January.

New York State School of Agriculture, Alfred, N. Y., short course in agriculture beginning January 26; Farmers' Week, February 23-26.

Forty-first annual meeting, New Jersey State Board of Agriculture, Trenton, N. J., January 29-30.

Farmers' Week, State School of Agriculture, Canton, N. Y., January 26-31.

Ohio Corn Improvement Association, Mansfield, O., January 27-30.

Western New York Horticultural Society, Rochester, N. Y., January 28-29-30.

Farmers' Week, Ohio State University, Columbus, Ohio, February 2-6.

Sixth National Corn Exhibition, State Fair Ground, Dallas, Texas, February 10-24.

Granite State Dairymen's Association, Concord, N. H., February 12.

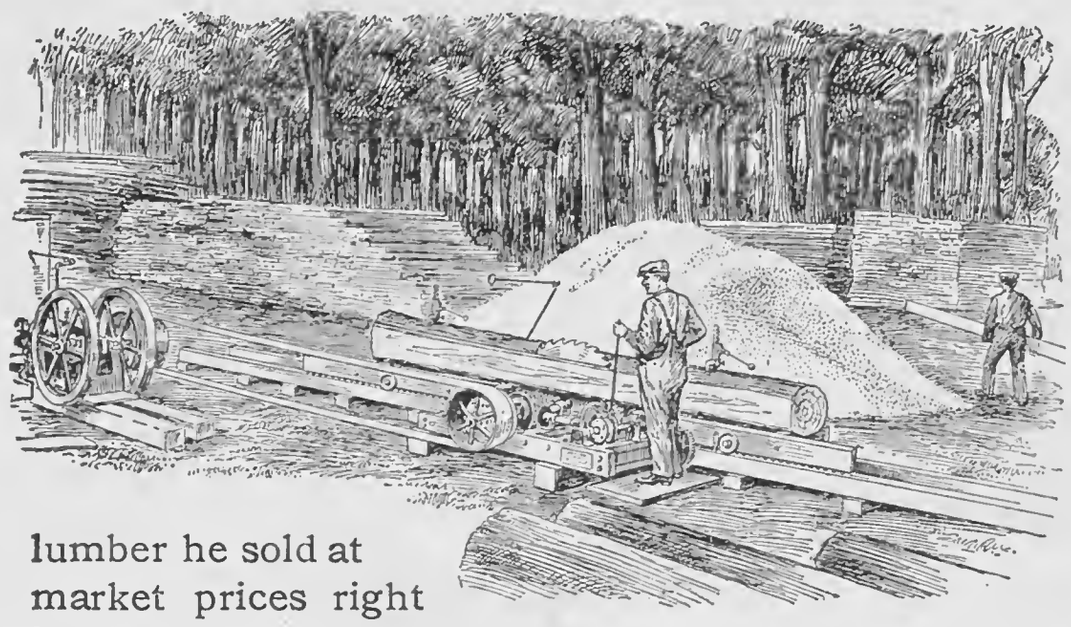
Massachusetts Agricultural College, Amherst, ten-weeks' Winter course, January 6-March 13.

Thirty-ninth annual meeting of the American Association of Nurserymen, Cleveland, O., June 24-26.

A STORY about making money

A FARMER had a wood lot that he had used only as a source of firewood. As no saw mill man had ever been around to buy the trees to saw into lumber, this farmer had been for a long time burning up good money because he didn't know that he could make lumber money from those trees of his. But one day he saw an advertisement of the "American" Saw Mill and sent for a booklet on "Making Money Off the Wood Lot." He learned from this book that his trees were worth a whole lot more as lumber than as cord-wood, and that he himself could, with an "American" Mill and his farm engine and farm help, make (at a few dollars per thousand) lumber that would easily bring him from $25 to $40 per thousand feet, according to the kind of wood he had. He found that even the sawdust was worth money and that he'd have plenty of fire-wood from the tops and slabs. Looking into things a little, he learned that he could saw the maximum amount of lumber per horse-power with an "American" Mill and that as no experience was needed, he could run it himself.

So this farmer bought an "American" Mill, belted it to his engine, cut and piled his logs; and he and the boys put in their time after harvest sawing out a lumber crop. Some of this lumber he kept for himself, for a big new barn he decided to put up. For he'd needed a new barn for a long time, but thought he couldn't afford it with lumber prices so high. But with his "American" he got all the lumber he needed, and just the sizes he needed, at the mere cost of making it. And the rest of the lumber he sold at market prices right in his own neighborhood.



At the end of the year the farmer found that his work had more than paid for his mill, and he had a first-class mill on hand ready for another year's work. Of course the neighbors heard about what he had been doing and began to think about making money off their own wood lots. So he went to them and made a deal to saw their timber into lumber during the next fall and winter. In some cases he agreed to do this on shares and in others charged so much per thousand feet sawed. He found the light, sturdy, portable "American" Mill just the machine for the custom sawing.

The upshot of it all was that this farmer found himself, after a while, with a good paying lumbering business that he could run at times when the farm didn't need him. He kept his engine and his teams busy the year 'round and made money all the time, instead of only when his crops were sold. A little later he added an "Up-To-Date" Shingle machine for making shingles and lath, box boards and crate slats and fence pickets. And he got a "Clipper" Wood Saw to cut up the slabs and tops into cord-wood lengths. For he had learned that any machine made by the American Saw Mill Machinery Company is a money-maker for the man who owns it.

WHAT this farmer did any farmer who has a wood lot can do. And even if you haven't a grove of your own, you can build up a custom sawing business with those in your neighborhood who have timber. Hundreds and hundreds of farmers all over the country are making money with "American" Saw Mills. Right now is the time for you to look into this farm lumbering business and order your "American" Mill. We can make prompt delivery and you can get busy at once. Don't wait till next year. Make this winter a harvest time. Keep the teams and wagons and engine earning money through the winter. Fill out the coupon now and mail it today.

TAKING CARE OF PEANUTS.

I have just read the suggestions of K. A. L., page 1351, on caring for peanuts, and as I have been and still am a peanut farmer in a small way I wish to say that while the method he describes might do where only a very small quantity is grown, it would be impossible where they are grown in large quantities, and I feel sure would not be the best even for a very small crop. All through the peanut belt, after loosening the plants by running under them with a small plow having a sharp shear but no mold board, the plants are shaken free from dirt and thrown in small piles; about a good forkful in a pile. Then at suitable distances along the rows of piles, stakes about six feet high are set in holes punched with a crowbar. Cleats are nailed across the stakes eight or 10 inches from the ground, and the peanuts are shocked around the stakes with the nuts next to the pole and the tops out. These shocks are topped out with grass to shed the rains, and are allowed to stand until both vines and nuts are thoroughly cured, which will usually be in about three weeks; although if the shocks are properly built they may, and often do stand for three months without injury.

The large kinds of nuts such as are sold from peanut stands in the cities must be thrashed from the vines by a special machine called a peanut picker, but the little Spanish peanuts may be thrashed with an ordinary grain thrasher equipped with a special cylinder having a slower motion and fewer teeth than the one used in thrashing grains. On the large farms where often several hundred acres are grown, a machine somewhat like a potato digger is used for lifting the plants from the soil and shaking out the dirt. The vines after the nuts are thrashed make a hay almost equal to Alfalfa. Where one only raises a few peanuts for home use they may of course be picked from the vines by hand after being cured in shocks as described above, but be sure to give the vines to the family cow and note the increase in milk.

JOHN B. LEWIS.

Brunswick County, Va.

HUSKING CORN WITH MACHINE.

We have husked corn by machine for the last 10 years. There are two methods followed in husking. The first is to employ a large machine and change work with the neighbors as in thrashing. These machines husk from 1,000 to 1,200 bushels of ears of corn per day, or 500 to 600 bushels of shelled corn, and charge five cents per bushel for machine and three hands to run it, the farmer paying for all other help. The second plan is for a farmer, or two or three together, to own a small machine and gasoline engine and do their own husking. This is probably the cheapest way, as two men can go to the field and load a couple of wagons, drive in and husk without other help. The fodder is always cut or shredded, and put into mows, and so well do we like this for feed that we sometimes shred the bundle fodder from the hand husking. Husking with a machine is no cheaper than husking by hand if we can get the help to do it that way. The advantages are the rapidity with which the work is done, and the advantage of having the shredded fodder put in mow in less than half the space, and often on top of hay mows, where putting bundle fodder would be very hard work. For feeding in mangers it is a much more convenient feed, and whatever is not eaten is one of the best possible absorbents as bedding for the stock and leaves the manure in very much better shape for handling than with long stalks to try the patience of the farm help. While stock will not eat all the fodder when shredded, as some claim, it will feed farther than the same fodder not shredded. As to its keeping qualities, the corn should not be husked until the fodder is well cured, in central Ohio usually not before the first of November; then if care is taken not to husk when there is rain or snow on the shocks, there should be no trouble. Keep the mow level instead of allowing it to form a larger heap at end of blower, and roll down the sides. When it seems desirable to husk before the fodder is in good condition, placing alternate layers of straw and fodder is the right thing. We have done this a number of times, keeping the fodder nicely and making the straw more palatable by absorbing some of the juices of the fodder. Our plan is to husk by hand until we think the fodder is safe, and then finish with the machine. Quite cold weather is all right for machine husking, as there is plenty of exercise in hauling and feeding to the machine. If the corn is cut by hand we do not tie in bundles, but with one man on a flat-topped hay-rack and another to hand to him a load is soon put on. Beginning at one end of rack fill as high as you want the load, so that the loader may stand on floor of rack until load is nearly all on. He then stands on floor of rack and hands to the man at the machine. I do not hesitate to say that machine husking is all right. HORATIO MARKLEY.

Ohio.

NOTES AND COMMENTS.

I would suggest to Mr. Gleason (page 1374) that no agricultural college claims to send out experienced farmers, but young men prepared to profit more rapidly by experience on the farm than they would without the scientific education. No medical college turns out a physician full-fledged; he needs the hospital practice, and the lawyer graduate will not get important cases till he has proved his ability. Education for any profession is simply fitting a man to find out what he should know, to know where to get it in every difficulty. Much of the experience of the uneducated practical man is useless from his erroneous interpretation of facts in his experience. He sees cheat heading out in his Winter grain, and accepts the popular idea that the wheat has turned to cheat, while the educated man who has made a study of plant life knows that the cheat came from cheat seed. The college graduate is rid of all the old superstitions, and when he goes on the farm to acquire the practical experience, he will continue to be a student, and will not stand still or run in the old ruts. The farmer with the educated son has a fine chance to make a good farmer to follow him, if he and the son have good common sense. That man on page 1375, who has struggled with that piece of muck land without success, is a good example of the experienced man without the training the college education would have given him, for the college graduate would have known at once that the needs of that land after drainage, were lime and potash, and not stable manure.

THE DASHEEN.—I grew some of these the past Summer, but unfortunately they were planted in a dry sandy soil, and the weather was hot and dry, so that the crop did not amount to much in size of tubers. But I have more than I planted, and will try to give them a better place the coming Spring. The only difference I can see between them and the common Caladium esculentum is that their rootlets are white, while those of the Caladium are pink. In top growth they look exactly alike, and the tubers of the Caladium (Colocasia) grow larger here than those of the dasheen, and both are probably good eating. W. F. MASSEY.

Peat for Fuel.

How do the Vermont people burn muck from a swamp? I have four acres, and would like to know more about it for fuel. J. D.

Eastport, Me.

The Vermont Experiment Station at Burlington has issued a bulletin on muck and peat, which will tell you all about it. In former years a few Vermont farmers used peat as fuel, but this use was never very large.

DIBBLE'S Farm Seed CATALOG for 1914

is now ready for distribution; the handsomest, most practical and complete strictly Farm Seed Catalog published in this country, containing a full-page article written by our Mr. Edward F. Dibble, entitled "The Plain Truth About the 1914 Farm Seed Situation."

Some farm seeds are in heavy supply and much cheaper than in years while others are extremely short and not enough to go around. You should get the facts at once so as to be able to buy intelligently.

Dibble's Catalog is different from others, every word is written by a practical Farmer and Seedgrower. The descriptions are accurate, absolutely correct and free from exaggeration, bombast and extravagant claims.

WE ARE HEADQUARTERS

FOR SEED POTATOES, over 60,000 bushels in store, 32 varieties, newest and best early, intermediate and late.

FOR SEED CORN over 10,000 bushels, half a dozen of varieties of the highest possible quality, flint and dent. Sold on a money-back-if-you-want-it guarantee.

FOR SEED OATS, the choicest, whitest and heaviest grain ever grown on American soil, weight 40-45 lbs. per measured bushel.

FOR ALFALFA, CLOVER AND TIMOTHY SEED, celebrated D. B. Brand, 99.50% pure or better, the highest grade obtainable. Sold on approval, subject to your test.

In writing, mention the number of acres you are farming and we will send you, with the Catalog, 10 samples of Dibble's Northern grown Farm Seeds for testing absolutely FREE. A postal will do.

Address EDWARD F. DIBBLE SEEDGROWER, Honeoye Falls, N. Y., Box B

Over 1600 acres in the Dibble Farms

Harris Cabbage Seed

Many large growers have been using Harris' Cabbage seed for years and have made lots of money. A number report that their crops this fall brought them over $300 per acre. The important point is to get the right seed.

It is the same with other crops—the seeds must be of the very best.

HARRIS SEEDS are raised with the greatest care, many of them on our farms, are of the highest possible quality, and are sold at wholesale prices.

Seed corn, improved varieties of oats, potatoes and all other seeds. CATALOG FREE. If you grow vegetables for market, ask for "Market Gardener's Wholesale Price-List" also. Ask for samples of new oats and "Gold Nugget" corn—they will interest you.

FARM ENGINEERING.

Filling Floor Cracks and Holes.

Will you give a recipe for filling up the niches in a wood floor? We live in an old house and it is very draughty. There are cracks in the floor half an inch wide. J. W. S.

Westboro, Mass.

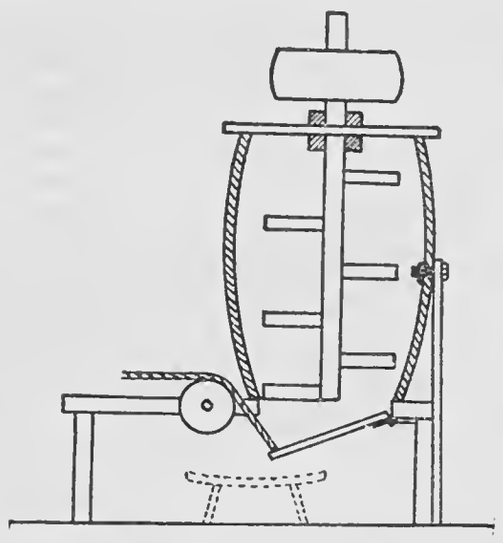
At any paint shop you can get prepared crack fillers very cheaply. It is somewhat of a question whether or not it would be worth your while buying the separate ingredients and mixing them up. Better see what you can do at the paint shop first. A mixture of concrete, using sawdust in place of stone, is the cheapest thing I can think of. It will prevent the drafts of cold air coming through but won't look very well. Another cheap and very satisfactory filler which can be prepared, varnished, etc., is made by mixing up a good flour paste of proportions, say, three pints of water, half a pound of flour and about three teaspoonfuls of alum. This should be thoroughly mixed together with care and boiled until pasty and smooth. Then thoroughly mix in with the paste enough torn-up newspapers to make a putty-like mixture. Fill the cracks tightly and the putty will harden in a short time. R. P. C.

A Concrete Mixer.

I have been trying to study out how to make a concrete cement mixer, to be operated by a two-horse gas engine, and would like to know if any of your readers have successfully used one. If they have, would you describe it? F. M. H.

Rawson, O.

There are five types of concrete mixers which might be used for any job. Each one has its own desirable features as well as more or less undesirable ones. You may have what is known as a batch mixer, in which you shovel the proper proportions of cement, sand and stone to make a certain quantity of concrete.



HOMEMADE CONCRETE MIXER.

This machine is then started, the mixture is well stirred and may then be emptied out by tilting the machine or by simply opening a slide and allowing it to fall out. The first is a tilting batch mixer, the second is a non-tilting batch mixer. Then there are the continuous mixers in which you place the materials and they are mixed by an endless screw which shoves them forward at the same time and out of the machine. These are also of two kinds. In one kind you may dump all the material you have in hoppers and they are correctly proportioned in being fed to the mixer. In the second kind, you must properly proportion the materials yourself.

The third class are known as gravity mixers. In this class of mixers, the materials are deposited within the machine and near the top. They then flow by gravity through the machine and out at the bottom. In one form the machine is merely a sloping trough which has numerous pegs extending into it from the bottom and sides. These mix up the mass as it flows by. In another kind, the materials are dropped from one bucket into another, then into a third, being thoroughly mixed in this continuous pouring back and forth much as you would mix milk and water by pouring back and forth from one pail to another.

For a small homemade mixer I would suggest the arrangement shown in the drawing above. The main part is a barrel, either a strong wooden one like oil or molasses is shipped in, or a galvanized ash barrel. The stirrer can be made of pipe. The bottom of the barrel is hinged so that after the batch is mixed, the rope or chain can be loosened, the bottom dropped part way, thus allowing the mass to slide out into the wheel-barrow standing underneath shown by the dotted lines. The engine can be mounted upon a standard at the same height as the pulley or a counter shaft can be placed up there and a belt run to the engine. After every batch is mixed and dumped, the whole machine should be washed out before the next batch is mixed. The distance the mass falls into the wheelbarrow should be small.

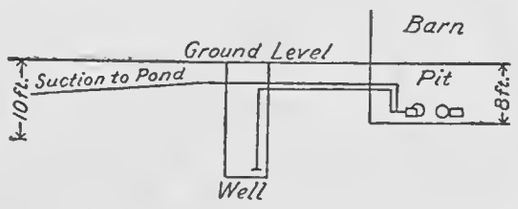
R. P. C.

An Irrigation Question.

Would you advise me of the practicability of drawing water through 150 feet of pipe to an elevation of not more than 10 feet by means of a pump for irrigation purposes? I wish the engine to be at the barn so I can use it for other purposes, also to use the same pump to draw water from a well for house and barn use independent of the irrigation. The suction pipe would run according to diagram. I would connect the suction pipes with the water supply from tank for priming. Would there be any difficulty from air collecting in these pipes so as to prevent priming? R. R. L.

Fallsington, Pa.

A pump of almost any kind or make ought to draw water to a height of ten feet through 150 feet of pipe as small as half inch, although I should not suppose you had any intention of using such

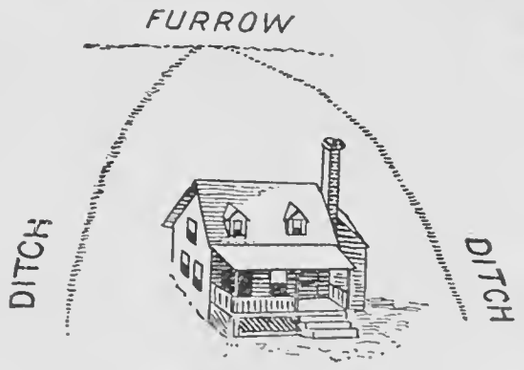


PUMPING FOR IRRIGATION.

a small pipe. If you have both pipes connected to the suction side of the pump, you would better have a tight valve in each pipe just before it reaches the pump so that when you are desirous of using the well, you can shut off the irrigation supply and when you are pumping for irrigation, you can shut off the well. As to priming, if necessary, remember that the air goes to the highest point and if you have an air valve at the highest point, you can always let the air out if it gives trouble. A simpler way would be to connect the priming pipe to the topmost point of the suction pipe, if you can. Personally, I do not see any need of priming the suction pipe if your pump is tight enough to pump air. It is not as though you were endeavoring to siphon the water. R. P. C.

Water in Cellar.

I will tell you how I overcame the trouble of water coming through cellar walls. My house stands on a slope and after a rain the cellar was flooded. About 15 feet from back door I ran a pretty deep furrow making it the full width of house and filling it with coarse gravel and broken stones. From this ditch at a point about midway of the house I ran two diagonal ditches beginning them at about three feet and ending at about 1½ feet, bringing one out at each side of the house and at least three feet from it. In



DRYING CELLAR.

the bottom I put 2½-inch tiles four inches apart, filling interspaces with gravel, and putting a layer of same on top, then filling up with dirt. Have had no more water in cellar since. M. N. G.

STOPPING A CISTERN LEAK.—On page 1301 R. L. H. wishes to know how to stop a leaky cistern. I can tell him how we did about 12 years ago, and our cistern has not leaked since. We tried cementing over the leaky places without any success; then we took the pith out of dry cornstalks, and with a blunt instrument forced the pith into the leaky places. The pith soon swelled and stopped the leak, and then we cemented over it and it has not leaked since. E. G. M.

GOOD, absent-minded old Dr. Wilder was greatly dependent upon his practical wife. One morning Mrs. Wilder sent up an announcement after he had entered the pulpit, with a footnote intended to be private. "The Women's Missionary Society," he read aloud, "will meet Wednesday afternoon, at three o'clock sharp. Your necktie is crooked; please straighten toward the right."—Woman's Journal.

How to get more work out of your horses

Keep their shoulders free from galls!

1. Be sure your collars fit—misfits cause galls, choke horses, hamper work.
2. Be doubly sure your collars are

Honest Wear Brand Gall Cure Collars

Cure galls—Lasts 1 to 2 years longer

Under the working surface is a curled-hair cushion—it cannot tear, slip or wad. It keeps the surface smooth, round and springy.

This collar prevents excessive sweating and ventilates itself—neither straw nor stitches rot out.

Made of best long straw—prevents breaking at throat, or pulling out of shape.

Look for the Honest Wear Label.

Honest Wear Brand Harness

Made of honest leather, won't rip, stitching outwears two to one ordinary stitching. Look for the Honest Wear label.

Hope Farm Notes

THE HEN QUESTION.—My scrub pens are still at the poultry contest, apparently thinking things over. They do not seem to be doing much of anything else thus far. Already a number of people are saying: "I told you so!" and having a good laugh at the scrubs. Just what they "told" I do not know. As for laughing, the last laugh is usually happiest, and sometimes he who does not laugh at all—but merely smiles—has the best lookin at the end. The Hope Farm man has started near the end of many a procession before now. The hearse may start off in front while the healthiest mourners may be far back. We are good-natured, whether we occnpy head, tail, or middle of the race.

At this time my scrubs are at the tail, with some good companions up to Dec. 19. Seven pens out of 82 had not laid a single egg! These included two pens of White Plymouth Rocks, one of Buff Wyandottes, one R. I. Reds, one of White Laced Cornish, one of Silver Campines and the Hope Farm scrubs! In addition five pens had laid only six or less. Thus we have some blue-blooded company! In all 14 pens, or 17 per cent, have laid only one dozen or less. During the week ending Dec. 19, 15 pens never laid an egg. Out of a total of 820 hens, as I figure it, about 350 still stand at the zero mark with my scrubs! In the week I speak of these 820 hens laid 1,004 eggs out of a possible 5,740. During this week 546 of the 820 hens never laid an egg! Why are the 10 Hope Farm scrubs more laughable than the 536 others? In only two of the pens did each of the 10 hens lay one egg or more. There were 79 hens which each laid five eggs, 12 that laid six eggs and two laid seven eggs, or one each day of the week. Why not laugh at these petted and pampered blue bloods? They are "worth" 10 times as much as my scrubs, but they keep no one in omelette or custard yet!

At the end of the seventh week 68 of the birds were moulting, including two of our own scrubs. Last week I asked what these tough rangers would do with their food when fed all they wanted for a balanced ration. I presume these two scrubs have answered: "We found it too rich for our young blood, and the feathers had to go!" Over 30 years ago, out on the plains, I saw a man come to town to do jury duty. He was a dry-land farmer, times were hard and about all they could get that Summer was sorghum molasses and pancakes. This man told what great things he would do on the jury as compared with a lot of "dudes" from town. He boarded at the hotel where there was a full "balanced ration" of steak, ham and eggs, white bread and similar food before him! Did he do great things? After a week he went to the judge and begged to be excused that he might go home to simple fare. Those "dudes" did well on the "balanced ration," but it was too rich for this dry-land farmer. Still I notice that in this hen contest seven out of 10 in two pens of White Leghorns are moulting, six out of another, and six out of a pen of Reds. One man who wants to give us a little New Year's cheer writes:

Why don't you start something with your pen at Storrs? Never mind, cheer up; they will have to lay in the Spring anyway.

CHEER UP.—Why, we never got down! Thus far those hens, have kept right up to expectations—which was nothing. They will start all in good time and then several of them will be heard from.

There is another hen contest on at Thorndale, Pa., and some remarkable things are being developed. A number of hens have laid an egg each day during November, December and January, as shown by past poultry contests. In one case a hen laid 60 eggs in 61 days. Mr. Pollard, who has charge of this Thorndale contest, says that four or five birds this year are laying practically every day. As egg producers and breeders to send along this Fall laying habit to their descendants such birds are worth 10 times as much as Spring layers. Mr. Pollard makes this point:

Each year further establishes the fact that more early Fall layers must be produced; 90% of the cold storage eggs of this country are laid in March and April; the season of high prices is October, November and December. With the great object lessons taught the general poultry breeder and egg farmer through these egg laying contests an adjustment of egg production will, in the very near future, be made. Hatching in January and February for early Fall layers, starting the Fall moult about the time prices begin to drop and balancing the output on a given plant by additional layers, to begin yielding in November, will be the solution to the problem of increasing the general average price the year round.

That is only one of the things these poultry contests are developing. I cannot say that my scrubs have contributed much toward a strain of Fall layers, but the game is young yet.

In seeding down I always use with Timothy Red clover and Red-top. Is it advisable to use a little Alfalfa in the mixture? W. R. K.
Bath, Me.

I think this plan a good one, and expect to follow it hereafter. It is not the nature of Alfalfa to do its best in a mixed collection of seeds, but it will make some growth and help fit the soil later for a full Alfalfa seeding. We always use Alsike clover with the Red. Parts of our farm are very sour. When we sow Red clover alone there is usually a thin seeding. The Alsike does better, and thickens out the stand.

Will the Hope Farm man print a list of grapes that in his opinion would be suitable for planting a small vineyard in this part of Pennsylvania? We are about 100 miles south of Lake Erie. P. L. C.

In this case I must play the part of horticultural moon and offer some reflected light. I am not much of a grape grower though this is a natural grape section. When I do not know I go to some one who does and reflect some of his wisdom. This is what an expert tells me:

"It seems necessary so far away from the influences of large bodies of water that the early maturing sorts be planted. I would therefore recommend Winchell, an early white grape. Early Daisy, black, early; Berckmans, red mid-season; Lindley, fairly early, red and possibly Hartford, black, fairly early. I should further suggest that these be covered by laying down in the Fall, as I do not know how severe the Winters may be."

I just bought one of the old run-down farms, 60 acres. It has not been plowed for about eight years. It is all gone to running blackberries. It has been a good farm, but all run down; the building are in good shape. A creek runs through the barn. I wish to raise pigs and chickens. I am going to pasture the pigs on rye and oats as soon as I can get it in. What do you think about it? J. H. B.
New York.

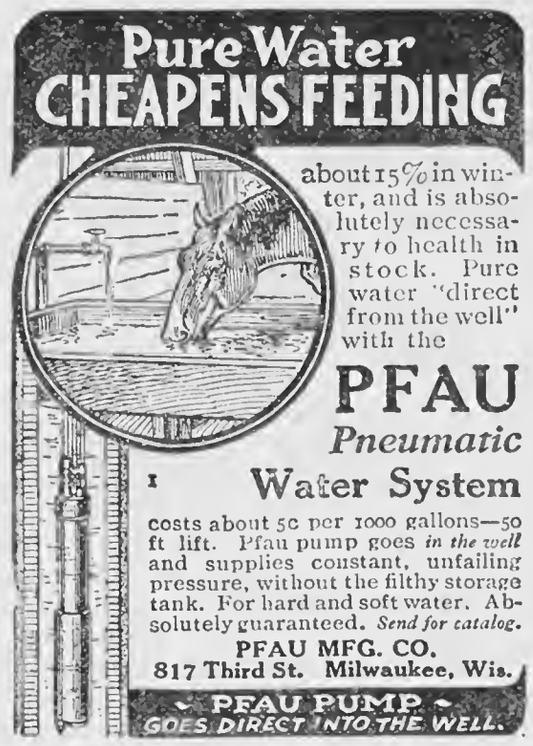
You can turn such fields into hog pasture, but it will take some time and hard work to get them going. I presume from what you say that these fields were not Fall-plowed. In the Spring start as early as possible to break them up. A disk or cutaway harrow will help in this by cutting off the roots of the vines. Put in oats and Canada peas first. Plow or chop under the peas and seed the oats on top of the furrows. Then sow an acre or two of Dwarf Essex rape with turnip seed mixed with it. Then seed a couple of acres of Early Amber cane or sorghum and follow with fodder corn. This will make a succession of pastures for the hogs, and as they eat it down the soil will improve. You will have to use some fertilizer to begin with, as these crops will not come to much on poor land alone, but if you can get them going and turn the hogs from one to another and keep some crop always coming on you will make pork and improve the farm. We have done the same thing here. There is no great profit in it, but a good way to improve the soil and handle it without great labor. You are not crazy, but have hold of a good idea if you can develop it within your means.

When it comes to the tax problem, doubtless, this State will "take the cake." In our country town the regular tax rate is 79 mills, or one mill less than 8%. And this does not include "special" taxes, as street grading, paving, etc. One-half goes to pay interest on indebtedness. In Seattle this interest charge is over $5 a year for every man, woman, and child inhabitant. Of course, it is claimed that the assessed valuation of the town and city property is very low. But the fact is that it is only a nominal one, as very little of it would sell at all even at such valuation. Fortunately people don't recognize confiscation when it comes. Some of our neighbors are paying $10 per acre annual tax on their farms here, three or four miles from town. In another county in State they are paying as high as $12 I was told. J. F. CASS.
Washington.

This beats New Jersey or any other State I have heard from yet. We ought to know more about this, and I would like to have the items which make up this enormous tax.

What is the best way to handle the droppings and litter from henhouses so as to get the most benefit from them, whether to haul direct to the field to be cultivated next year, or to store under cover till Spring? The dropping boards are cleaned twice a week, and the litter from the floors once a month. I have heard that sawdust sprinkled on the boards and kainit sprinkled over the droppings each day would hold the nitrogen until put on the crops. J. B. S.
Glencarlyn, Va.

In such a case we should take out the litter once a month as you do and either spread it on level ground or put it around the fruit trees. In our own case the latter would be the best use for the litter. We should keep the droppings separate—sprinkling land plaster, sifted coal ashes or dry dust over them to dry them out. Keep them in a dry protected place and in Spring crush fine and mix with chemicals as you will find described later on. The plan of using sawdust and Kainit is often recommended, but we like the dry fine mixture better. H. W. C.



MEN'S 4-Buckle ARCTIC SNOW EXCLUDER

Special Price, $1.69 Postpaid
ORDER AT ONCE TO GET THE BIGGEST BARGAIN EVER OFFERED.
This is an entirely new 4-buckle arctic, different from other makes. The rubber is strong and durable, with double sole and heel. The top is made of very serviceable duck material, lined with warm felt, making it absolutely cold-proof and wearproof. For comfort, warmth and perfect protection this arctic cannot be surpassed.

If you believe in music you need a Victor-Victrola

If you believe in the power of music to elevate your thoughts and broaden your intellect, to stir your imagination and quicken your emotions, to soothe your mind and lighten your toil, you can appreciate what it would mean to have a Victrola in your home.

Music is no longer a luxury to be understood and enjoyed by a select few. Music has come to be an actual necessity in every home, and its foremost exponent today is the Victrola.

With this wonderful instrument, you bring some music into your life each day to add to your happiness and make your home more complete.

There are Victors and Victrolas in great variety of styles from $10 to $500.

Any Victor dealer in any city in the world will gladly demonstrate the Victor-Victrola to you and play any music you wish to hear.

Write today for the illustrated Victor catalogs.

Victor Talking Machine Co.
Camden, N. J., U. S. A.
Berliner Gramophone Co., Montreal, Canadian Distributors

Always use Victor Machines with Victor Records and Victor Needles—*the combination*. There is no other way to get the unequaled Victor tone.

Victor-Victrola XVI, $200 Mahogany or oak

Victor Steel Needles, 5 cents per 100
Victor Fibre Needles, 50 cents per 100 (can be repointed and used eight times)
New Victor Records demonstrated at all dealers on the 28th of each month

The Home Acre.

Tree Surgery.

Can a sugar maple tree be saved if decayed part is cut out clean and filled with cement 3:1 for grouting, finished with cement and sharp sand 1:2? The cavity extends from the ground to a height of 12 feet. About 1,500 pounds of material will be required to do the work. The tree showed good vitality this year.
Pennsylvania. S. I.

Yes, such tree can be saved if there is still enough of the live bark left to provide for a proper sap circulation. The operation may be likened to filling a tooth. All the decayed wood in the cavity must be cut out. Then it should be washed with an antiseptic solution, and the concrete packed in solidly so as to keep out all air and moisture. Good judgment is required in doing this but it is possible to save many trees which have begun to decay.

Failure of Peas and Onions.

I limed my garden, about 100 feet square, with 400 pounds hydrated lime, cultivated it in and then cultivated in four pounds of Crimson clover seed. I do not think that over 200 plants were the result. What was the trouble, poor seed or too much lime, or what? What is lacking when peas and onions are almost failures, and every other sort of truck produce abundantly. F. H.
Ohio.

That was less than one ton of lime to the acre, not enough to do any damage. Crimson clover does not usually require as much lime as Red clover or Alfalfa. You probably had a lot of "dead" seed. Where other crops do well while peas and onions fail we suspect maggots on the onions and plant lice on the peas.

Transplanting Large Trees.

I have 160 peach trees that are planted on a hillside, southeast exposure. They were set two years ago; some were bearing this year, and the owners of the land sold the land this month. Would it be wise to transplant them, in Spring?
Allentown, Pa. S. L.

We should try it. Start early while the soil is moist and before growth starts. Cut back half to two-thirds of the top. Dig up with a large ball of earth around the roots and transplant as quickly as possible in moist earth. Dig a hole just a little larger than the ball of root earth and plant about an inch deeper than the trees now stand. If possible pour a bucket of water around the trees after setting, throwing soil over and pack down hard. You will have to make special arrangement with the owner of the land, for such trees have become a part of the freehold or real estate.

Treatment of Fallow Land.

I have a field of three acres that I am not prepared to utilize for about three years. What would be the best treatment for it? I want something that will take care of itself and at the same time increase fertility. Would Sweet clover answer, and will it re-seed itself? Land is gravelly light clay, well drained.
W. H.

In this case, where there is no need of working the soil for several years, we should start clovers. You will probably have to use lime at the beginning. Fit the soil well and seed to Sweet clover as usually advised, and add three pounds each of Red and Alsike. Let the crop alone to mature, fall down and reseed itself.

Moisture on Double Glass.

I have some double-light sashes which I am using on a cold frame. These sashes steam so between the glass that the sun never gets through to the plants. The steam condenses so that the drops of water collect as large as a five-cent piece, I raise the sash every nice day but it does not seem to help. Will you advise me? I am afraid this moisture will freeze and break the glass. J. W. S.
Center Moriches, N. Y.

I have been using the double-glazed hotbed sashes for three years, and have never found any such difficulty on a cold frame. I do not use hotbeds, and it may be that on a hotbed there may be some accumulation of moisture between the glasses. I have these sashes on lettuce now heading finely (Dec. 20) and have never seen any accumulation of moisture under the outer glass. If the glazing is tight I cannot see how such a condition can arise, and really I do not think that it can do serious harm. I have a large lot of these sashes, and have never had the slightest trouble with them, except that they are heavy to handle. I would not go back to the old single-glazed sashes on any account. W. F. MASSEY.

Fruit Questions.

1. I have a Rome Beauty tree, about five years old, that was doing finely; but this Fall I noticed the leaves commence to die rather early. Two weeks later I examined it, dug away the dirt, and from the top of the ground down the bark was dead all the way around the tree, and the roots seem to be all dead, too. What is the cause and what is the remedy? 2. I need about a dozen plum trees to fill out a row. How are the Wickson and Climax for a home market? 3. I can grow black currant bushes, but they don't bear like the red ones. What is the trouble?
Beaver Falls, Pa. W. S.

1. There may have been something piled about the base of this apple tree that heated and thus killed the roots at their junction with the trunk. Or, it may be crown gall or woolly aphis that has been working on the roots for years past. As to a "remedy," I would suggest that there is no remedy now but dig out the old tree and plant another. 2. The Wickson and Climax plums are of the Japan type, and will succeed in Pennsylvania. The fruit sells fairly well. It will be necessary to spray the young fruit thoroughly to prevent rotting, for this is one of the troubles that has to be met in the culture of this fruit. 3. There is much complaint of the black currants not bearing well, and yet there are cases of good bearing. It is probably because of differences in varieties, and any who have bushes that bear well should let it be known and give the name of the varieties that succeed. There is a good market for the fruit.
H. E. VAN DEMAN.

Mixed Chemicals.

I can get two carloads very cheap of a mixture consisting of the following chemicals in powder form: 60% barium, 19% lime, 15% nitrate of soda, 2% sulphate of soda, 4% water. Will you tell me whether this has any value as a fertilizer, or whether I can mix it with anything to make it valuable as a fertilizer?
E. Aurora, N. Y. C. W. E.

If this mixture contains 15 per cent of average nitrate of soda it shows 2.4 per cent. of nitrogen. We doubt if it will pay to mix it with other chemicals. We should broadcast and harrow it in for corn, grass or grain, and use potash and phosphoric acid in the hill or drill.

Sod for Strawberries and Oats.

I am a back-to-the-lander, having bought an abandoned farm up here in Vermont. Will strawberries amount to anything if set out on sod ground plowed in the Fall and cross-plowed in the Spring? Will oats do anything if sown on sod. J. F. M.
Halifax, Vt.

The troubles with old sod for strawberries are white grubs and weeds. Such sod is usually full of these grubs, and they are death to berry plants. The grass and weeds follow an old sod, and are hard to keep down. It is better to have some hoed crop follow the sod. Oats will do quite well after sod.

Don't Pay Freight on Water

Spray with NIAGARA BRAND Soluble Sulphur Compound (in Powder Form)

Dissolves instantly in Cold or Hot Water. Takes the place of and is superior to Lime and Sulphur Solution for Controlling—

San José Scale and Fungus Diseases

Also has Controlled Aphis at the same time

THE BEST ALL-AROUND SPRAY FOR APPLES, PEACHES AND PEARS

For nine years we have manufactured Lime and Sulphur Solution. Three years ago we succeeded in putting out this material in dry form which has met with the universal approval of fruit growers because it has the following—

Advantages over Lime and Sulphur Solution

A 100 lb. Drum Soluble Sulphur Compound equals a 600 lb. bbl. of L. & S. Solution. 1/6 the freight. No leakage. Does not crystallize. Will keep indefinitely in any climate. No barrels to break or return. No water to pay freight on. Controls San José Scale in four days, sticks like paint, etc. Reports from the Government, Fruit Growers and Experimental Stations covering a period of three years substantiate the above.

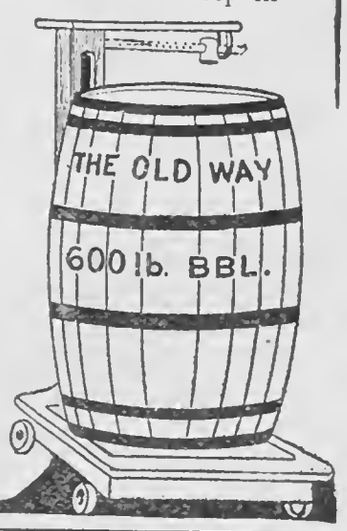
TRADE MARR



For The Orchardist

We want to interest orchardists who fully realize the advantages of possessing an efficient and effective sprayer. Every Domestic outfit is constructed to fulfill every requirement of the *commercial orchardist.* The engines and pumps on all

Domestic Sprayers

can be stopped, oiled and adjusted while standing on the ground beside the outfit. Each outfit is as light in weight as allowable to carry an engine with sufficient pressure power to pump enough liquid for four or more nozzles. Other important features are fully explained and illustrated in our free book, "Made Money by Spraying." Write for copy.

DOMESTIC ENGINE AND PUMP CO.
Box 503, Shippensburg, Pa.

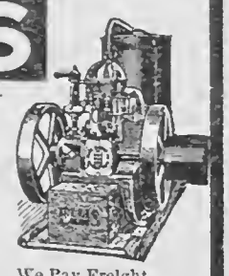
RUN ON KEROSENE
6c for 10 Hours

Ellis Engines develop more power on cheap lamp oil than other engines do on high-priced gasoline. Will also operate successfully on distillate, petrol, alcohol or gasoline. Only three working parts.

ELLIS ENGINES

have patent throttle giving three engines in one; force-feed oiler; automobile type muffler; ball-bearing governor adjustable while running and other exclusive features.

MAKE US PROVE IT—
Every engine sent on 30 days' approval. 10-year Guarantee. Special factory prices on all sizes. Thousands of satisfied users. Write for big new 1914 catalog and special discount prices.



We Pay Freight.
ELLIS ENGINE CO., 6 Mullett St., Detroit, Mich.

New Easier Better Spraying

Write For Free Book
How to save money, labor, time. Banish blight, disease and insects from orchards, etc. Use
Brown's Auto Spray
Style shown has 4 gal. capacity—non-clogging Auto Pop Nozzle. 40 other styles and sizes—hand and power outfits.

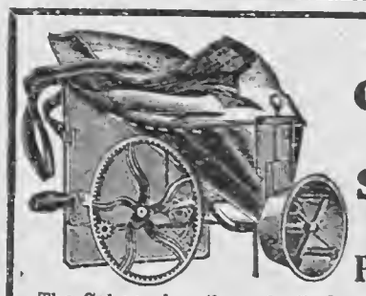
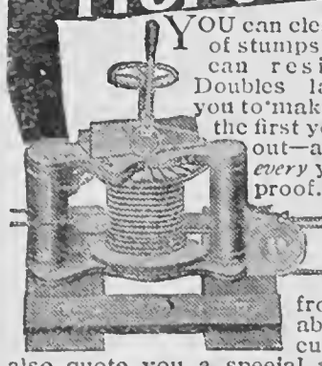
Buy A Cahoon Seed Sower By Parcel Post



The Cahoon has the only discharger scientifically constructed to scatter seed evenly in front of the operator and not against his person. Years of world-wide use prove it to be simplest, most accurate and durable Broadcast Sower made. Sows all grain or grass seed. Made entirely of steel, iron, brass and heavy canvas. Wide breast plate makes it easiest to carry. Needed on every farm. Some alfalfa ranches have a dozen. If dealer will not supply you, Parcel Post permits us to send it for $3.50 prepaid in U. S. A. Order today. Warranted to give satisfaction. *Even Seeding brings Good Reaping.*
GOODELL COMPANY, 47 Main St., Antrim, N. H.

SPRAY
The Morrill & Morley Way
Use an Eclipse Spray Pump. Used by the U. S. Department of Agriculture. Its construction is perfect. Illustrated catalogue free.
Morrill & Morley Mfg. Co.
Station 4 Benton Harbor, Mich.
Eclipse Spray Pump

Pull 100 Stumps A Day—With The Hercules

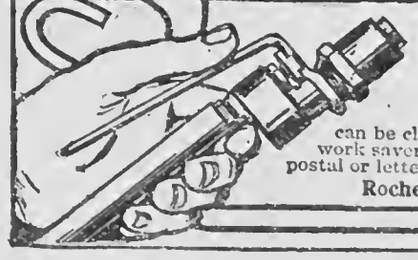


YOU can clear an acre or more of stumps a day. No stumps can resist the Hercules. Doubles land value—enables you to make $1200.00 on 40 acres the first year after stumps are out—and $750.00 in crops *every* year after. Get the proof. Why not

Write Us Now

Book tells all the facts—shows many photos and letters from owners—tells all about the many Hercules features. We'll also quote you a special money-saving price proposition that *will interest you.* Address
HERCULES MFG. CO., 130 22d St., Centerville, Iowa

SPRAY GET TWICE THE RESULTS WITH SAME WORK AND FLUID



The "Kant-Klog" gives nine different sprays from same nozzle—round or flat—coarse or fine. Starts or stops instantly—saves half the solution. The

"Kant-Klog" Sprayer

can be cleaned without stopping spray. Most simple and effective time and work saver ever known. Ten different styles for all kinds of spraying. Mail postal or letter quickly for free facts. Get our new offer. Agents wanted.
Rochester Spray Pump Co., 195 Broadway, Rochester, N. Y.

Spray Your Trees Early Any time this winter and early spring when the temperature is not below 40° F. you can spray with "SCALECIDE" and kill the scale, eggs and larvae of insects wintering on trees, as well as spores of fungi that can be reached by a winter spray. Prepare now for a good fruit crop next season.

"SCALECIDE"

TRADE MARK REG. U. S. PAT. OFFICE

will absolutely destroy San Jose and Cottony Maple Scale, Pear Psylla, Leaf Roller, etc., without injury to the trees. It costs less to spray an orchard with "Scalecide" than with Lime-Sulfur—and you secure better results. We back up this claim. Write today for free booklets—"Proof of the Pudding" and "Spraying Simplified".

We are World Distributors for
Vreeland's "ELECTRO" Spray Chemicals

and "Electro" Arsenate of Lead Powder (33%) which, used wet or dry, has no equal in strength or texture. Avoid imitations. B. G. PRATT CO., Dept. N 50 Church Street, New York City.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

NEW YORK farmers are still writing about compensation for cattle or horses killed by agents of the Agricultural Department some years ago. The cows were afflicted with tuberculosis, while the horses were glandered. These animals were killed before the general law providing compensation was passed, and therefore no appropriation was made to cover such cases. The only way to recover is for the Legislature to pass special bills covering each case. This has been done in a number of cases within the past few years. A farmer who has suffered loss in this way should get his proof into shape and ask his Senator or Representative to make up a bill and introduce it early in the session.

*

EFFICIENCY! That is the new word which farm writers are now playing football with. The efficient man is evidently the one who makes most of his powers and learns to do his work with least waste of mental and physical force. To be efficient is to be economical of power. On page 35 you find the picture of a so-called farm gate which is a badge of wasted energy. This collection of scraps and refuse has been taken down and put up again twice a day for months to let the stock pass through. A few blows with a hammer, a few boards and hinges would save all these hours of labor. Smile at it, and then see if your gate to efficient work is like it.

*

J. H. HALE tells us of a case where a wealthy man had been in the habit of making Christmas presents of boxes of oranges. This year, after investigation, he decided that good apples would prove a more acceptable gift. So he gave an order for 21 boxes of high-class Baldwin apples, which were turned over to Santa Claus to distribute. Of course we may be prejudiced in favor of the apple, but we think this was a good substitution, not only for the consumer but in the interests of the good old American fruit. And by the way, new varieties may come and go with more or less of "boom," but the good old Baldwin, properly grown on suitable soil, is what we come back to.

*

FOR many years the "experts" taught us that Long Island is out of the "apple belt." Years ago there were some good orchards on the island, but many of them were ruined by the scale and others passed out. Somehow most people seemed to get the idea that the soil and climate of Long Island are not suited to apple culture. Mr. Peter Elbert Nostrand has taken this idea out and buried it in his orchards. Down at the east end of the island Mr. Nostrand has planted 110 acres of trees. They are coming into bearing and producing fruit of unmatched quality and beauty. In 1912 Mr. Nostrand won $69 in prizes at the New York State Fair, including nine firsts. In 1913 he won $188.25 in prizes, including 17 firsts, wth the $50 prize for best collection. Add to this 100 other local prizes and you may understand how Long Island rose up out of the sea, shook herself and beat the State at apple production. We like this because it shows how men may take what the experts call unpromising conditions and through the application of business judgment and scientific treatment beat these same experts at their own game. We are glad to be able to announce that Mr. Nostrand will tell us how he did it.

I UNDERSTAND that you have reported several criminal cases where men were punished for shooting at chicken thieves. What were the facts about these cases? J. M. G.

We have reported two cases. One was in Massachusetts. A crippled man was aroused at night by noise in his chicken house. Going out, he saw two men, who ran away. The owner fired his gun at random to frighten the thieves. In the morning the dead body of one of these men was found near the road. The cripple was tried, found guilty of manslaughter and sent to jail. Public sentiment was aroused and the prisoner was pardoned by the Governor.

The other case was in New Jersey. Two boys, living with their mother in a lonely place, were aroused at night by the dog. One of these boys fired a gun into the air. Two men ran, one climbing the fence and the other apparently dodging behind an outhouse. After calling, and hearing no response, the boy fired again in the direction of the house. Search revealed a man shot dead. The boys were put on trial and the prosecution tried to show that they fired directly at the man, who was not engaged in any unlawful act at the time. The judge ordered the jury to acquit these boys, saying:

It was their duty as sons to protect their mother's home from an invasion by trespassers. Instead of being condemned for that act they should be commended. To find these young men guilty under such facts as have been presented is to take away from the citizen the right to protect his home. These young men committed no crime.

In this case public sentiment was with the boys, and the prosecution seems to have been quite perfunctory. From this it would seem that the bed of the chicken thief will contain very few feathers if he is caught in New Jersey.

*

THE Secretary of Agriculture has decided that no potatoes shall be brought in from foreign countries. This was done to prevent the importation of potato diseases. Now it is found that germs of these diseases are carried not only on the tubers, but on the sacks or bags in which these potatoes are carried. For example, a good share of our seed-potatoes seems to have been shipped in these foreign second-hand sacks. The scientists have found these disease germs on such sacks. We might about as well use the clothing of typhoid or smallpox patients without fumigation. Thus the Department advises:

Farmers should require dealers to guarantee that the sacks have been sterilized. Purchasers of seed potatoes should specify that the seed came in new sacks or sterilized second-hand sacks. Dealers can sterilize these sacks before offering them for sale by placing the empty sacks in tight containers in which live steam should be injected for about an hour. Purchasers of second-hand sacks can protect themselves by following the same procedure or by boiling them for two or three hours in any available vessel. Unless these precautions are taken the use of new sacks exclusively is recommended.

It is such an easy matter for the dealers to boil or steam these sacks that they cannot make reasonable objection to the plan.

*

WE see from the articles on acid soils why forest leaves often prove disappointing as a fertilizer. They evidently contain plant food and considerable lime, but they are too sour. After a time the acids disappear and the lime is left. Then the decayed leaves or humus become good fertilizer or rich soil. At every turn we find fresh evidence of the need of lime on our Eastern soils if we are to grow the lime-loving plants like clover, Alfalfa or wheat. Where lime is reasonably cheap it is good farming to buy it and grow these crops, even if we are obliged to change the entire nature of the soil in order to do it. We believe, however, that there are cases where lime is too expensive to use it in large quantities. In these cases it will often prove more profitable to give up Alfalfa, Red clover and wheat and grow those crops which are naturally suited to the acid soils. Cow peas, Soy beans, Crimson and Alsike clovers will grow fairly well in acid soils to gather nitrogen. Red-top may be used in place of Timothy, and rye and buckwheat in place of wheat and oats. This is one of the new problems which scientific knowledge has brought up. As usual the scientific men work out the principles involved, while the farmer must work out the practice.

*

FOR the past few years New York farmers have been advised to plant the Rome Beauty apple. Many thousands of the trees were planted. This variety is very satisfactory where the conditions are suitable—for example, along the river in Southeastern Ohio. Could it be grown as well in New York it would prove a valuable addition to our list of market fruits. It seems to have failed at the test, having been badly injured by freezing. Many of the young trees have died, and the variety would better be cut out of the New York list. You might say that Jack Frost has sent the beauty of Rome Beauty roaming. This incident illustrates the trouble which results from substituting advice for experience. Many a farmer has bought trees or machinery or other goods upon advice alone, only to find that these things were untested, and he must pay for the needed experience. This should be remembered now when the season of "novelties" has come. We print names of these novelties and permit the introducers to make reasonable statements about them. People always come asking if we advise "plunging" or buying heavily while the price is high. We answer *No!*—unless you are prepared to gamble or take a chance, and will make no complaint if the "novelty" proves unsuited to the conditions in your locality. It pays to try these new things in a moderate way, but planting a large acreage to a high-priced novelty is simply taking a speculator's chance—and nothing more.

*

I NOTICE that THE R. N.-Y. has not changed its course, even if the wind has. Having done so much toward giving to the country the parcel post, it would be in fashion to take a well-earned vacation; but, instead, you seem to press right on to other useful things. In a way, such must be uphill work, and generally avoided by lovers of ease. All are not finding the intrinsic pleasure that comes from doing an honest day's work, and yet the uphill onward march gives a wider view of things, and a clarified air in which to live. And in those higher altitudes of striving to help the race are those who first see the dawn of a better political, social and religious day. Labor being a blessing, the fearless, honest newspaper man has his full share of both.

Of all the unhappy, useless people we know of we would hand the prize to the man who stops growing, satisfied with some little achievement, and sits down to spend his years bragging about it. There is your true "conservative"—narrow, bigoted and selfish. Sometimes our friends come here, saying: "You are doing a grand work." How well we know that if we once began to think so our work would be worth but little.

When a man can feel that his labor and thought have changed history for the better a little, he may do one of two things. One is to imagine he is IT, and proceed to pat himself upon the back. The other is to realize that he is nearer "nit" in the world's great economy, and that the more he keeps in the limelight the shabbier his poor little record will appear.

*

"SCREENINGS" from a mill often if not usually contain weed seeds, dirt, splinters and other trash. Some of this stuff has feeding value—perhaps half as much as good bran or middlings. Flour mills have taken up the practice of running this stuff in with the bran. In other cases this trash is mixed with molasses and sold as a "molasses feed." The Department of Agriculture has ruled that this mixture is adulterated when branded as "bran" or "middlings." We understand that some of the mills will try to surround this by branding as follows:

BRAN
With Screenings
Not exceeding Mill Run.

What is meant by mill run? Probably anything that could run out of a mill-spout into a bag. Under the law any mixture not harmful to stock health may be sold, provided the tag shows what it is. On the same principle, how would these millers like to buy food branded in this way?

MILK	CHICKEN
With Water	With Sand
Not exceeding Rainfall.	Not exceeding Beach Run

We should hear from these millers at once; yet their plan evidently is to work off their weeds and trash, legally, through the failure of farmers to read these tags! Farmers who want the pure bran should read every tag and refuse to buy any tagged as screenings. If you find "pure bran" containing the screenings keep the tag and the mixture and notify the Department of Agriculture at once.

BREVITIES.

GERMAN pencil manufacturers are after California cedar. They will probably start a factory there.

THE latest is a Society for the Advancement of Forest Entomology in America. It is open to anyone who is interested in preserving our forests.

No question about the great value of skunks and snakes in destroying insects, but can you convince the average farm boy that he should not kill them on sight?

IF the wife helps her husband milk when he has a sore arm, he should help with the kitchen work when she has a headache.

A GOOD New Year's resolution: "I will spend as much time *working* to put running water and similar fixtures into my house as I spent last year in *talking* about the Mexican question and other *great* problems which I could not influence."

THE papers report that a gang of outlaws in Kentucky are besieged on a mountain. They have a dozen hens, and, as the report runs, "they can hold out indefinitely if the hens continue to lay." The Hope Farm man is having an experience with some Kentucky scrub hens in the laying contest. If those outlaws cannot make their birds do better they will soon be starved out. However, these scrubs may not lay an egg all through the year, and yet in the end teach the poultry world a more practical lesson than Barron's best hen.

"TWO BLADES OF GRASS."

However desirable increased production on farms may appear to be from the consnmers' standpoint it does not follow that such increased production would resnlt in any increase in the cash income per farm or per capita of farm population, or that prices paid by consumers would be any lower. * * * When as the result of such organization and improved methods the price of farm prodncts can be maintained at a higher level without increasing the cost to consumers, farmers will be jnstified in increasing the output of their farms with a fair prospect of realizing a reasonable profit on their investment of time, labor and money, which in the aggregate is enormons.

Look who's here! What heretic is this who pulls one blade of grass out of the pleasant dream of the "authorities"? It must be some "disgruntled old grouch," or some 35-cent-dollar crank. No, gentlemen; guess again. It is Hon. David Houston, U. S. Secretary of Agriculture! That is what he says, and he proves his words by facts and figures. He says the total value of farm products for 1913 was $9,756,000,000. The net farm income, as he figures it, is $4,074,027,499. In 1912 the total crops were considerably larger than this year, yet prices were better, and the farmers received about $500,000,000 more for this year's smaller crops!

Had the total prodnction in 1913 equalled or exceeded the 1912 production it seems probable that the cash income per farm would not have been greater, and might have been less, than in 1912; but it is extremely donbtful whether the cost to the consumer would have been any less because retail prices are promptly raised on a prospect of underprodnction, but are very slow to decline if there is overprodnction.

True as gospel, and everyone knows it—including those who still talk "two blades of grass." It has been proved again and again here in New York City. Be the crop large or small, prices for such staples as bread, potatoes, milk and groceries rarely vary from year to year. There have been seasons when farmers in the interior received 20 cents a bushel for potatoes. In other years these same farmers received 90 cents or even more, yet housekeepers know they paid practically the same for a peck of potatoes each year. As we see, the farm price for crops this year is figured at about $4,000,000,000. The final consumer paid at least $13,000,000,000 for this crop before it reached his mouth or body. The best thing the present Administration has done thus far is to recognize the truth of the 35-cent dollar and the folly of the "two blades of grass" theory.

"I THROW THEM RIGHT INTO THE WASTE BASKET."

The speaker was an educated man—a teacher and clear student. He is a good speaker, capable of making a convincing address before an audience of thinking or fairly educated people. This man referred to the letters or questions from the class which he calls "cranks." This means people who get away from the conventional things and ask questions which get far below the polite falsehoods or fashionable ideas of life. Sometimes the "crank" comes with what seems from our present knowledge a wild and impossible theory. In meeting such people mentally our friend would get rid of them in the easiest way, and devote his energies to those who came nearer his own lines of thought.

"*I throw them right into the waste-basket.*"

This time it was an agricultural editor. He referred to the same classes of people, and also to the people who ask what he calls simple questions, or things which he has answered time after time. Usually, however, he referred to the man who puts up an unpleasant truth which cannot be answered without kicking over some timeworn prejudice or habit. This man pointed to several leading farm papers which refuse to answer questions by mail, and intimate that they do not want suggestions from readers.

We told both these men that they are wrong—that is, if they ever expect really to grow mentally, or in sympathy or instinct. A man may think he is growing rapidly if he is able to keep a little ahead of men of his own class and capacity. For example, a farmers' institute speaker may go about year after year, meeting the same small audiences of selected people. He may bring this small proportion of selected farmers a fresh message, and still 'be unable to answer the arguments of the "cranks" or the uninformed farmers. It is strange that such men cannot see that the mental struggle required to make their learning clear to the dull or uninformed will do them far more good than acquiring fresh knowledge which they cannot make soluble! Do they not see that "throwing it into the waste-basket" is a confession that they cannot answer the "crank," or put their learning into the plain language of homely people? We think that herein lies one great trouble with our agricultural education. We are making it too much of a class privilege for the naturally bright and strong. The best way to spread it is to learn how to answer the "cranky" and explain to the dull.

COMMISSION MEN AND TREE LEGISLATION.

There are two things that I believe the farmers of New York may reasonably seek to have enacted into laws during the coming session of the Legislature.

Pick up the loose ends of the commission merchants' bill. The things needed to perfect this law should be immediately discussed in detail, not in general terms. I may say that one of the untouched evils of the business is the ease with which the commission man may become a dealer, either as wholesaler, jobber or retailer, in the same kind of goods as he is selling on commission. If a legal way can be found, I believe it would be a good and just thing to forbid every commission man being a dealer in the same kind of things as he sells on commission. Another wrong that ought to be corrected is that refinement of means for taxing the farmer's dollar—the middleman between the commission man and the retailer. Time was when the commission man sold direct to the retailer, making his commission carry the goods into the retailers' hands direct and guaranteeing the account. Now he often saves himself much of this trouble and cost by passing the goods through a wholesaler or jobber. The worst of this is that the latter is unrestrained; being a "buyer," he may sell the goods for what he chooses. So it falls out that the farmer, instead of paying 10 per cent for getting his products into the retailer's hands, as he supposes to be the case, is very often, I fear, paying 25 per cent or more. I am well aware that there is a proper place for the wholesaler in the produce business, but that place is not in taking over the real duties of the commission man, and for which the commission man is paid. For one thing, I believe the commission charged the farmer should be, when his products are sold to a wholesaler or jobber, but one-half the amount charged when the sale is made direct to a retailer. It is to the great mutual interest of the consumers and the producers that the horde of people who stand between them be as few and as modest as may be, and any reasonable proposition to that end well backed is sure to find friendly consideration in the Legislature.

We must demand a good nursery tree bill, and stick to it till we get it, and get it right. The Vert bill as amended through the influence of the legislative committee of the New York State Fruit Growers' Association, with the full approval of Mr. Vert, was a good bill. The bill was materially modified in favor of the nurserymen as it progressed through the Assembly, the bill failing in the Senate, mainly through lack of time. It is significant of the strength of our position that we could get so good a bill through the Assembly the first year, even admitting that it had some serious defects. Mr. Vert was true to us and a good fighter. The fundamental principle of this bill is that the farmer has the right to demand that he invariably be informed where the trees were grown and by whom. The nurserymen reluctantly conceded this, but minimized its effect by providing that the farmer shall be given the information when the trees are shipped—at a time when the farmer has his ground and his mind ready for them, and would do little else then than accept and plant them, wherever they came from.

I believe it to be a reasonable proposition, and moreover an attainable one, that every nursery tree label shall give on one side the name of the variety and on the other side the name of the grower, or for whom grown, and the place where grown. We don't want a "list" giving the information, prepared in the office of the shipper and sent to the farmer at the time of the shipment. We want labels—real labels, inseparably a part of the variety label—labels put on where the tree is grown, and we want these labels on every nursery tree sold in the State of New York, wherever grown. Then we want to know this at the time of purchase, or not less than two months before delivery, because it is not a safe assumption that the trees are coming from the nursery 'selling them. And we want some penalties that will count, and count hard, for delivering trees not true to name.

Kinderhook, N. Y. DATUS C. SMITH.

As a general proposition we think there has never been in 20 years a more promising outlook for Eastern farmers to push some line of live stock. Year after year the supply of meat in proportion to population grows less and less. The future seems to offer the surest thing in the way of a market for all kinds of meat. In the past many of our farmers became discouraged because there was no competition in buying. The "Meat Trust" monopolized the trade and drove out the small buyer and slaughterer. We think this objection will be, partly at least, overcome. The development of parcel post will mean an immense direct trade in poultry, pork and smaller cuts of veal, mutton and beef. Then we think the Government will finally step in with Federal slaughter houses, where live stock may be slaughtered and dressed at a fair price. These things may come slowly, but they will surely come, and they will give our farmers a chance to obtain more than 35 cents of the dollar. Live stock, too, will help **take care of our farms** and give a more profitable winter work. We believe this development of meat-making on our Eastern farms will give opportunity once more to many of the smaller dairy farms—now dismissing their cows because the cost of producing sanitary milk is too high. One thing is sure, however, the future live stock business has no place for the "scrub." The pure blood or the high grade will be the only animal that can pay for its board. In the past farming has actually been able to carry a lot of boarders and robbers. It cannot do so in the future.

*

"*Go West, young man!*" That was the slogan which Horace Greeley took up shortly after the Civil War. Without question this advice so persistently repeated did much to feed the stream of humanity which ran down the hills away from our Eastern farms. In those days the argument was a strong one. The Eastern soils had been cultivated for a century and were losing their power to produce. The modern system of using chemicals had not been worked out, and the depleted Eastern farms were in direct competition with the new and rich soil of the West. In those days a young man could go West and obtain for almost nothing a new farm, the soil of which was nearly as rich as the leached manure in the old barnyard at home. As one of the young men who took Greeley's advice, the writer knows the power of this old argument, and something of the historical effect of this desertion of the Eastern farms. Now, however, the time has come to put Greeley's advice on the scrap heap of agricultural history.

"*Stay East, young man! Stay where you are!*"

That may be called the "up-to-date" argument. The West has no more cheap land to give you. The only low-priced land now left for you is far away in some lonely place, where you will be at the mercy of a long string of middlemen, who must finger what you raise. The hope for the future farmer is not so much in raising enormous crops as in direct trade—getting closer to his market. The strip of land 150 miles wide along the upper Atlantic is destined to provide the best markets in this country and to contain the most profitable farms. Here is to be found the future land of opportunity for the sale of farm products of high grade. And so we say in this newer time, "*Stay East, young man! Stay East!*"

Government Crop Reports.

According to the U. S. Department of Agriculture the value of home-grown crops for 1913 was as follows:

Corn	$1,692,000,000
Cotton	798,000,000
Hay	797,000,000
Wheat	610,000,000
Oats	440,000,000
Potatoes	228,000,000
Tobacco	112,000,000
Barley	96,000,000
Sweet Potatoes	43,000,000
Sugar Beets	34,000,000
Cane Sugar	26,000,000
Rye	26,000,000
Rice	22,000,000
Flaxseed	21,000,000
Hops	15,000,000
Buckwheat	10,000,000
Dairy Products	814,000,000
Eggs and Fowls	578,000,000
Wool	51,000,000

The value of all agricnltural exports in the fiscal year ending June 30 was $1,123,021,469.

Lyle's Wheat Estimate.

The estimated distribution of the domestic supply July 1, 1913, to July 1, 1914, is as follows, in bushels:

Farmers' hands, July 1, 1913	35,515,000
Visible supply, July 1, 1913	30,163,000
Crop 1913	763,380,000
Supply	829,058,000
Disappearance six months ended December 31, 1913:	
Exports (December estimated)	95,000,000
Seed, winter wheat	42,000,000
Feed, screenings' losses, etc	15,000,000
Consumption	237,500,000
Total disappearance	389,500,000
Remainder January 1, 1914	439,558,000
Disappearance six months ending June 30, 1914:	
Seed, spring wheat	22,500,000
Consumption	237,500,000
Feed, screenings' losses, etc	8,000,000
Total	268,000,000
Remainder	171,558,000

The remainder must supply the exports for six months and what will be in farmers' hands and the visible supply on July 1, 1914. The figures suggest we have about 100,000,000 bushels available for export in the coming six months that must be sold in competition with Russia, Danubian districts, Canada, Argentina and Australia.

(*Extract from Contract*)

" . . . . . S. L. Hiatt hereby agrees to furnish William P. Stark exclusively all buds, scions, grafts and wood that may in any way be cut from the original Delicious tree, as William P. Stark may direct, and give William P. Stark the exclusive right to control of the scions, buds, grafts and wood for a term of twenty (20) years."

(*Extract from Contract*)

" . . . . . John H. Hale and the J. H. Hale Company do hereby grant, assign and set over unto William P. Stark and William H. Stark the exclusive right and control of the propagation and sale of the said J. H. Hale Peach. J. H. Hale agrees to personally supervise the cutting from bearing trees of said J. H. Hale peach all such propagating wood and buds as may be requested from time to time."

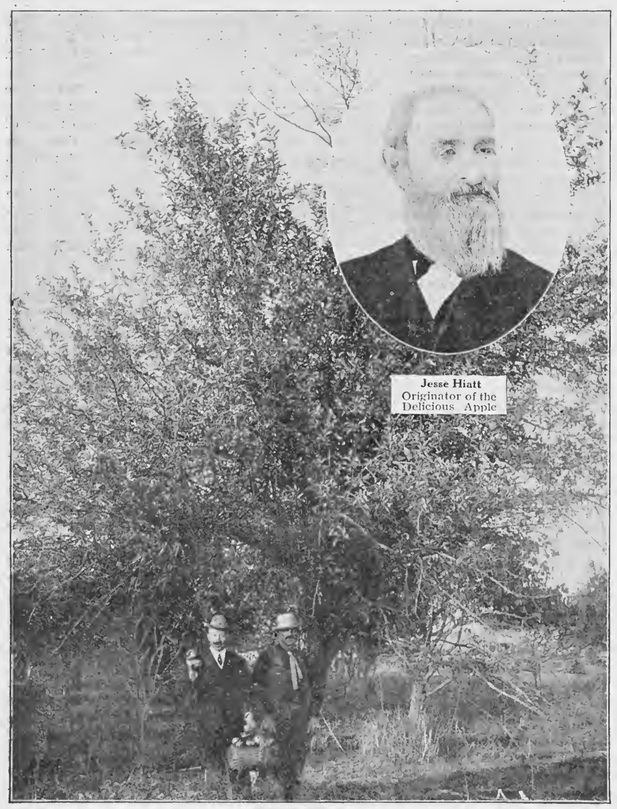
Two great fruits

and two contracts protecting tree planters

The Delicious Apple

and

The J. H. Hale Peach



William P. Stark, S. L. Hiatt and the original Delicious tree

Genuine Delicious at growers' prices

You who have wanted *genuine* Delicious trees can *now* get them direct from the William P. Stark Nurseries, of Stark City, Missouri, at *growers' prices.* We ship you direct from our nurseries one or two year old guaranteed Delicious trees, personally selected by William P. Stark.

Pictured above is the original Delicious apple tree, the most profitable apple ever produced. The tree is now 42 years old and, with one exception, has never missed a crop since it came into bearing. It has survived extreme drouths and severe winters which killed 90% of the other trees in the same orchard. Since the time when Jesse Hiatt, the originator, first gave Delicious to the world, William P. Stark has been intimately associated with its development and success. From Mr. Hiatt's son, S. L. Hiatt, we have secured the *sole* rights to all buds, scions, grafts and propagating wood from the original tree. The purity of our stock is therefore positively assured.

Tops the market everywhere

On the average Delicious brings $1.50 to $3 per box more than Jonathan, McIntosh Red, Stayman Winesap and other high-priced apples. Western growers often sell the fruit by the carload at double the price of other varieties.

It is the best money-maker and the best orchard tree you can plant. Give at least one-half to three-fourths of your apple orchard to Delicious. But be *sure* they are grown by William P. Stark of Stark City, Missouri.

Our Money-Saving Prices

We will furnish you genuine Delicious apple trees at less than you would pay traveling tree-agents for ordinary trees. These low figures are possible because we sell only *direct* from our nurseries—we pay no commissions or salaries to middlemen, nor share profits with agents. Write for catalog to-day.

These two matchless fruits command highest apple and peach prices everywhere. Fruit growers, horticulturists and experts unanimously agree that they are unequalled for high quality, flavor, shipping qualities and market returns. Our exclusive contracts guarantee orchardists everywhere genuine, pure-strain trees of both varieties; one contract with Mr. J. H. Hale, of South Glastonbury, Connecticut, originator of the J. H. Hale peach; the other with Mr. S. L. Hiatt, of Peru, Iowa, son of the late Jesse Hiatt who originated the nationally famous Delicious apple. Read these contracts printed above.

Buy direct from nursery — save 30 to 50 per cent

No agents

We do business with you direct. We have no agents, no middlemen, no plate-book men. Our catalog is our only salesman.

When you buy from the William P. Stark Nurseries you save the 30 to 50 per cent that you would otherwise pay an agent or salesman. You get your trees perfectly packed, in perfect condition. Our customers tell us they like to do business this way. It means a very pronounced saving and it means better trees. Send us your order.

William P. Stark
who, since Jesse Hiatt, the originator, first gave Delicious to the world, has been intimately associated with its development and success.

Grown under William P. Stark's supervision

"I have specialized in propagating vigorous, healthy trees for tree planters. It has been my life work and the life work of the folks in the nursery and office. This thing we do well—grow good nursery trees and sell them at the lowest possible price. I offer you trees grown under my personal supervision, by as good nurserymen as ever planted a graft and in soil that makes the finest trees I have ever seen come out of the ground. Such trees, doubly guaranteed, I offer you direct from our Stark City, Missouri, nurseries to your orchard and save you all the 'in-between' profits."—William P. Stark.

Everything for orchard or garden

We list in our catalog only tested, dependable varieties. The descriptions are clear, understandable, concise. Under each variety is given the section for which it is best adapted, so you can select the fruit which grows best in your locality. Every variety is *doubly guaranteed* to be true to name.

Apples, McIntosh Red—A good apple for New England, Middle Atlantic States, Montana, etc. High quality. Very hardy.

Wealthy—Hardy, showy bright red fall or early winter apple. A very profitable variety, and universally popular.

Baldwin—For those who want a reliable staple. We have some exceptional Baldwin trees, 1 and 2 year.

Rhode Island Greening—Well known as a standard commercial fruit throughout the East. Rich flavor, juicy.

Yellow Transparent—One of the most profitable early apples. Especially valuable near good markets.

Pears—Bartlett, Comice and Anjou—The best varieties for home or market. The standards everywhere.

Peaches, Early Elberta—A fine large freestone. Better quality than ordinary Elberta. Ripens early. Good canner.

Elberta—Needs no comment. We have splendid one-year-old trees. Lowest prices. We suggest, however, planting J. H. Hale instead.

Plums—Every home should have a few plum trees. Need little care. Pay remarkably well.

Cherries—Very profitable as orchard fillers. Montomorency, Early Richmond—the very best in sour or sweet cherries.

Grapes—Successful everywhere. We can supply the finest varieties at very low prices.

Bush Fruits—We supply selected stock in currants, gooseberries, raspberries, blackberries, etc. Field-grown roses, ornamentals, shrubs and shade trees of all sorts.

Our Parcel Post department

We make a specialty of Parcel Post orders, and furnish best grade, heavy, stocky plants and trees of mailing size. They are well developed and make large, thrifty orchard trees and ornamental shrubs. This is a decided convenience on smaller orders, or if you are distant from railroad or express office. *We pay the postage.* Our brick packing house is probably the most complete and best equipped brick packing house in the county. As it is immediately adjacent to the nursery, trees are transferred to packing quarters with no loss of time. Roots and trees are not exposed to sun or wind for a minute. They reach you with the original vigor unimpaired.

Send for 120-page book—It contains the complete J. H. Hale story. Handsomely illustrated. Lists and describes most desirable apple, peach, pear, plum, cherry, quince, apricot trees, grape, currant, blackberry, raspberry, gooseberry, roses, shrubs and ornamentals. Send the coupon to-day.

Station W-2

William P. Stark Nurseries, Stark City, Mo.

Mr. J. H. Hale among bearing J. H. Hale trees in his Connecticut orchards

J. H. Hale—the money-making peach

Mr. J. H. Hale, successful peach orchardist and foremost authority on profitable peach growing, for years sought a variety with *all* the qualities that *now* exist in the J. H. Hale peach. But not until he discovered this marvelous peach was he willing to lend his name to any fruit.

Imagine a peach that embraces *all* these splendid features:

Size like a small cannon-ball.
1/3 to ½ larger than Elberta.
Rich golden color; carmine tinged.
Ripens 5 days ahead of Elberta.
Colors 10 days before ripe.
Luscious flavor.
Flesh solid as a cling.
Perfect freestone.
Practically fuzzless skin.
Ships almost like apples.
Ideal for canning.
Ripens early—hangs late.
Hardiest known in bud and wood.
Outclasses and outsells the best Elberta that ever grew.

Stands shipping—great market peach

The tough, tight skin and firm flesh make the J. H. Hale a wonderful keeper and shipper. It does not "squash down." Its wonderful keeping quality gives the retailer more time in which to dispose of his consignments. This means bigger profits to the grower. Last fall Mr. Hale received $2.00 to $2.50 per bushel f.o.b. his orchard for J. H. Hale peaches, while the best Elbertas from the same orchard brought but $1.25 per bushel. From one acre of 133 J. H. Hale trees he took $1,462.

Big over-demand this year

Already a large part of our present stock of J. H. Hale is sold. We certainly will not be able to supply the entire demand. For peach-growers are now surer than ever of the future of this peach, because they have the 1913 record of crop returns.

Our stock is being depleted fast. From California comes an order for enough to plant an enormous ranch of several hundred acres. Mr. Bert Johnson, the famous peach-grower of Arkansas, is planting 10,000 J. H. Hale trees. A Michigan grower has taken 1,200. Massachusetts and Connecticut planters are ordering in big lots.

Reserve your trees now. We will ship whenever you direct. But we suggest you avoid the disappointment of late ordering.

From Day to Day

THE CHURCH BELLS.

Oh, holy Sabbath bells!
  Ye have a pleasant voice!
Through all the land your music swells
And man with one commandment tells
  To rest and to rejoice.

As thirsty travellers sing.
  Through desert paths that pass,
To hear the welcome waters spring,
And see, beyond the spray they fling,
  Tall trees and waving grass.—

So we rejoice to know
  Your melody begun;
For when our paths are parched below,
Ye tell us where green pastures glow,
  And living waters run.
—George Macdonald.

*

"LITTLE Harry wanted a dog," says Judge. "He had many arguments with his mother on the subject. He was sent to a near-by grocery. He was gone so long that his mother became anxious. Stepping to a window, she saw Harry down the street manfully pulling on a rope, the other end of which was tied around the neck of a small dog. The pup was resisting every step. Braced on all fours, it was pulling back with every ounce of its small might and barking as loudly as possible.

"Presently Harry triumphantly entered the room. 'Mother,' he called, 'won't you let me keep this little dog? It followed me home.'"

*

THE following instructions for cleaning white feathers are given by the household economics department of the Colorado Agricultural College: Make a strong suds of lukewarm water and ivory or wool soap. Put the feather into the suds and wash thoroughly, being careful not to break the shaft. Rinse well in lukewarm water and draw between the fingers to remove as much water as possible. Spread on a sheet of clean wrapping paper one-fourth to one-half cup of corn starch. Shake feather in the corn starch until it is dry and fluffy. One is apt to become discouraged during the process and think the feather is ruined, but if directions are followed she will feel more than repaid by the final results. The corn starch keeps the barbules from sticking together and makes the feather appear light and fluffy. If the feather is to be curled, cover with tissue paper. Pull out from under the paper three or four barbs of the feather and draw over the edge of a very dull knife. Repeat until all the barbs have been curled.

*

BUSY country women who have used up old materials and oddments of time in making braided rugs always feel some surprise in seeing these homemade economies included in "household arts and crafts." Such rugs are received in very good company these days, and they are not made in any way different from those that repose on many a rural kitchen floor, except that more thought is given to the color combinations. The strips of material are dyed before braiding, and some harmony of color carried out. Very attractive rugs are made by using black for the center, then bordering with blue or green, shading from a very dark to a lighter shade. Where the rags vary greatly, some dark, some light, they often take the dye differently, and this gives varying tones of the one color that are very attractive when made up. The mixed hit-or-miss braided rugs are very commonplace, but dyeing and blending harmoniously give ample returns for the trouble taken.

Old-Fashioned English Apple Dumplings.

Prepare one heaping cupful of finely chopped beef suet, turn this into two cupfuls of flour, add a pinch of salt, and mix all thoroughly while dry. Moisten with enough cold water to make a stiff dough, knead well with the hands, then cut in pieces large enough for each to cover an apple, thick and evenly. Peel and core apples, leaving them whole. Take a piece of dough, work it a little on the board to make it smooth and even; then with thumbs work it into rounded form depressed in center. Place the apple on it and mould the dough up gently until it covers the apple. Be sure to pinch the dough firmly together at the top, so as to leave no crack for the water to enter. Have a saucepan of water boiling hard, and drop the dumpling in. Keep the water boiling steadily until the dumplings are taken out; they are usually well cooked in half an hour. Some of my friends prefer tying the dumplings in a floured pudding cloth, each one separate, but for myself I prefer cooking without the cloth, but the water must boil when the dumplings are put in and be kept on the boil the whole time, or the crust becomes sodden and heavy.

MRS. J. T.

The Rural Patterns.

When ordering patterns always give number of pattern and measurement desired.

7435 Combination bust confiner and corset cover, 36 to 46 bust. 7910 One-piece corset cover for misses and small women, 14, 16 and 18 years. With or without peplum. 7742 fancy yoke nightgown, small 34 or 36, medium 38 or 40, large 42 or 44 bust. With straight or

pointed sleeve edges. 7638 Four-gored petticoat, 22 to 32 waist. With or without plaited frill. 7981 Petticoat with straight lower edge, 22 to 32 waist. Designed for flouncing or bordered material.

8072 Fancy blouse, 34 to 42 bust. With or without chemisette, with long or short sleeves. 8078 Blouse in kimono style, 34 to 42 bust. With long or three-quarter sleeves. 7592 semi-princess gown, 34 to

42 bust. With two-piece skirt having inverted plaits at the sides, with or without chemisette and peplum, with set-in sleeves in three-quarter or full length. 8066 Two-piece skirt, 22 to 32 waist. With high or natural waist line. 8086 Two-piece skirt, 24 to 34 waist. With high or natural waist line. Price of each pattern 10 cents.

Southern Girl Farmers.

The field agents of the Department of Agriculture who are engaged in demonstration work among juvenile clubs in the South tell many stirring tales of the work done by Southern girls.

From Alabama came this story: "One girl who lives on top of a mountain cleared and fenced her own plot, dragging rails one at a time down the mountainside. As she lives alone with her grandmother, she had no one to plow for her, so she and her grandmother dug the plot up with a grubbing hoe. She split her ankle with the ax while chopping stakes for her plot."

This story came from an agent in Arkansas; "Etta, Ealy and Ora Red have moved on their own farm too late for early tomatoes. They have planted bunch beans, after which they will raise late tomatoes. Their father died in February, leaving the mother with eight children. These girls, with a fourteen-year-old brother, will run the farm. It seemed as if the father could have been the least spared of any man in the country.

"One little Arkansas girl, with the aid of her sister, used a small harrow, such as is used for cotton beds, to harrow the space between the rows of tomatoes in their canning club plot. One girl took the place of the horse in the harrow while the other occupied the place of the driver."

A report from Georgia says: "A little girl of Upatore deserves special mention. Her parents are poor but good people of fine sense. She went to school, stood at the head of her class; did all the work of her patch except plowing, working morning and evening; borrowed money for canner and cans and has put up 500 cans of tomatoes and 200 cans of blackberries, besides a variety of sauces, pickles, jellies and preserves for home and market purposes."

"Three-fourths of the members of the Girls' Tomato Clubs visited this week are regular 'hands' on their fathers' farms," writes an agent of South Carolina. "One girl is twelve years old and weighs 108 pounds. She told me she learned to plough two years ago, when her father was a cripple. She prepared her one-tenth acre with a two-horse plough, hauled her fertilizer, scattered, bedded, transplanted hoed and ploughed it without any help at all. When I went to her tomato garden, about a half mile from her home, I found it to be in a very productive state."

These reports ought to be quite comforting to the good ladies who always say, in the light of new feminine enterprise, "woman's place is in the home." All these girls stayed home and did work that we have grown to consider largely the man's share—like many a woman from the earliest dawn of history.

PICKLED CARROT.—This is fine served with salmon. Scrape, wash, cut lengthwise in strips. Cook in salted water till tender, then pack tight in cans. I use pint cans and stand carrots up, making two tiers in can, leaving space at top of can for two or three slices of lemon. Pour cold vinegar over and seal.

MRS. C. H. K.

Tommy Truckfarm: "Say, Ma, I'm awful glad you're done your wash. I want a lunch to go fishing with. Oh, what do you think—I was out lookin' at the chickens and that city girl pointed to a chicken and ast me if it laid an egg what would I do with it. I sez 'I'd send it to a museum. That chicken's a rooster.' Ain't you glad you heard about Fels-Naptha Soap and can get your work done so soon?"

Anty Drudge: "It looks to me like you're glad, too. Fels-Naptha is the friend of every one. I always keep a box on hand so's I'll be *sure* to have enough."

The Fels-Naptha way is the best way and the easiest way of doing all kinds of work.

The Fels-Naptha way is the cool-water, no hard-rubbing, time-saving way. For the weekly washing, for housecleaning, scouring greasy pots and pans, making china and glassware glisten, there is nothing so good as Fels-Naptha Soap in cool or lukewarm water.

Full directions on the red and green wrapper.

Better buy it by the carton or box.

Fels & Co., Philadelphia.

FELS-NAPTHA

Getting Meals for Company

Thanksgiving, Christmas and other holidays generally mean company and lots of extra work getting meals. If you had an

ENTERPRISE
Meat AND Food Chopper

you would be delighted and surprised to see how easy it is to get a meal for a large company. You can have the daintiest dishes—good things that tickle the palates of your guests—and yet they will be inexpensive. But it is for everyday use that this chopper pays for itself over and over again.

If you do any butchering, you will find it just the thing for chopping sausage meat. It is the one chopper that gives the chopping cut—does not squeeze, mangle or crush. It really CHOPS meat and other food, using a four-bladed knife that chops clean and fast. A minute is time enough to chop sufficient for a meal for a good-sized family. This chopper is without an equal. If you want a still lower-priced machine, ask to see the ENTERPRISE FOOD CHOPPER.

Costs from $1.25 to $2.25, according to size.

Send 4c for "The Enterprising Housekeeper," our new cook book. Full of good things to cook and know.

Go to your dealer and he can show you the ENTERPRISE line

THE ENTERPRISE MFG. CO. of PA.
Dept. 69 Philadelphia, Pa.

Pea Coal for Domestic Use.

Relating to pea coal for domestic use, I have used nothing else for two years in both range and steam heater, which have revolving grates. Starting with clean grates it is necessary to get a good bed of wood to prevent coal from dropping through the grate excessively. My practice, however, is never to clean the furnace of dead ashes, after a fire has gone out, either accidentally or purposely. There is always ample draft with a few inches of ash bed in the firepot. In raking fires it is only necessary to use a little care to avoid loss of coal, and I might add that a small amount of coal in the ash represents a very small offset to the saving effected by the use of pea coal, and it can be recovered by screening if desired. The fire in my steam-heater does not go out at all during the entire season. The range fire is not quite as constant, but the coal is not to blame—but the domestic in whose care the range is. The use of pea coal is undoubtedly a large economy—approximately 25% of the fuel cost in a home.

HERBERT C. WILLIAMS.

In the Fall of 1907 we moved from a medium-sized and modern house in the country, to a very large one that had been built years ago, with high ceilings and rooms much larger than ordinary, fitted with a hot air furnace, and we were informed by several persons that it was an impossibility to keep this house warm. Our coal dealer suggested that we try a ton of pea coal to bank the fire with at nights, and in this way save as much on the fuel bill as possible. Among other things he said that the pea coal was of even better quality on the average than the larger sizes, as the slates would not be as apt to break up as the good coal would, which looked reasonable, but in experience we have not been able to see anything that would bear out this statement. For about two or three nights we tried banking the furnace fire with the pea coal, but could see no advantage from its use and discontinued it. Along during the Spring, having used up our supply of chestnut coal for the kitchen range we decided to see what we could do with the pea, so as to get some return for our investment in it, not thinking of using it as regular fuel, but to our surprise we could not see any particular difference in amount consumed or results obtained. Our kitchen range is rarely out at night, as we find it cheaper to hold the fire, by closing the drafts than to let it out and light it again, but on an average of once in a month or two it will go out through forgetting to close the drafts at bedtime, and one of these times came along soon after starting the pea coal and we then learned a few things about it that may be of use to former inquirers.

We had always cleaned out the grate completely, and as it is a rotary one with a large space between the sections, we think it is as difficult a one as exists anywhere in which to burn the pea coal, but in our ignorance we lit the fire as usual with an average amount of wood for kindlings, and when burned to a point where the embers could be easily broken with the poker, put on the usual amount of coal, and in about 10 minutes, we had the whole business down in the ashpan under the grate. We went at it again, this time using more wood so as to get a bigger bed of coals, before putting on the pea coal, and with slightly better results, inasmuch as we got a fire over about half the grate, at first, which by careful manipulation was gradually made to cover the whole surface, but the way the coal would run out of a scuttle and down through that opening in the grate was about like shelled corn running out of a hole in a bag. As soon as the fire covered the whole grate there was no more trouble, and the next time we had to light it, we took a piece of sheet iron and slipped it in over the grate from the front, something that the construction of our range allows, but would not be possible in others, and since then we have made it a practice to leave enough of the old ashes on the grate to cover it about an inch thick, and have no more trouble in lighting it; in fact think it kindles quicker than the larger coal does. When the pea coal was used up we purchased another ton of chestnut, but did not like it as well as the pea, so went back to the pea again and have continued its use ever since. It must be clean and well screened; we have had just one ton of it that was filled with dirt and fine screenings to the extent of one-quarter of its bulk, and this it was impossible to burn; it would lie dead in the fire, and as our chimney has a strong draft, it suggests that where a chimney has a poor draft the pea coal might not give as good results as the larger sizes. Here we pay $5 for pea and $6.50 for chestnut so it seems that in a New Jersey housekeeper's case a trial would be well worth making, but she should see to it that the coal is clean and well screened, and that at no time is there less than an inch or two of either ashes or fire on top of grate, before adding coal and she will have no trouble in using the pea coal without any changes whatever to her range. To hold fire over night, we try to have the fire box about half full of coals that are burning briskly, and then at bedtime fill firebox up level full with coal, and close dampers and open check damper in upper front door, and there is very little coal consumed overnight. We usually fix fire at nine, and anywhere from six to eight next morning, by simply throwing wide all dampers, cook breakfast for family of seven without adding any more fuel to the fire than was put on it the night before. T. S.

What Aunt Sally Served to Guests.

"I've always been thankful for living in Aunt Sally's home, and that Aunt Sally's time wasn't the time of salads and mayonnaises and food frills and ruffles," said Uncle Billy.

"What would Aunt Sally do when guests came unexpectedly to her?"

Lots of them came that way, for she and Uncle Joe were very hospitable. They came to her in the stage or in big wagons drawn by horses; there were no trolley lines through the country then; no autobuses nor private horseless carriages. Her afternoon guests always came early and tea was always served early, while I, or Betty, who lived with Aunt Sally many years, started a fire in the cook stove in the shed or Summer kitchen, Aunt Sally would move about putting extra touches to the table, which was always laid in the cool darkened kitchen. Without any hurry—Aunt Sally was never hurried nor flustered—she would sift a quart of flour into her mixing bowl, a pinch of salt, half teaspoonful of soda, the same of cream of tartar. This she would moisten with a teacup of sour cream—putting part buttermilk if cream wasn't sour enough; stir lightly, roll on molding board and cut into biscuits handling as little as possible. In 20 minutes these would come from the oven the lightest, whitest, fluffiest things imaginable, and served with honey (they nearly always had honey at Uncle Joe's) they were "food for the gods."

What else? If she had cold potatoes left over from dinner—baked ones preferred—she would peel, cut in thin slices, pile in her "spider" with a sprinkling of salt and a good-sized piece of butter atop, and pour milk over it. She would set the "spider," covered, over—not down on the fire—and let warm through slowly but thoroughly when she would pour fresh cream over them and cut them (not mash them) down through with a knife. No potato salad that ever was concocted equalled Aunt Sally's creamed potatoes. Of course there were other things. A roll of pot cheese, eggs scrambled with dried beef or scrambled without beef, or hard boiled and peeled and laid on a platter. Fruit cake, months old, surreptitiously fetched from the box behind the parlor tete-a-tete, or jumbles which were hidden away from "the boys"—Uncle Joe was one of the boys—in a stone jar in the spare bedroom. And there was fruit, spiced, pickled, canned or fresh, products of the farm, and tea, and a glass pitcher of sparkling water from the well with the sweep bucket in it, and milk kept close to the cold spring in the cellar, and fresh rich buttermilk. The latter was usually served with ginger bread or johnny cake. Aunt Sally's johnny cake and apple sauce are worth another story. EVANGELINE.

We toil to make an outward show,
And only now and then reveal
How far the under currents flow
Of all we think and feel.
—John Nichol.

"I Will Trust You Gladly Wherever You Live" "I believe in every man who earns a living. Live Stock and Dairy

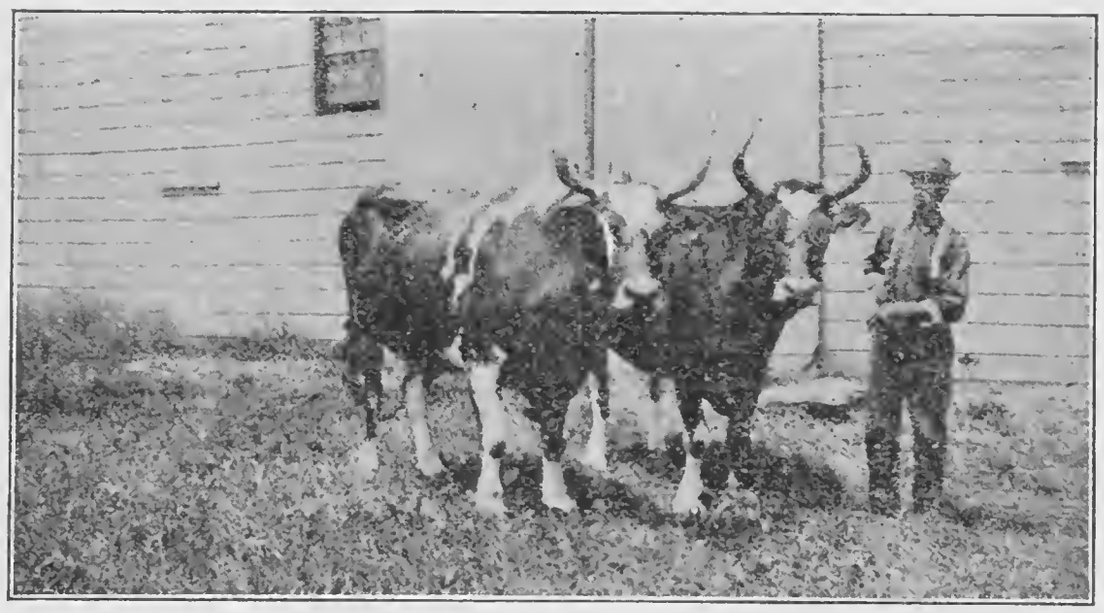
RAISING BEEF CATTLE.

In raising a special beef type of cattle, what use do they make of the cow after the calf is weaned? At the present prices of beef does it pay to keep a special beef breed, or would it pay better to have a good butter cow and make out of the extra cattle what one could for beef? J. W. F.

Where extensive beef cattle production is engaged in the calves are not weaned at an early age, as is the case where representatives of the dairy breeds are used. The calves usually run with the cows until they are a good size, often until they are eight or 10 months old. Especially is this practice true in case these



"TRUE YOKEFELLOWS."

calves are to be used for show yard purposes. An ordinary farm practice is to wean them at a younger age, and in case cows are capable of milking reasonable quantities, the cows are used for dairy purposes; with a strictly beef type, however, calves are weaned off as soon as they are able to provide for their own maintenance, and they are re-bred and the profits are based upon the value of the calf produced. The present prices of beef, and particularly of feeders, naturally brings to the mind of the Eastern farmer the advisability of engaging in beef production. It would seem good judgment to suggest that ordinarily it is a wrong time to go into the industry when prices are high, for usually a man is compelled to go out of such a business when the prices are low. However, if

ALL READY FOR A SPIN.

there is market for beef products in the inquirer's territory it would certainly be more economical to use the beef-making type rather than to endeavor to make beef out of representatives of the butter or milk breeds. The milk and beef type which is represented by the milking Short-horn is a useful type of animal for the Eastern farmer to consider as a source of milk and beef production. The industry is extensively developed in Pennsylvania, and it is only a question of time until the combination animals are going to invade the Eastern States.

F. C. M.

"WHY do so many young men leave the farm?" "Well," replied Farmer Corntossel, "in most of the cases I have observed it was because they couldn't earn their salt as farm hands an' wasn't fixed to pay board."—Washington Star.

AN OHIO BREEDING ASSOCIATION.

Can you give me information about the breeders' association of which I read in THE R. N.-Y.? I want instruction about how started, use, workings of it, etc.

Deerfield, Mass. L. L. G.

Community breeding which has so lately sprung into existence in America, is nothing more or less than the common practice of the breeders of Europe, who in sections and localities breed but one particular breed. This practice is carried on for several generations, until a county becomes noted for some particular breed, either sheep, cattle, or horses, although all three may be found in one restricted territory. This obtains on the Continent to a very great extent, crossing different breeds is about unknown in recognized breeding territory, and grades are quite as scarce. Exactly the reverse of this is the common practice in the United States, and while abroad they build up and strengthen the qualities of their stock, we in this country work quite as industriously to diffuse it by a general mixing of breeds. Thousands of dairymen are doing so, and complaining about the disappointments of their industry.

The community association inquired about by the correspondent is in Geauga Co., Northeastern Ohio, and is now composed of nearly 200 active members, all breeding purebred Holsteins, though some of them in part are breeding grades from the highest type bulls. The men who compose this society are farmers, using these fine cows to supply milk every day in the year to either Cleveland or Pittsburgh. There is, with one exception, no one who could be called a professional breeder. While the society has been in existence about seven years, the owning of Holstein cows by part of the members dates back twice that many years. Hugh Van Pelt, the noted dairy authority, recently said that nowhere in the world in 20 miles square, could so many superior Holsteins be found, one man owning four world's champion cows. Prof. Oscar Erf of the Ohio State University puts it as strongly, and what is the surprising thing of the whole matter is that until within a few years every man of the society was just an unknown dairyman. Now the name of Dan Dimock, Paul McNish, Knap and Pierce, and a score of others, are known the Holstein world round.

This society is very largely a gentleman's agreement affair. In it individual opinion and action is without restraint and the bi-monthly meetings of the society are very largely for conference, and the good of the society, to confer, and to receive the scores of men from half the world who now come here to buy, instead of going to Holland. Since the world's four champion cows hail from here, the visitors come more abundantly, and prices have gone up accordingly. Heifer calves 10 days old are quick sale at from $75 to $150, and other aged stock correspond.

This is agreed upon; all shall breed from the DeKol family. Line-breeding is the rule, and in places it is hard to draw the line where line-breeding stops, and inbreeding commences, and some of the most successful breeders of the highest priced stock, have not for years gone outside of their herds for fresh blood. It is this intense breeding that has given the four world's champions all to one herd.

Feeding, care, and discussing lines of breeding, make up the gist of these meetings. The best talent that can be secured, come for addresses about every three months. There are no hard or fast rules. Each member pays $1 annually for the regular expenses. The society has what might be called a "clearing house," supervised by three members who "warrant and defend" the sales of all stock, have an eye on prices, and attempt to secure equity between members and buyers as well and such other matters as fall upon them. The society usually has "consignment sales" each year, but as their sales of surplus stock this year will aggregate about 5,000 head of all ages, in the county to outside buyers, there was no stock left to consign, and the money brought into the section this one year of surplus stock alone will total over half a million dollars. It is figured that this community breeding has made the county richer by possibly over a million dollars in addition. Not all of the men who are breeding these valuable cows are members of the society, but are still patrons of it, buying fine stock, notably sires, and not a little good registered stock and grades go out from their herds, yet with the utmost good feeling on both sides, for in a way it is carrying out the community plan.

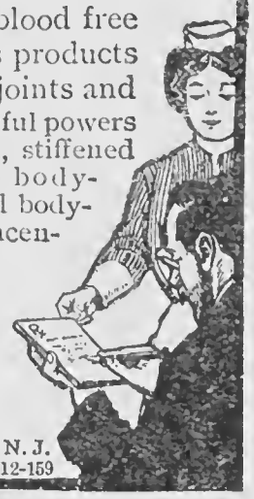
These are some of the things that have made this little society great, and sent their herds to Africa, South America, Japan, Cuba, Mexico, Central America, and scattered its representatives all over the United States as foundation stock. It is little wonder that its bi-monthly meetings are usually attended by hundreds of people from every section, sometimes a thousand, or more, and when they come, they find the everyday working farmers the owners of these herds, cows actually in use for commercial dairying, not being fitted for the showing, and when records and papers are wanted, they are produced, not promised for "future delivery." JOHN GOULD.

"WHAT makes you carry that horrible shriek machine for an automobile signal?" "For humane reasons," replied Mr. Chuggins. "If I can paralyze a person with fear, he will keep still, and I can run to one side of him."—Washington Star.

To Relieve Rheumatism

the body-waste producing uric acid must be gradually arrested and the blood purified.

Correct diet is essential. Abstain from tea and anything containing alcohol; eat meat only once a day and take SCOTT'S EMULSION which makes new blood free from the poisonous products which irritate the joints and muscles. Its wonderful powers relieve the enlarged, stiffened joints; and replace body-weakness with sound body-strength by its concentrated nourishing properties.



Physicians everywhere prescribe SCOTT'S EMULSION for Rheumatism.

Starting With Purebred Cattle.

The question many a young man has asked himself is this: "How can I start dairying with purebred registered stock with only a few hundred dollars?" Here is a young man's experience in the past six years. In April, 1907, he purchased a two-year-old heifer with a male calf by her side and half interest in a heifer calf, all for $100. He purchased the other half interest in the heifer and paid $30 to have the calf raised to one year old. He also gave the cow's milk and the male calf for the keeping of the cow the first year. The Spring of 1908 he rented a farm and took charge of his cow and heifer. On May 1 the same year the cow freshened with a heifer calf. The next Spring he had two cows to freshen but was unfortunate enough to get two male calves. The next year the same cows again freshened with male calves, but the two-year-old heifer freshened with a heifer calf, a granddaughter of one of the greatest herd sires of the world.

The Spring of 1912 fortune turned his way and each of his three cows freshened in her turn with a heifer calf. The following Fall he sold the four year old heifer and her Spring calf for $185. He then purchased two more cows, one eight and one seven years old, one for $100 (with one quarter of her udder gone) and the other straight and all right for $125. The former freshened with a heifer calf which sold at six months old for $85 and the new owner refused $115 a few days later and the cow sold this Fall for $125 (as Mrs. James Lampman said in one of her recent letters). The latter freshened with a male calf.

All male calves have been disposed of at good advantage and still the young man has nine head of Holstein registered females, the foundation cow, three daughters, three grand-daughters, and one great grand-daughter, and the cow which was purchased at $125.

His dairy is valued far above the original cost and increasing in value. He has been a member of the Holstein Friesian Association for the past three years. He intends to do some testing in future but has decided to let the cows do their own testing. MRS. A. L. CURTISS.

Ohio.

FARMERS' LAMB CLUBS.

The Department of Agriculture sends out a bulletin describing a method of selling lambs through coöperation. In 1883 the Goodlettsville Lamb Club was formed by farmers in Tennessee. These farmers found that by combining and selling their lambs in quantity they could obtain higher prices than when each farmer tried to handle a small lot. Starting with a dozen farmers the membership grew to 85. The plan of operation is quite simple. On April 1 the president calls a meeting and the members report the number of lambs and the weight of wool they can offer. Private sales are made up to April 1, but after that the members agree to sell together. When they know how much stock they have to handle the executive committee calls for bids as would be the case with any other class of merchandise. Here is a typical advertisement used in local papers:

Lambs For Sale.—The —— Lamb Club will sell by sealed bids about 800 lambs. Bids close May 20. Lambs are to be fat merchantable lambs weighing from 55 pounds up, and will be delivered from the 9th to the 12th of June. Club reserves the right to reject any or all bids. (Signed)————, Secretary.

If the bids are not satisfactory the club ships the lambs wherever it seems best to do so. In some cases they sell on futures or accept bids before the date of sale.

On the day of delivery the lambs begin to come in early in the morning in wagons or in flocks. The driven lambs are marked with bright colored paint which avoids confusion where flocks become mixed. Lambs are put upon the scales, which are handled by the executive committee. Lambs lacking in condition or weighing less than 60 pounds are discarded as culls. Comparatively few are thrown out, however, as the growers cull their lambs at the farm. Of the culls, the greater part are those lacking in age and of small size, but there are also some large ram lambs that have become what is locally known as "staggy." The president and one or two assistants weigh the lambs and credit each grower with his total weight. Delivery is commonly made before noon in time for loading. Payment is made on the day of delivery. The president or the executive committee pays the expenses, which are small, and apportions the balance among the members according to the number and weight actually delivered.

This plan of coöperative selling has paid these sheepmen. They have obtained more for their lambs and wool, and have been able to protect themselves in collecting their money.

The Robber Cow.

The Ohio Agricultural College spreads the news that some of the leading farmers of Gallia county, Ohio, are awakening to the possibilities of organized effort and coöperation. This has led them to form two coöperative organizations, the Gallia County Cow Testing Association and the Gallia County Buying Association. The same officers control both organizations, and one man can belong to both or only one. Each of the 25 men who are now in the Cow Testing Association pay $15 toward the expense of keeping a tester, and if more than 10 cows are being tested by a member, the cost is $1.50 per cow. Since there are 26 working days in the month, the tester is busy every day. One man found that one of his cows gave 1,165 pounds of milk in the month of November. The milk contained 60.75 pounds of butterfat which was sold for 33 cents per pound. The value of this and the skim-milk amounted to $23.97. The cost for feed was $6.80, leaving a profit of $17.17 for one cow for one month. This same man living on a 160-acre farm in Gallia County sold $1,500 worth of hogs during the year, and as much more was received for cream. This showing was made in a county where the soil is supposed to be poor. The activities of the association are also applied to the buying of fertilizers and feed. When orders are taken for the purchase of any large quantity of feed or fertilizer, each order must be accompanied by $2.00 in cash. When the fertilizer arrives the buyer takes it from the car and pays for it at that time. Should he refuse to take it he forfeits the $2. A saving of several dollars per ton is effected by such coöperative buying.

A Friend of Chester Whites.

Our experience with hogs is briefly as follows: We raised a few scrub hogs of no particular breed, for the purpose of letting them root up certain fields that we had planned to fertilize and plow later on. These scrubs not only did the work to our satisfaction, but actually and to our surprise showed us a good profit on our investment and care. We then decided that better hogs with better care would show better profits. After making inquiries about the different breeds from a number of good farmers in this section, we decided on the O. I. C. (which we subsequently found to be Chester Whites, for if they are bred together and their offspring eligible, we can see no difference though many farmers have a decided preference for one or the other).

As novices (not as breeders, but as breeders of hogs) we began breeding Chester Whites and O. I. C., bred from the best stock and bought from the best breeders in the business at good prices. Since then, considering investment, labor and all costs, they have been the most profitable venture in farming that we have ever had anything to do with, and we have bred horses, chickens and a few Jersey cows for over 25 years and have always bred pure stock. Our Chester Whites have in fact been profitable since the first six months after we began with them, and these profits have been creeping up all the time. As a breed, we have found the Chesters very prolific, and what is even more important, very good mothers, both as milkers and in being careful and kind with their pigs. We have found them quick growers, hardy, docile and easy to fatten. They are excellent foragers and do well on pasture. We have never had a sick (mature) hog on our farms, but have constantly used disinfectants and sanitary methods in caring for them. There has been a constant demand for Chester Whites, both as breeders and in our local markets, and not a week passes that some buyer doesn't stop at our farms for a breeder or for good pork.

Orange Co., N. Y. V. F.

SHETLAND PONIES
An unceasing source of pleasure and robust health to children. Safe and ideal playmates. Inexpensive to keep. Highest type. Complete outfits. Satisfaction guaranteed. Illustrated Catalogue. BELLE MEADE FARM, BOX 20, MARKHAM, VA.

JOHN B. WEBSTER, Dept. Y, Cortland, N. Y.

Purebred Registered
HOLSTEIN CATTLE

You can find no way to invest your money and effort so profitably as in the selection and use of a purebred Holstein sire of good individuality. In a few years' time you can grade up a very poor herd to a profitable basis.

The Illinois State Experiment Station has been testing a herd where the average production has been increased $41.65 per cow in four years by the use of a purebred sire, and by testing the individual cows and disposing of the poor producers.

AILING ANIMALS.

Lame Cow.

I have a young cow that has lately gone lame, seems to be sore in the shoulder, walks sore and stiff as if it might be rheumatism. Could you advise treatment? G. F. M.

Michigan.

It is quite impossible for one to determine the cause or location of mysterious lameness, without making a personal examination. Rheumatism is rare in young cattle and scarcely a likely cause of the lameness. Better make a careful examination of the foot. A. S. A.

Wound.

I have a mare that stumbled and cut her kneecap. The skin is off four inches square. I have been bathing it and using powder (disinfectant). Is it advisable to take the scab off every time I bathe it, or should I let the scab remain on the sore and what should I put on it?

Pennsylvania. N. M.

Make a lotion of one ounce of sugar of lead and six drams of sulphate of zinc, in one pint of soft water and apply this three times a day. Do not remove the scab, unless it is quite loose, or if pus is exuding from under the scab. Tie horse so that he can not lie down, or bump the knee. A. S. A.

Bog Spavin.

How shall I go about it to treat a bog spavin on a horse? The injury is of quite long standing. Will it be necessary to blister it so as to take the hide and hair off, or is there some better way known at present? I want to cure it so that she will go sound, and the joint is very sore now. P. N. G.

Bog spavin of long standing and causing lameness and soreness is practically incurable; but firing and blistering may be tried, together with a prolonged rest, and the "hide" need not be taken off, although the hair will have to be removed by clipping. Only an ignorant empiric would maltreat a horse by removing "hair and hide." Employ an up-to-date graduate veterinarian. A. S. A.

Wounded Horse.

I have an old mare injured with barbed wire in hind leg. The wound refuses to heal, and the horse limps increasingly. I am not working her now; she holds leg up, evidently in pain. The wound has proudflesh growth in it, bleeds and is a deep and ugly looking one. I have frequently bathed to keep clean and applied powdered alum. What can I do for it? C. D.

New York.

Cleanse the wound perfectly and when dry swab well with tincture of iodine and apply the iodine at intervals of twenty-four hours, for three days. Do this at noon. Night and morning on days iodine is used wet wound freely with a mixture of one ounce of sugar of lead and six drams of sulphate of zinc in a pint of water and after discontinuing the use of iodine tincture use the latter lotion several times a day until the wound heals. A. S. A.

Scours.

Can you tell me what to feed my calves to keep them from having scours? I feed separated milk. Start them on whole milk, then mix with separated milk. To begin I feed one quart three times a day and gradually increase. When they are two weeks old they are having two quarts three times a day. I keep them clean and spray with creolin and not one of them has escaped the scours. O. S. B.

New York.

Do not feed frothy milk. See that the milk utensils are perfectly scalded and sun dried. Contaminated feeding vessels commonly induce scours. The trouble probably starts there. Isolate a calf as soon as it starts to scour. Clean up, disinfect, whitewash, perfectly ventilate and sun light the calf pen. If you then have any trouble with scours mix one teaspoonful of the following mixture with each pint or pound of skim milk fed: Formeldehyde, half an ounce; distilled, or freshly boiled, water, fifteen and one half ounces; to be kept in an amber or yellow colored bottle to prevent chemical changes. Give the scouring calf a two or three ounce dose of castor oil, shaken up in milk, before starting the formaldehyde medicated milk. A. S. A.

Eczema.

I have a colt and filly that were three years old last June; they have run in pasture during Summer. Neither one has done well; the filly is completely covered all over her back and some down on her sides and legs with little bunches with scabs; pick off the scab and there is just a little pimple with moisture coming out of it. They do not rub much, but like to be rubbed or curried. The colt is not quite so bad, but has some sores. Can you tell me what it is and what to do for them. J. H. W.

New York.

Have the animals clipped at once; then wash affected parts of body with 1-100 solution of coal tar dip and repeat as often as found necessary. Give two drams of Fowler's solution of arsenic night and morning, after smaller doses have been given for a week; then continue the treatment until the animals are in good condition, at which stage the medicine may be discontinued, taking at least a week to the work. Feed roots or silage along with whole oats, wheat bran and mixed hay. Let the colts run out every day, unless in stormy weather. Blanket if stable is warm until coat has grown sufficiently to protect the animals. If you do not care to clip them wholly, clip the hair from the belly and from the legs above the knees and hocks. A. S. A.

Cough and Catarrh.

I have a horse 13 years old in good condition and feeling fine, but has had a cough and discharge of nose since June. Now his cough is somewhat better except that when he rolls or gets up he coughs, and sometimes discharges from nose. Let me know what to do for him to break up cough. P. E.

Pennsylvania.

On general principles have his teeth attended to by a graduate veterinarian who will make sure that a diseased tooth is not present and causing the discharge. This is scarcely probable, however, as you do not say that a bad-smelling discharge is present. It seems more likely that the old horse has a cold and cough. Wet all feed. Keep the stable clean and perfectly ventilated. Give half an ounce of Fowler's solution of arsenic night and morning until one quart has been used; then gradually discontinue the medicine, taking at least a week to the work. If the cough persists and is troublesome it might be relieved by giving one ounce of glyco-heroin three times a day. A. S. A.

Lameness.

I have a nine-year-old horse, which started to get lame beginning of July. I had a veterinarian who blistered the horse, and when he had stood at rest one week I took him out for a drive. He went pretty well for about one mile, but all of a sudden he went very lame and stiff. The veterinarian came the second time and again blistered the horse, and after a week's rest I drove him for a short distance; he again got lame and stiff. His trouble seems to be from the knee down and the right front of leg; as he walks he throws his foot out and walks very stiff. Could it be rheumatism? The veterinarian says no. The horse did very little work during the Summer. Can you advise me what to do? F. O.

New York.

Rheumatism would not be likely suddenly to lame a horse in the way described. The symptoms indicate high lameness; not in the leg below the knee. Possibly it is a case of embolism, from plugging of the artery. Have the veterinarian make an examination for that when the horse is suddenly attacked. Nothing can be determined when the lameness has subsided. Such a trouble would prove incurable. We are taking it for granted that the horse does not interfere, and at such times bruises the fetlock joint of the lame leg. In interfering cases special showing should be done by an expert and ankle boots should be worn. A. S. A.

Pigs With Cough.

We have several pigs, and among them we have noticed some coughing. Can you advise us what to do for them or what is the nature of their disease?

New Jersey. J. D. P.

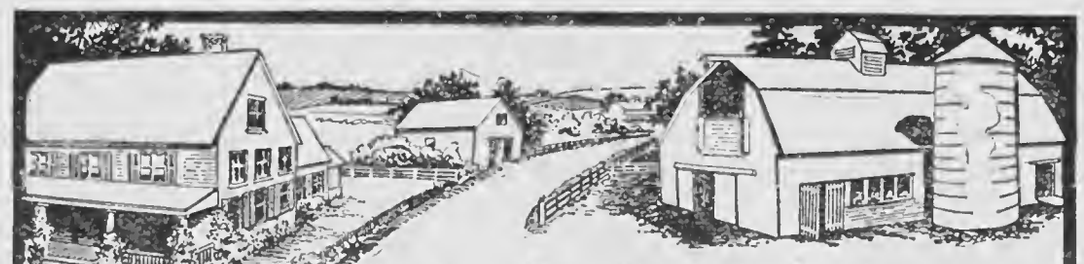
You do not state the age of the pigs or give particulars relative to their feeding or management. If they are little sucking pigs the cough may be due to dust in the bedding. This is a common cause, and often it leads to fatal pneumonia. Bedding for pigs should be as free from dust as possible and for that reason oat straw usually is a poor material. Shredded cornfodder will be found suitable, and next to it comes wheat and then rye straw. We have found that peanut straw is sometimes used in the South, and it has, to our knowledge, caused wholesale losses among little pigs. If the pigs are weaned and have run on pasture the cough is due to lung worms (strongylus paradoxus), for which pest there is no specific cure. Turpentine may be given in dram doses for each 80 pounds of body weight of pigs and continued for three consecutive days and repeated in two weeks or so if thought necessary. Some of the worms are free in the intestines and associated with other intestinal parasites, which are likely to be killed by the turpentine. Generous feeding is necessary to enable the pigs to withstand the ravages of the worms. Give them free range on clover, Alfalfa or rape; but keep them off old, contaminated pastures and especially from low-lying, wet pastures. Feed digester tankage at the rate of 10 per cent with other nutritious meals and grains in slop. Avoid contaminated drinking water and clean up, disinfect and whitewash the pens and houses. Also cleanse and sterilize all feeding and watering troughs and swill barrels. A. S. A.

Belgian Hares.

The question was recently whether Belgian hares pay where feed must be bought. I answer decidedly yes. For example, from October 1, 1913, up to the present date, I have sold 800 young rabbits for meat alone, say nothing of stock sold for breeding and pets. I have to buy every ounce of feed they eat, and my books show a fine profit if they are carried up to a system of feeding. C. E. H.

Warren, Ohio.

R. N.-Y.—There is little evidence in the markets that hares or tame rabbits would prove profitable except for a very limited trade.



The Profits in Progress

Farmers are learning the profitable fertilizer—the one that gives the best profit consistent with maintaining soil productiveness.

Progressive farmers are increasing, for all crops, the

POTASH

in their goods. Results have shown there should be at least as much Potash as Phosphoric Acid, for ordinary farm crops take from the soil from 2 to 4 times as much Potash as Phosphoric Acid. For potatoes, truck and fruit the Potash should be double the Phosphoric Acid.

If your dealer insists on carrying only low grade, 2% Potash goods, we will sell you Potash in any amount from one 200-pound bag up.

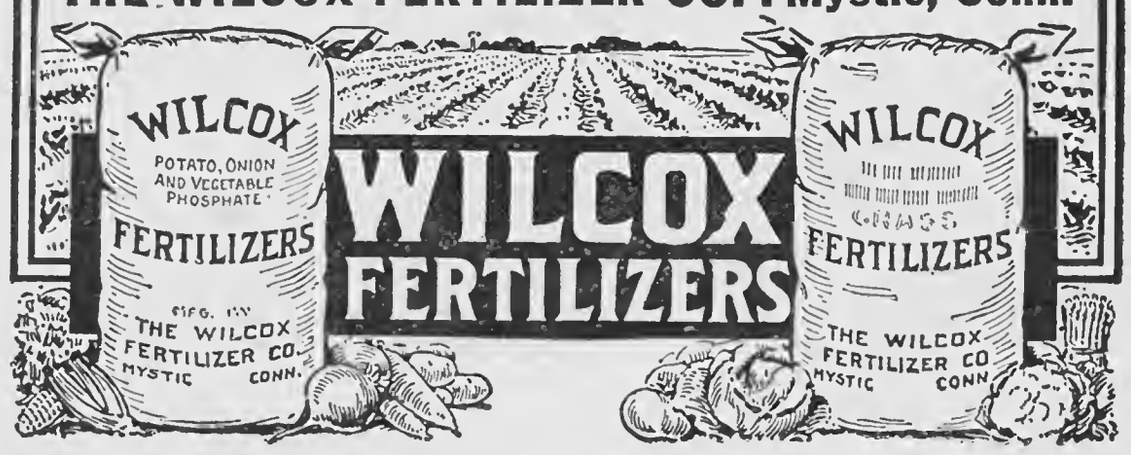
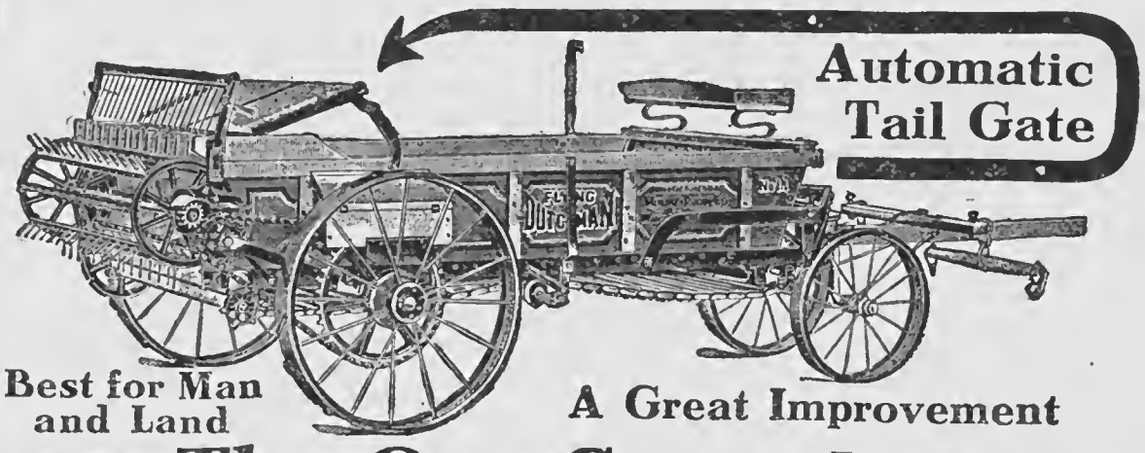
DON'T TRUST TO LUCK when Fertilizing

WILCOX FERTILIZERS—the fertilizers that fertilize—are not "lucky finds." They have been evolved after years of tedious laboratory and field experiments. They contain the materials recognized by science as being the best obtainable for producing bumper crops, yet leaving the soil in good condition for further tillage. Send today for our book.

THE WILCOX FERTILIZER CO. : Mystic, Conn.





The One Spreader Saves Strength of Manure

It is a well known fact that thin or liquid manure has the greatest fertilizing value—it is much more valuable to land than dry or rotten manure. The wetter it is, the better; every load of it is worth gold dollars to the farmer as soon as it is spread on his land.

There are many manure spreaders on the market today but they are so constructed that practically all of this valuable thin manure is wasted before it reaches the field.

The Flying Dutchman Spreader
NO. 14 NEW ENGLAND TYPE

is so constructed that it **saves** this material and enables the farmer to spread it just where he wants it.

It is a Low Down, Easy to Load, Endless Apron Spreader built with a **level** body and an **Automatic Tail Board** which prevent the thin manure from running out behind and wasting.

Load your spreader right from your barn, spread it while it is fresh and has its full liquid strength.

This spreader is unusually light draft, the rear wheels are **under the load** insuring perfect traction. It has steel frame, steel wheels, steel beater and the apron runs on three sets of hardened steel rollers.

It is very simple in construction—simple to operate—one lever does everything. A small boy can easily handle it.

Let us send our **Free Folder** and our 1914 Almanac. Write today.

Ask any **Flying Dutchman** Dealer about the **Flying Dutchman Spreader No. 14.**

A BELGIAN HARE MAN TALKS.

We often have questions about the profit in raising Belgian hares, or other tame rabbits. There have been many conflicting statements about the profit to be obtained from this kind of stock. We know of many people who started breeding these hares, only to give up the business in disgust, after meeting with serious loss and disappointment. Now and then, however, we meet people who come with the proof that they are making these animals pay. Mr. C. E. Hill of Ohio is a breeder of these rabbits, and he tells us something about the business.

What is the cost of feed for one good-sized doe?

Such a doe fed up to a system properly and regularly should have about one-half pint oats and bran in the morning. We mix 32 pounds of oats with 12 pounds of bran. The oats cost us 55 cents a bushel, and the bran 1½ cents a pound. At night each doe has half a pound of hay, or what she will eat up clean and not waste. At all times the rabbits should have plenty of pure water.

How many litters will a good doe handle in one year?

Five, and not overwork her.

How many young will she average?

There will be an average of seven, and with proper care she will raise an average of six.

What would be the first cost of a good doe?

All the way from $1.75 to $10, depending upon color, breeding and similar things. The average doe will cost about $2.50.

At what age age do you sell the young rabbits for meat?

At from six to 10 weeks old. We generally get 50 cents at six weeks, and 70 cents or a little more at 10 weeks.

This seems like a big statement to us, as such figures would make up a profit far in advance of even that claimed by the boom henmen or the cow wizards.

I can prove all my statements, and tell you where I sell the rabbits in four different cities.

Can anybody do it?

No, it would be nonsense to claim that. Can everybody make a fortune or even a living out of hens? Plenty of people start this rabbit business just as they start the chicken business.

What do you mean by that?

They buy one incubator, and perhaps a dozen eggs. They put the two together, and then go to bed, where they dream they have made a million dollars. By and by they wake up and find that they have got to get out into the cold and take care of their stock. Then they get that tired feeling, sell out for about 10% of what they paid, and say there is nothing to it. That's right, because they never put anything except money into it, and it takes brains and care to get money out.

You call the rabbit business a hard one then, do you?

A man must be two-thirds rabbit, and he can't raise hares simply by raising a beard. It is a business that takes time and care, lots of study, and kindly disposition, and the strictest attention to business.

Is there a demand in the city market for rabbit meat?

A bigger demand than you think. You may not know it, but many a time in the cities when you call for chicken in a pie, or similar meat dish, you get rabbit, and sometimes a poor quality of rabbit at that. A good, tender, quick grown Belgian hare is something to make a man well satisfied with life, and when you learn how to raise and sell them the satisfaction is double

Goats as Sheep Protectors.

More than 50 sheep have been killed in this vicinity during the past few weeks by dogs at night. I have heard that if a billygoat was placed in the lot with sheep he would defend the flock from the ravages of night-running dogs. Can you tell me whether this method of prevention has ever been resorted to? C. S. B.

Niverville, N. Y.

This plan has been tried, but not with full success. Some billygoats will fight hard and master a single dog, but these curs often run in packs and scatter the sheep so that the goat cannot protect them. We have one report of a flock of Angora goats, noted as good fighters, yet the dogs got in and killed many of the goats.

Our expert painting and decorating department is at your service. Its advice will be a source of great value and economy, and costs you nothing.

Painting is a big problem to those who want it done right.

For there is more to a good paint job than the paint and labor.

Knowledge of the surface to be painted and its correct treatment are of vital importance and often are the deciding factors in a good or bad job.

The kind of wood, the condition of its surface, when last painted, are facts that are as necessary to know as the choosing of the right paint and hiring of the right painter Our Service Department will give you information free for the proper treatment of contemplated painted surfaces based on knowledge supplied by you.

Just fill in the coupon. Send it to our Service Department. This valuable information and advice on how to treat and paint any surface correctly will be sent you by return mail.

Lucas Paints are, without any question of a doubt, the best paints to use. Thousands of farmers who have used millions of gallons advise it. Lead and oil mixtures or other ready mixted paints can't compare with it.

Every can contains 65 years of paint-making experience. The Lucas brains, equipment and facilities have developed in that time into the greatest paint-making organization. Every batch prepared must match, after rigid tests, the Lucas standard for color, weight, covering capacity, drying, and service The Lucas paint you get is the Lucas Standard.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Ration for Bull Calf.

I have bought a purebred Guernsey bull calf. I am told he will be no good for breeding, as he had no rudimentary teats. Is this true? Could you give me a feed that would force him along for service? He is 16 weeks old. How long before he is ready for service, and how much will it cost to get him registered?
Terryville, Conn. B. B.

The size of the rudimentaries on a young bull is of little consequence. Their location is considered more of a guide in determining the type of udder that might appear on the heifer calves sired by this particular bull. They should be located well apart, preferably in the form of a square or rectangle, and should not emanate from the same point. There seems to be a difference of opinion as to the importance of this index in the selection of a bull, and judgment suggests that the breeding of the bull and his individuality be limiting factors in his selection. The argument relating to the correlation between the shape of the udder appearing on heifer sired by bulls whose rudimentaries are placed in a certain way, can be both roved and disproved by considering a large number of cases. As relating to a useful ration for a growing bull I would suggest equal parts of crushed oats; wheat bran; cornmeal and distillery grains supplemented with Alfalfa or clover hay. The amount to feed would depend upon the age, size and vigor of the bull, enough being fed to keep the animal growing vigorously, yet he should not be padded with fat, especially if he is inactive and confined to the barn. Under average conditions of growth and development, a bull may be used for light service when twelve or fourteen months old. To use him at a younger age is a questionable practice, and it would be much better if his first service was delayed until he was fifteen months old.

The cost of registering a Guernsey bull with the American Guernsey Cattle Club is $1 to members and $2 to non-members of the club for each animal, provided sketches identifying color markings are filed with the Secretary, Wm. H. Caldwell at Peterboro, N. H. before the animal is 30 days old. Delays in making sketches are expensive, as the fee for registering an animal after he is one year old that has not been previously sketched, and the sketch placed on file is $10. Blanks and full information relative to the requirements of this breeders' association may be obtained by requesting same from the secretary.

F. C. MINKLER.

Ration for Young Cattle.

Will young cattle thrive and do well on roots, beets and turnips, alone, or with the addition of a few pounds of wheat bran daily, with but little roughage through the Winter? How much should two-year-olds have daily? C. B.
New Jersey.

Young cattle had best be fed in addition to such succulent feed as roots, beets and turnips, a grain mixture made up of cornmeal and wheat bran, utilizing a mixture of five parts cornmeal to two parts of wheat bran. Five pounds of this mixture to a heifer weighing 400 pounds would be about the right amount, provided she was given in addition all of the roughage that she would consume, and a reasonable amount, say 20 pounds, of any one of the root crops suggested. A two-year-old heifer might be appropriately fed six pounds of this mixture, which would insure rapid growth and good development. F. C. M.

Flax Straw for Fodder.

Is flax, cut green and not thrashed, good to feed milch cows and horses? Flax is full of seed. A. R.
Alpine, N. Y.

It is sometimes stated that flax straw is likely to form balls of undigested material in the stomach of animals eating it. According to my own observation this is not the case, and while I have known of several cases where flax straw was fed in moderation, I have never personally heard of any injury resulting therefrom. It must be remembered that the seed contains linseed oil, and fed in too large quantities, might be too laxative. Otherwise, I think it would be very good, especially for milch cows. C. L. M.

Ration for Freshening Cow.

We bought a cow in September that was to freshen this month. When we got her she gave about 10 pounds of milk to each milking and is still giving that amount. Is there any way of telling when she is to freshen? I feed about three quarts to each milking composed of ground oats, barley, bran, shorts and oil meal, also am feeding some carrots and oat hay. She loses milk from one of her teats. What can I do for this? She is a Jersey and Durham and gives very rich milk. How long ought a cow to be dry before becoming fresh? Would it be possible that she would not dry up?
Oregon. J. H. W.

I would advise, if possible, that you have some one who is familiar with cows look at your cow and give his opinion. Generally the calf can be quite plainly felt on the right side, back of the ribs and in front of the flank, rather low down. This is especially true after a cow has drank heartily, and at such times there is apt to be considerable motion. For a week or two before parturition a sinking down between the hip bones and tail is noticeable. As a general thing it is better for a cow to be dry for six or eight weeks but some cows refuse to do so. Your cow is evidently a good one, and gives very rich milk. The only remedy I know of for the leaking teat is to use a teat plug, which can be obtained from a dealer in veterinary supplies, or to paint the end of the teat after each milking with liquid collodion. If she leaks but little, let it alone.

C. L. M.

Fattening Yorkshire Hogs.

Reading about J. R., who could not fatten Yorkshire hogs, I want to tell you about mine. I bought two pigs six weeks old in April for $7. I fed them brown middlings and bran mixed, started on one pint of each, and increased monthly till I gave two quarts of each. When about 50 pounds each I started in to give all my fish scraps and a little middlings. About one month before killing I gave corn on cob twice a day and cold water and middlings once. I killed these hogs Dec. 20; the smallest weighed 260 pounds, and the largest we could not weigh on a 300-pound scale. Six weeks before killing I fed no fish scraps, and now there is no taste of any. These pigs, with the first cost, amounted to $35, and $2 for killing. I sold the small one at 12 cents, or $31.20. The large hog, over 300 pounds, cost me $5.80, and I keep it for myself. I think they did fairly good. Some say there is no money in keeping hogs here. A. C. K.
Long Island.

Effect of Silage on Butter.

Will you inform me regarding silage and its effects on butter? I am in favor of building a silo, but the neighbors say that it affects the butter, giving it a bad smell. J. B.
Napanock, N. Y.

Feeding reasonable quantities of good silage up to 30 pounds per day would not affect the butter. There might be a "bad smell" if the milk or cream were left too near the silage, so as to absorb some of its odors. These would not come to the butter through feeding.

Value of Silage.

Can you inform me what my this year's crop of silage would be worth per ton to sell? I am located in a thickly settled dairy section. I am about to sell my farm, reserving stock and fodder.
Jefferson Co., N. Y. E. C. M.

As often stated, silage for sale has a comparative value. Usually it is figured at about 35 per cent of the local price of hay in the barn. The feeding value may not correspond, but this is a fair statement of selling value.

Rye and Oats for Cow Feed.

Will rye sown with oats at the rate of one-half bushel of rye to two bushels of oats and ground with other grain for cow feed cause the cows to abort or injure them in any way? S. J. B.
Ohio.

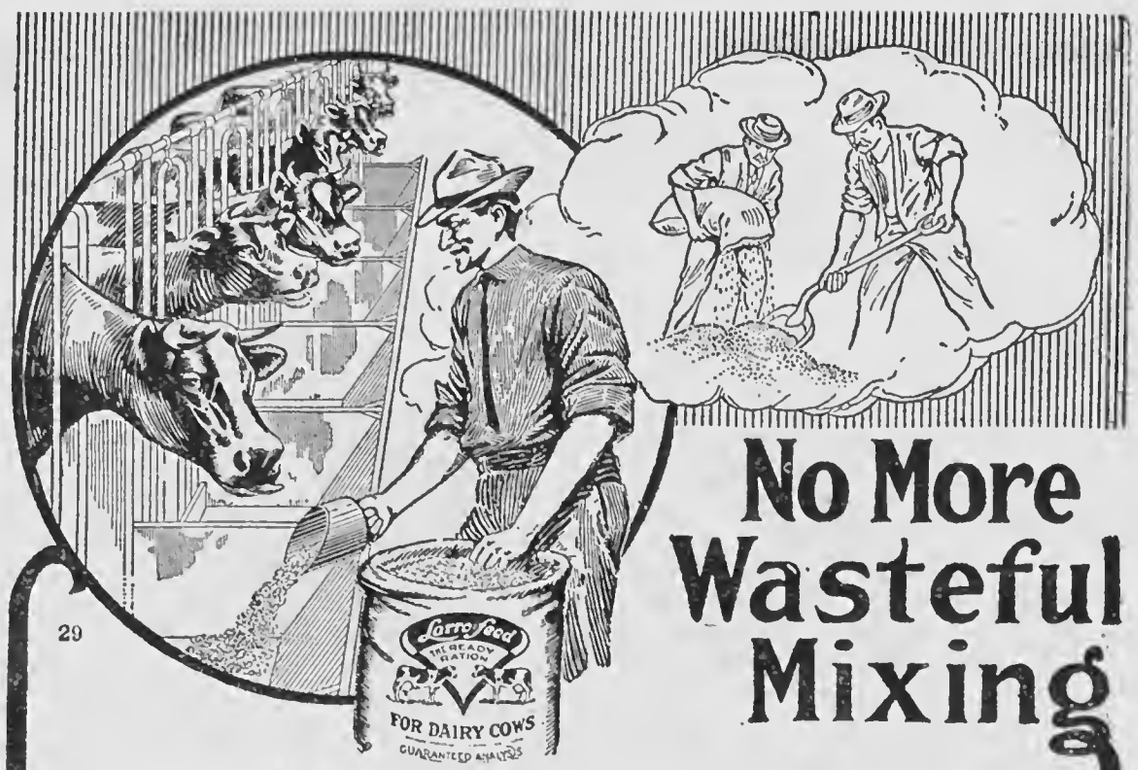
There would be little, if any, danger in your climate from ergot in the rye—which is what produces abortion. But why sow rye with oats? Canada field peas are much better—give a larger yield and are better for feeding.

SILAGE FOR HOGS.—Mature swine can utilize some corn silage to advantage. It is not sufficient ration in and of itself, but should supplement some more nitrogenous grain ration. It has a slight laxative effect, and is very good to form part of the ration for animals six months of age or older.

H. C. AND H. B. HARPENDING.

BERNIE BOSTON: "Shall we go and have a look at the apiary?" Marie Malaprop: "Gracious, no; I just detest those horrid monkeys."—Cornell Widow.

SON (a golf enthusiast): "You must acknowledge, father, that it requires a great deal of skill to drive a ball a hundred yards——" Old Farmer: "Shucks! It don't require half as much skill as it does to drive a pig fifty feet."—Boston Transcript.



No More Wasteful Mixing

LARRO-FEED comes ready to put right into your cow's manger. Why have you ever mixed up a ration yourself? Probably you thought that you'd get a lot of oat hulls, ground cobs or other "fillers" in any prepared feed. Such stuff used to be and still is in some feeds, that's true—but never in LARRO-FEED.

Larro-feed

contains absolutely nothing that *you* wouldn't want to put into a ration if you mixed it at home. It contains Dried Beet Pulp, cottonseed meal, gluten feed, distillers' grains, wheat bran, wheat middlings and a little salt—that's all. Every carload of ingredients and every batch of feed is analyzed, so that LARRO-FEED is always uniform. That's why we can dare to make this famous Larrowe Guarantee: "Feed 200 lbs. to any one cow—if results don't convince you that it's the best feed you've ever used, we agree to refund every cent of your money." Read that Guarantee again—and then ask your dealer for a trial lot of this wonderful feed. Large free sample mailed on application.

Ask also about Larro-Mash for laying hens and those that should lay but won't.

The Larrowe Milling Co. 329 Gillespie Bldg. **Detroit, Mich.**

"Bill" Says—

"Don't kill the Calf—feed it SUGAROTA CALF MEAL!"

"Bill" Is Right.

Because you can't afford to raise calves on milk is no reason for killing them, and suffer a loss where you *could* make a profit.

Sugarota CALF MEAL

MAKES BIG, STRONG CALVES

by supplying them, at considerably less than cost of whole milk, every requisite for steady, healthy growth. This enables you to make a profit on both your calves and your milk. SUGAROTA CALF MEAL is positively guaranteed. Write us if your dealer can't supply you. 2

LIVE STOCK NOTES.

Why I Keep Holsteins.

We bred one of the smaller breeds of dairy cattle for a number of years, and our losses were, we thought, too heavy. The calves at birth were delicate and often subject to disease, and the local market for surplus bulls was practically nothing. We first started with the grade Holsteins, and their milk and butter production was much more than others had been, besides they had larger and stronger calves, and surplus cattle were always in demand at satisfactory prices. After a few years with the grades we put on some purebreds and have been more than pleased; with over 75 purebred calves dropped, we have not yet lost a single one. The cattle are very strong, good feeders and we found less unprofitable animals than we found with other breeds. The Holstein bull calves are ready sale at from $50 to $100 each when from one to six months of age. This of course only applies to calves from untested or small record cows. If good bulls are used, and it certainly does not pay to use any other kind on purebred cows, the bulls from large record cows are always in demand at good prices. They are of course very quiet, pleasant cattle to handle, and when they have served their usefulness at the pail they will bring something for beef, we having sold some recently weighing from 1,500 to 1,700 pounds. I have yet to find the man in this section who ever started with Holsteins now keeping one of the smaller breeds, and if properly grown (the first year of their life) they will make money for their owner. At the prices good young clean straight Holsteins are bringing at public auctions by the thousand and have for the past eight or 10 years, there is no question that there is money in breeding them. A. G. DANKS.

Warren Co., N. J.

Storing Butter.

Can I store butter away for future use? Just now I am getting more than I need, so would like to store some away.

Sandy Hook, Conn. J. S.

I think the only method of keeping butter satisfactorily through hot weather is to put it into some kind of cold storage where the temperature is not far from freezing point. When this cannot be done, perhaps the next best method is to pack it in stone crocks, after salting it as heavily as your taste will allow, cover the surface with a cloth, over which is sprinkled a good layer of salt, and store in the coolest part of the cellar. I have often eaten butter stored for several months in this way, but to my taste it could hardly be called the "golden head of the staff of life." C. L. M.

Co-operative Live Stock Improvement.

A bulletin from the United States Department of Agriculture says: "The Portage County (Ohio) Improvement Association, which was organized less than a year ago, now has more than 3,000 members. The County Agricultural Advisor, was recently designated to select a number of purebred animals for breeding purposes. The dairy interests predominate; and the agent was guided by the needs of respective communities he was serving. In all 33 registered bulls were purchased, 22 being Holsteins, seven Guernseys and four Jerseys. He also selected four purebred Percheron stallions and one Belgian. The farmers were assisted in organizing a semi-annual stock sales day. The first sale, which has just been held, was thoroughly advertised, and was in the hands of competent auctioneers. The offerings were quite large and exchanged hands to a considerable extent among the farmers of the county. Through these two agencies every part of the county is within easy access of a high-class sire for herd improvement, and is also afforded a convenient and economical method for disposing of surplus stock; two factors of fundamental importance in live stock development.

Purebred Swine for Poor Men.

I have read an article on page 1309 with great interest. I am just a beginner in raising and breeding swine. One year ago I started to study the breeds. I have taken a fancy to the Poland China; I feel satisfied that they are the poor man's pig, as they are easy feeders, mature in due time, and are fairly good breeders; farrow with little or no trouble, and are noted as good mothers. I have a registered boar, and the dam is registered. My neighbor had a litter of pigs from a scrub sow bred to my registered boar, for which I claimed a pig at the age of six weeks. He received $6 per pair at six weeks old. I had a litter of purebred stock which I sold for $10 at the same age; therefore I gained $4 per pair over the price of common stock, which shows the difference in scrub and purebred stock. Without wishing to differ with Mr. Black on the question of the Chester White, as they no doubt equal to or surpass the Poland China, as to the production of pork the Poland China looks good to me. The pigs also produce a fair quantity of lard, but are more of a bacon type, but can be made to fatten at quick notice. I am only young in the business and like many others have much to learn. G. E. S.

Mauch Chunk, Pa.

PREVENTING BUTTER FROM STICKING.—Replying to a late inquiry how to prevent a butter print from sticking, keep the print in cold brine all the time when not in use. F. O.

Castleton, N. Y.

COMPUTING PROFITS.—I notice that many farmers use the word "profit" rather loosely, since they place everything except money expended for feed under that heading, their own time and use of their buildings being apparently worth nothing. As an example I would cite the reports of the productiveness of certain sows which were given. To such I would like to recommend the report of Mr. Sidmore, "The Cost of an Oat Crop," page 1318, as a model by which to go. W. J. M.

GUERNSEY CATTLE NOTES.—At the recent meeting of the American Guernsey Cattle Club in Chicago, a report of the Club's work for the first five months of the fiscal year show a great gain in the growth of Guernsey interests. More bulls and cows and a large number more transfers have been received than during a similar period last year. The work of 942 cows is being followed in the Advanced Register. These represent 155 breeders; 2,636 cows average 8,465.40 pounds milk and 423.53 butterfat, with an average per cent of 5.003. A summary of the cattle under test showed a large majority of the breeders (122 as compared with 26) were using the two-day test period with their animals.

SILAGE FOR BEEF.—The high price of beef is starting farmers into two lines of thought. One is hunting for grain mixture which will partly take the place of milk in calf feeding—the other experimenting with silage for beef feeding. The following is printed by the Wisconsin Agricultural College: "As men make new discoveries to meet new economic conditions, so, when all kinds of food stuffs advanced in price, did the stockmen begin to look around for a feed that would lower the cost of feeding cattle for the market. They found the solution of this problem in silage, for after a series of tests made by experiment stations and by the stockmen themselves, it was found that when silage was mixed with a ration it considerably lowered the cost of gains. Just as silage for a long time has been considered necessary for profitable dairying, so it is now beginning to be considered as a necessity for the economic production of beef both on the farms of the Middle West and on the ranches of the West and Southwest."

The Henyard.

Leg Weakness in Pullets.

What is the matter with my pullets? They seem well and healthy and all at once they go lame in one leg, and then the other; then they get helpless and drop and die. Yesterday one laid her first egg and she became helpless and cannot walk. I have never had anything like it. J. S. C.

Ohio.

I cannot be certain as to the cause of the leg weakness in your pullets from the very limited amount of information which you give. Rheumatism, from cold, damp, drafty, quarters is a frequent cause of lameness and inability to use the legs, but it should not be followed by immediate death. If the trouble from which your pullets are suffering is fatal, as your letter indicates, there is something wrong which only complete knowledge of all conditions would reveal. M. B. D.

Ration for Fattening Poultry.

What is best to feed young poultry to fatten quickly? Which should be used, sweet milk or sour milk to get better results and why? It is understood we have the poultry in sanitary coops. Many use sour milk; and is that better, and why? H. M.

Boonville, Ind.

The Cornell fattening ration is composed of the following: 100 pounds cornmeal; 100 pounds buckwheat middlings; 100 pounds oat flour, or flour middlings; 30 pounds beef scrap, and one pound charcoal. These are thoroughly mixed and about 12 hours before use the desired quantity is made into a porridge with sour skim-milk or buttermilk; 10 pounds of feed requiring from seven to nine quarts of milk. Feed fattening stock three times daily, confining them to fattening crates or in small runs. Give only as much as they will quickly clean up and do not attempt to force them in this way for more than about two weeks. Another fattening ration recommended by the Maine Station is: 100 pounds cornmeal; 100 pounds wheat middlings; and 40 pounds of meat meal. Still another is: 100 pounds cornmeal; 80 pounds wheat middlings; 20 pounds meat meal; and 20 pounds oatmeal (Ontario Agricultural College). Soured milk gives better results with fattening mixtures than water, doubtless because of the beneficial effect of the lactic acid contained as well as because of its food value.

Washing a Bird for Exhibition.

What is the right way to prepare a bird for a poultry show? B. A. B.

Findlay, O.

For show purposes white birds should usually be washed unless they are exceptionally clean themselves. All birds, however, should have their legs and feet soaked in warm water and with a blunt toothpick all dirt should be cleaned from under the edges of the scales on the legs and feet. Often many of the old scales on the shanks can be worked loose with the thumb nail. That is about all that needs to be done, but white birds need washing. The washing of birds requires a lot of patience and thoroughness in the work, and if one is not willing to give this, the probability is the birds will look worse after washing than before. There should be four tubs of water. The temperature of the first should be about 100 degrees. The others should gradually cool off until the fourth tub is about 70. After immersing the bird by grasping the legs and tips of both wings in one hand, as soon as it becomes quiet, loosen up carefully the feathers on all parts of the body and let the water soak clear into the skin everywhere. Then with a cake of white soap begin to rub the bird's back and body in the same way the feathers lie, rather easily at first, but after the feathers get soaked and the soap begins to make them pliable, they can be rubbed more vigorously. After a minute or two in the water they can be scrubbed with a cake of soap. The base of the tail near the oil sac and the fluff under the vent are the parts that need washing most. Every bit of dirt everywhere in the bird must be loosened if she is to look well when finished. After scrubbing the bird and getting the soapsuds into the skin on every part of the body and every bit of dirt loosened up and removed, the bird should be transferred to the second tub for rinsing. However, the same movements should be gone through, and all soap removed from all the feathers of the wings and tail and all over the body. The third tub is also a rinsing tub, and when taken out of the third tub, the bird should be absolutely clean. The fourth tub should have some bluing in it and the bird be rinsed a little more. The drying of the bird is almost as important as the washing. It should be wrung out as dry as possibly with the hands and allowed to flutter by tossing it up into the air gently and catching it before it touches the ground. In this way the bird will shake much of the water left in the feathers out. It should then be placed in a clean coop with clean shavings where the temperature is about 90 degrees. After staying there three or four hours, the temperature should be lowered gradually in order that the bird shall not catch cold.

A. L. CLARK.

Let Me Help You Get Winter Eggs

GILBERT HESS, Dr. of Medicine, Dr. of Veterinary Science.

I make my biggest egg profits in the winter months, because I see to it that my own hens lay regularly then. You can make your hens lay in winter the same as mine do.

Under ordinary winter conditions hens lay poorly, because they are cooped up, deprived of green stuff and cannot get exercise. The egg organs consequently become sluggish and inactive and the hen puts on fat instead of converting her ration into eggs. Hens must have a tonic during winter to tone them up, invigorate the dormant egg organs and keep them healthy.

Dr. Hess Poultry PAN-A-CE-A

is just such a tonic. It makes hens lay. It contains ingredients for toning up the whole digestive system and enriching the blood. The U. S. Dispensatory and all noted veterinarians certify each ingredient to do what I claim for it. Pan-a-ce-a is a scientific preparation—back of it is my 25 years' experience as a doctor of medicine, veterinary scientist and successful poultry raiser. But I don't want you to try my Pan-a-ce-a on anybody's claim or say so, but on a

Money-Back Guarantee

So sure am I that Dr. Hess Poultry Pan-a-ce-a will make your hens lay during winter, that I have authorized your dealer to supply you with enough to feed your whole flock, and if it does not do as I claim, return the empty packages and get your money back. Pan-a-ce-a is never sold by peddlers, only by reliable dealers whom you know. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50. Except in Canada and the far West. Send for my new poultry book—it's a stunner and it's free.

Send 2c stamp for my brand-new 32-page poultry book—it's a stunner.

Dr. Hess Stock Tonic

Your cows, horses and hogs are pretty apt to get out of fix during winter, because grain, hay and fodder do not contain the natural laxatives and tonics so abundantly supplied in grass. Lack of exercise is another thing that retards good health.

Dr. Hess Stock Tonic contains tonics that improve the appetite and tone up the digestion, laxatives for regulating the bowels, and vermifuges that will positively expel worms. I guarantee it. 25-lb. pail $1.60; 100-lb. sack $5.00. Smaller packages as low as 50c. Except in Canada, the far West and the South.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks or if kept in the dustbath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c, 3 lbs. 60c. Except in Canada and the far West. I guarantee it.

This service is free to all subscribers and their families. Make frequent use of it, and begin at any time.

THE EGG-LAYING CONTEST.

Egg production continues to increase; the gain during the sixth week is 121 eggs. Last week the gain over the previous week was 136; 962 eggs were laid this week, and the total to date is 3,937. Tom Barron's White Wyandottes laid 49 eggs during the week, taking first place. His total is 199. Neale Bros. pen of White Wyandottes are second with a score of 42. Francis F. Lincoln's White Leghorns are third with a score of 41; their total is 213, the leading score; 14 eggs ahead of Barron's White Wyandottes. The race between the Leghorns and Wyandottes from now on, will be interesting to watch. My money is on Barron's White Wyandottes. Having shown what he can do with Leghorns, I think Mr. Barron is going to show this year that he can beat us with an American breed. He breeds also Buff Wyandottes and Buff P. Rocks; both of these have taken premiums at egg-laying contests in England.

A peculiar thing is happening at the Storrs contest; many birds have begun to molt. In the pen from Braeside Poultry Farm seven of the ten birds are molting; in Chas Heigl's pen eight of the 10 are molting; 20 of the White Leghorn pens contain birds that are molting. There are molting birds also among the White P. Rocks, Buff P. Rocks, Rose and S. C. R. I. Reds, White Orpingtons, and even among the "dunghills." This is partly due to birds having been hatched too early, and that started laying some time before the contest began. But there are other reasons. Birds that had been laying stopped when moved to new surroundings; then the abundant and stimulating feed started the production of feathers. This may be only a partial molt, if it is a full molt, then no eggs may be expected from these birds for 60 to 90 days. Weather conditions also affect fowls to much greater extent than is usually thought; and this moulting may be partly due to that. But whatever it is due to, it will teach us the lesson that considerable care and skill are required to bring fowls to the point where they will begin laying near to a certain date, and be sufficiently well nourished just prior to that date, so that the yolks will mature rapidly and keep them laying. Dividing the total number of eggs laid by each breed, by the number of pens, shows the White Wyandottes far in the lead of any other breed. Their pen average is 128.8. The pen average of the White Leghorns is 65.6; of the Barred Rocks it is 44.5, of the Buff Rocks it is 27; of the S. C. R. I. Reds it is 35.4; of the R. C. R. I. Reds it is 67; of the White P. Rocks it is 7.

This goes to show that there are some extra good laying pens among the White Wyandottes, in fact there is only one poor laying pen among them. Taking out that pen the average for all the other pens would be 155.6. A few of the leading pens are given below:

	Week	Total

Sixteen pens have not yet laid an egg.

GEO. A. COSGROVE.

An Incubation Experiment.

I have two incubators, 100 and 200-egg. I get 8 to 10 duck eggs each day. I shall not keep them over eight days. I start incubator in January, fill 100-egg machine, test out in seven days, date them and put them in 200-egg machine; fill 100 egg machine again, test out in seven days, date them and place them also in 200-egg machine and then continue. During the hatching season, each 28 days will take off ducklings and replace with tested eggs from small machine. Can an arrangement of this kind be made a success? P. A. B.

Benton Harbor, Mich.

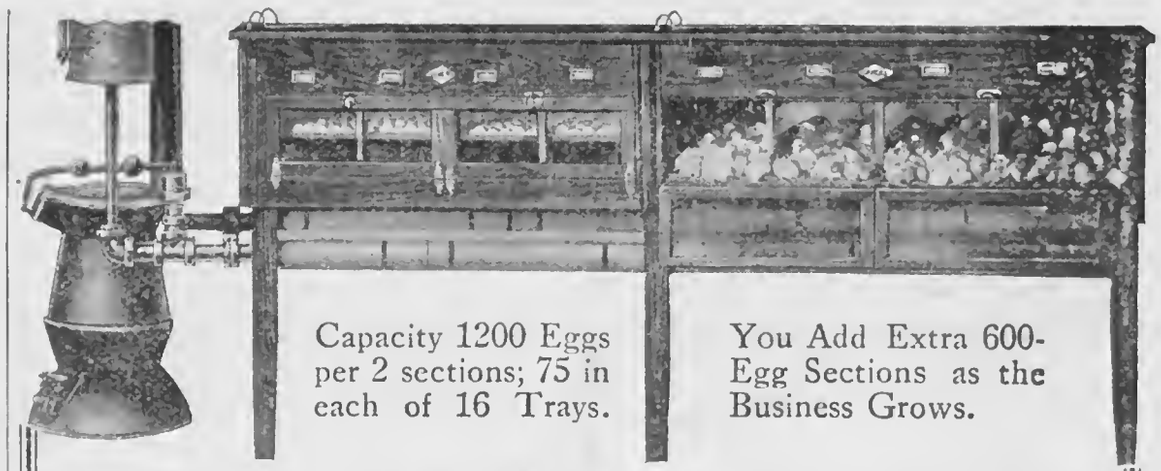
I think not. If I understand your plan, you would have considerably more than 200 eggs in your large incubator at the beginning of the fourth week for the first lot. More than this, you would have hatching ducklings and eggs at all stages of incubation in the large machine at the same time, making it impossible to keep the temperature at the right point. The animal heat given off when eggs are hatching produces a high and irregular temperature that would be detrimental to the younger eggs. So far as I know, continuous hatching in a single compartment incubator is not practicable and is not practiced. M. B. D.

Hen Ailments.

Would you give a list of hen distempers and their remedies, dose of remedy to the quart of drinking water? P. D. H.

New York.

A list of hen disorders, with enough of a description to make them recognizable, and an outline of their treatment, would occupy about all the space in one issue of THE R. N.-Y. As a rule, the ax is the best "treatment" for a sick fowl, as the time and labor consumed in treatment and the risk run of having the disease communicated to the healthy members of the flock are greater than the value of the bird. There are times, however, when a fowl of more than ordinary value may well be given special consideration. M. B. D.



Capacity 1200 Eggs per 2 sections; 75 in each of 16 Trays.

You Add Extra 600-Egg Sections as the Business Grows.

$1056 Profit in 126 Days in a 6600-Egg Machine; $1584 in 189 Days

By Hatching Eggs for Other People and by Selling Baby Chicks

Add to that the extra profit in hatching stronger, sturdier chicks to sell or to raise yourself, and you will understand why some **Poultry Raising Farmers** make more money from **Poultry** than they do from their **Fruits, Grain, Hay or Dairy.**

The Government reports show that poultry and eggs sell for more money than the wheat crop does. Every farmer cannot be a big grower of wheat but he can be a big producer of poultry and eggs and Baby Chicks with a

CANDEE INCUBATOR

Hot Water Sectional—Automatic

All that is needed is a clean cellar or basement. Each outfit comes in sections all built so that any handy man can set it up in a few hours. There is no danger from fire because the heater burns coal—safe as a kitchen range. Oil lamps are done away with. It takes five minutes to put coal on night and morning, at a cost of a few cents a day. Each 300-egg compartment is a separate machine with its own automatic thermostat regulator. Besides, there is an automatic regulator on the heater. ***This Uniform Hot Water Heat hatches stronger, sturdier chicks. It does not destroy oxygen as lamp heat does.***

Any boy or girl or farmer's wife who has an hour or so a day can run the entire system. You can start with two sections and add extra sections as your business grows.

There are thousands of Candee Incubators, ranging from 1200-Egg capacity, to 20,400-egg capacity, in use in this country. Nearly all of these systems hatch eggs for other people. There is room in every farming community for a custom hatchery. There is big demand for Baby Chicks.

If you are the one who is interested, write us, We will send you a book that tells you how to start a Custom Hatchery Business. Write today. You can start *early* with this outfit.

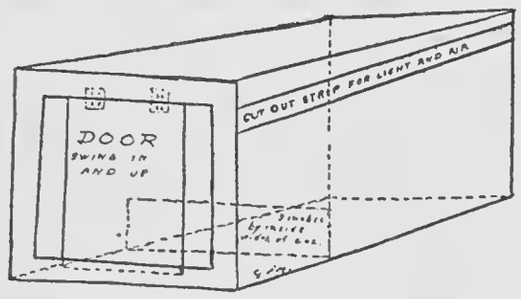
The Henyard.

Trap Nests Under Dropping Board.

Trap nests, unless placed under the dropping boards, are apt to form tempting roosting places for the fowls, if they are not capped in some way so that the fowls cannot obtain a footing on them. Nests under dropping boards are generally arranged so that hens enter from the rear, and provision is made to gather the eggs from the front. With the trap-nest, however, the hen enters from the front and is removed the same way.

There are many good nests on the market ready built, but a tier of serviceable traps can be built from cracker boxes if you have small fowls, or match boxes for the larger fowls. Remove from each side of the box, near the top, a strip of wood an inch wide. This will admit light and air. From one end of the box, which we will now call the front, cut a square opening a little larger than the hen that is to use it. Take the material sawed from the front and make a door hinged at the top and so hung that it will swing very easily inward but not at all outward. If a strip 1½ inches wide be cut from each side of this door the hen will open it herself on seeing the



CRACKER BOX TRAP NEST.

egg inside. Eight inches back from the front, across the bottom of the box, nail an upright strip three inches high. Back of this put the straw and nest egg. If the door be made solid it will have to be propped open by a short stick set under one edge. The hen will then enter and in stepping over the partition raise the door a little, dropping the stick and permitting the door to close behind her. In arranging a nest of this sort under the dropping boards, do not forget to place a three or four-inch board a little in front of and level with the bottom of the nest for the hen to fly up to from the floor.

Have all fowls banded with numbered bands that will stay put. When a hen had laid she will stand in the front part of the box waiting to be removed. Do this by raising the door with one hand and allowing the hen to walk into your other hand to have her number noted. Not over one egg in five hundred will be broken by the hens in this kind of a nest.

Michigan. P. L. W.

Eliminating Non-layers by Examination.

In a recent issue of THE R. N.-Y. M. B. D., in answering an inquiry about the condition of the pelvic bones in fowls he had bought for breeders, passes over rather lightly what is a very important means of telling whether hens are laying or not, whether they ever have laid or are, or have been, prolific layers of large eggs. Because this physiological knowledge was sold at absurd prices, and claimed to be an infallible test of the fecundity of the hens, need not relegate the large amount of useful truth in it to the discard, especially as it is of financial importance to be able to cull out all non-laying pullets in January and sell them as roasting chickens, thus cutting down feed bills and converting non-profitable producers into cash, and again in June I sell off all hens that have stopped laying except those to be carried over as breeders. A pullet that has never laid has the end of the pelvic bones rigid and close together. The orifice of the vent is yellow, and closely contracted. When she starts to lay the cartilage joint of the pelvic bones becomes soft and elastic, allowing the tips of these bones to spread apart easily, and leaving a space between these tips of the width of two or three finger tips. The vent becomes moist, easily opened and showing the mucous lining to be dark pink and quite moist. Given these conditions we can state quite positively that she is laying, as we can say in a cow where the pelvic bones become loose and settle that she will soon drop a calf. After the hen has laid out and is sitting, resting or moulting the mucous membrane becomes paler, and the pelvic bones become more rigid, and settle with the points nearer together, but never lose the unmistakable evidence that she has laid. The distance between the pelvic bones and the size and elasticity of the mucous lining of the vent determine whether she lays a large or a small egg. BUCHANAN BURR.

Line-breeding in Poultry.

What is line-breeding in fowls, and how is it carried on? W. A. ALLEN.

Bridgeport, O.

Line or inbreeding consists in mating animals to their own near kin, instead of going outside the family for new blood. The distinction between line, and inbreeding is not clearly made, but inbreeding is, perhaps, usually understood as mating sire or dam to their direct descendants, as daughter, granddaughter, etc., or son, grandson, and great-grandson in the case of females. Line breeding would, then, be mating animals of less close degree of relationship, but still belonging to the same family; as cousins, uncle and niece, etc. A flock of fowls into which no new blood is introduced from year to year is said to be inbred, as all members of the flock quickly become closely related.

Pekin Ducks vs. White Leghorns.

Once more, is there money in hens? From experiment station results and from the records of practical poultrymen who keep close tab on their expenditures, it would seem to cost from $1.80 to $2.10 to feed a hen a year, at the present cost of feeds. And this too when purchasing supplies in fairly large quantities. Now if a fair commercial yield is 120 eggs per year, at say an average price of 30 cents per dozen, where is the labor income when such factors as interest, depreciation extra help, repairs and losses of various kinds are considered? It is a rare thing for a man to fail at raising White Pekin ducks. When handled properly these birds will weigh five to six pounds at 10 weeks, and the price has been uniformly good for several years. In certain sections many folks have been raised to affluence at this business. Have any of your readers, raising both White Leghorns and White Pekin ducks in a commercial way, ever made a comparison of the profits from each? A. C.

New York.

R. N.-Y.—We welcome such comparative figures.

Can Hens Control Laying?

I read with much interest Mr. Cosgrove's remarks on page 1337 regarding the control by the hen of egg production. This may be an exceptional case, but I know of a hen being found dead, and on opening, a large cluster of eggs was found all ready with yolk and albumen but no shell. Each egg as it left the cluster and entered the oviduct simply joined onto the first original egg, and so on until filled with eggs. This must have caused pain or at least irritation, and if the hen has the power of stopping production, why did she allow this to happen as I have illustrated? I do not know of anything that has interested me more than Mr. Cosgrove's remarks, and I wish you would publish any criticisms of his statements. The question is, what surroundings does a hen need for constant egg production?

New York. F. A.

The above is a very interesting case. I never heard of one like it. At first thought it would seem to militate against the theory that a hen can stop or control egg production. Perhaps it is not the will or caprice of the hen that stops egg production, but the nervous shock which she sustains when moved to a new location, or when frightened. I had a hen that on being killed and opened, was found to have her abdomen filled with the cooked yolks of eggs The mass was as large as the doubled up fist of a large man. But it will be noticed that in neither of these cases was there any sudden shock to the nerves; the hens remained in their accustomed surroundings, with their usual food, etc., and there was nothing to stop the usual processes of nature. In the case I mentioned above the heat of the body had actually cooked the yolks, so that it was one solid mass. The cause was undoubtedly a ruptured oviduct; allowing the yolk to fall into the abdominal cavity. The white or albumen of the eggs was not visible at all; whether the yolk was dropped through before it reached the place where the white surrounds it, or whether the more liquid white was absorbed into the system, I don't pretend to say. I wish someone would explain why part of the hens at the contest stop laying after the first few days, and others in the same surroundings continue right on. There is a good deal yet to be learned in the poultry business. GEO. A. COSGROVE.

Cotton-Seed Meal for Hens.

Cotton-seed meal seems to be a cheap source of protein. For chickens would it be a good supplement for corn grain ration and dry mash bran and shorts, and in what proportion? C. W. M.

Cotton-seed meal has not found favor as a food for poultry, and has, in fact, been considered absolutely dangerous by good authorities. The Mississippi Agricultural Station has recently issued a bulletin, however, describing a series of experiments in which cotton-seed meal was made to replace meat scraps as a source of protein, and with apparently good results. Their work has not been conclusive but they state that it has tended to show that "As far as can be determined, the general condition of cotton-seed meal-fed fowls seems just as good as that of those fed upon beef scraps." They feed as large a proportion as 22 pounds in 98 of dry mash constantly before the fowls. While their feeding experiments seem to indicate that cotton-seed meal is of value as a poultry food, they do not unreservedly command it, but say that much longer tests are needed to ascertain its cumulative effects.

"WHY is it," queried the fair widow, "that they always say a man 'pines' for a woman?" "I suppose," growled the fussy bachelor, "it's because the pine is about the softest wood there is."—Pathfinder.

ACME
Pulverizing Harrow Clod-Crusher and Leveler
"ACME"
Eases a Big Part of Field Work
The ACME Pulverizing Harrow puts your soil in condition to conserve and make available for plant growth all the soil moisture.
The sharp sloping knives cut under to the plowed depth—thoroughly work the entire bed—crush the lumps and leave a fine surface mulch—embed in fine pulverized soil manure and refuse plowed under without tearing it out.
This makes better yields. The plant roots find nourishment easier because of a compacted seed bed. The ACME is the *only* implement you need after your plow to get a perfect seed bed It is light in draft and low priced—ask your John Deere dealer about it.

BUFFALO MARKETS.

The general conditions in Boston market during the Christmas holiday trade were brisk, with the supply just about right to supply the demand in nearly all cases. The trade in trees and greens was lively and large, as general decoration was more in evidence than usual this year. Trees were perhaps not as large as in years past, yet the price of 15 to 25 cents as a general rule was in favor of a larger than usual sale. Fruit in most cases sold unusually well, as no over supply of any kind was in the market, and good stuff brought good prices. Good apples sold well; best Baldwin $5.50 per barrel, with not quite as good going at $3.50 to $5; King and Spy $5 and $6; Greenings $3.50 to $5; common box stock $1 to $2. Western box fruit $2 to $3 for Jonathan, Grimes Golden, Beauty, Winsap, etc., with Winter Banana $4. Cranberries $7 to $9 per barrel, and $2.50 to $3 per box. Bananas $2 to $3.25 for good yellows with small bunches of seconds at $1 to $1.25 each; reds $3.50 to $4.50 for best, with small bunches $1.50 to $2. California melons $4.50 per crate; California lemons $5 per box, others around $4. California oranges $2.50 to $3.50 per box; Florida $3.50 to $4.50 for best, others $2.25 to $3.25 with a good demand at these prices. Grapefruit $2.50 to $4 per box. Pineapples $3 to $5 per crate. Florida strawberries 75 cents per box; native Beurre pears, box $4.

Tomatoes were a little short of the demand, being close picked to fill the demand as far as possible with native stock which went at 40 cents per pound, Floridas $5 and $6 per six basket carrier. Native celery very short, and as demand was imperative brought $2.50 to $3.50 per dozen bunches for Boston market and Pascal, while California white stock sold at $1.50 for best. Cucumbers were up in price from last quotation, bringing $12 per box of 100 for best; other grades $5 to $11. Lettuce is always in demand at this season and at present prices of 75 cents per box of 18 heads is a good crop to grow for profit. Cabbage is not a Christmas dish, and while it has brought $2.50 and better per barrel a short time since is now going at about $1.75. Cauliflower $2.25 to $3 per crate for California and Belgian stock. Onions in good demand at $2 to $2.25 per bag for native; Spanish $3 per crate. A short crop of squash keeps prices up. Hubbard $60 to $70 per ton, while Marrow and Turbans went at $2.50 and better per barrel. Rutabaga turnips short at $1.75 per bag, with egg and purple-top going at 60 to 70 cents per box. Good beets $1.25 per box; carrots 75; parsnips $1; Southern spinach brought $1.50 per barrel. Southern kale brought $1.25. Potatoes while not plentiful were enough in evidence to supply demand at reasonable prices going at $1.35 to $1.50 per bag of two bushels. Good sweets cheap for this season at $1.75 per barrel and 85 to $1 per basket.

The chicken and turkey market is much more in favor of the common buyer than at Thanksgiving time. Good turkeys were in good supply at from 20 to 25 cents per pound wholesale and 22 to 30 cents retail; these birds were much better in condition and looks than the Thanksgiving birds. Good Western geese were offered at 16 to 18 wholesale. Best native roasting chickens were offered at 22 and 24; good 18 to 20; common chickens and fowl 14 to 20; broiler chickens and fowl at 28; Western 24. The above prices are for dressed stock.

Dressed beef, best, 12 and 13; good 11 and 12; best veal 15; good, 12 and 14; common 10 to 12. Best fancy lamb 14; good 10 and 12. Best dressed hogs 10½. Live hogs at Brighton 8 to 8½. Live beef $7.50 to $8.50 for best, good grades at $6; common $4.25 to $5.50; poor $3.25 to $4.25 per hundred. Live veals 7 to 10 cents according to size and quality.

The horse market is slow at present, second hand find hard sale and must be kept a few months to realize value on same. A few first-class heavy horses go at $325 to $450 when a sale is made; lighter stock for common average business $200 to $300 each. Fancy milch cows bring $125 and hard to find. One sale is reported at Brighton of a fancy purebred Jersey at $300. Common milch cows go at round $60 each. A. E. P.

BOSTON MARKETS.

The Buffalo produce market turns on the increasing plentifulness of certain Southern fruits and the low price of potatoes, at a time of the year when almost everything ought to be going up. Potatoes have gone down quite lately, till farmers are beginning to hold them back for better prices. Sweet potatoes, which have been about as low as white ones, are now a little higher and dealers report that their next purchases will be still higher. The consumer pays 40 cents a peck for sweets and from 80 cents to $1 per bushel for whites.

The supply of apples is increasing, a good many varieties now selling by name, both home-grown and western. The price is 10 to 15 a small measure of not over 10 apples, some fancy western retailing as high as two for five cents. A fine sample of Wealthy is offered as eastern grown. It is claimed that this variety will color up about as well here as it will anywhere. Fancy red and green apples retail at $5 a barrel and nothing is quoted at less than $3. The effort is made to handle the home-grown sorts after the fashion of western and the Snow varieties are among those that come close to the mark. The offerings are quite liberal. An effort is made to sell windfalls in quantity, but they are not making a good appearance, being quite dirty and dull appearing. The high price has kept them above canning factory and evaporator prices.

The warm weather is still telling against poultry, so that dealers are not handling it in any quantity. The quotation is 25 cents a pound for dressed turkey, but the finest turkey can be bought at retail for that. Dressed fowl is five to eight cents less than turkey. Live fowls are less plenty, as the egg-laying season returns. The Buffalo Housewives' League has shown its enterprise by selling, a few days before Christmas 3,000 dozen eggs at 33 cents a dozen. They had been in storage a short time, but at this time of the year were practically the same as newly laid. It is expected that the league will repeat the experiment in some way before long. To make the best showing these eggs should have been offered on the first of December, for the regular quotations of fancy eggs is not now above 39 cents. Prices are still declining.

The mild season has told against the shipment of vegetables. Celery arrives fairly burned up and what is saved of it sells at 10 cents for small bunches. Brussels sprouts have had a fine Fall to mature and are coming in much improved condition, but retail at 20 cents a quart, which is too much, with beets, carrots, parsnip and vegetable oyster retailing at five to eight cents a bunch or small measure. Lettuce, too, is fine, heads as big as a small cabbage retailing at 10 cents. Radishes are also plenty and low, two bunches for five cents. Watercress has ventured out again, retailing at two small bunches for five cents. Cranberries are in three grades, retailing at 5, 10 and 15 cents a quart. J. W. C.

LIVE STOCK AND DAIRY PRICES.

Buffalo had a plentiful supply of milk last Summer. The farmer's price was advanced from 14 to 16 cents per gallon, which did away with the shortage of other years. The high retail prices have also taught the consumer to economize in the use of milk, so a milk famine is out of question. The general retail price is eight cents per quart. G. E. S.
Clarence, N. Y.

Milch cows from $60 to $80. Veal calves 12 cents on foot; hogs 11 cents dressed. Beef dressed by the side 13 to 15. Chicken young and old 18 and 20; eggs 40. Cabbage $1.50 to $2 per barrel. Celery 50 cents dozen, seven and eight cents a stalk. Potatoes 90. Hay from $8 to $14, for clean Timothy straw $8 to $9. Apples 90 to $1.25 per bushel. Peaches were from 50 cents to $1.50 per basket, one-half bushel. Strawberries $3.25 to $4 per 32-quart crate.
Coopersburg, Pa. A. W. B.

The prices we get are as follows: Hay baled $15.50 wholesale; straw $9; beef 9 to 10 cents a pound; hogs 11 to 12; butter, retail to consumer, 40; eggs, strictly fresh, retail, 50; potatoes, retail, from $3.50 to $5 a barrel. These prices are what we get here in Bradford township and possibly may be a little high for people living in smaller towns, farther back. M. I.
Custer City, Pa.

Good young horses, $100 to $200; old plugs, $5 up; beef, nine cents; veal, 14; mutton, nine cents; lambs, dressed, 15; pork, 12½ to 13; at the car; veal calves, nine cents; lambs, 7½. October and November price for milk, $1.95 per cwt.; butter, 35 up; eggs, strictly fresh, 48; fowls, live, 16; dressed, 18. Apples are very scarce, $1 to $1.50 per bushel; potatoes, 90 to $1; rutabagas, 60 to 75; carrots, 75; parsnips, $1 to $1.25; onions were $1.25; are now $1.50 per bushel; cabbage, five to eight cents. Hay at auction, $10.50 to $15 in mow; just ordinary scrub cows, $20 to $50; grade Holsteins, $75 to $100. A. C. G.

There is just enough snow here to whiten the ground a little. The roads are frozen, but not very rough. Considerable plowing was done this Fall. Farmers are now busy getting up their Winter's wood supply, although this is a light task compared with 25 years ago. Now there are two or three gasoline sawing rigs in most of the neighborhoods through the country, and when a farmer gets up a large pile of wood he hires a sawing rig and the wood is cut up in a hurry. Considerable baled hay has been shipped this Fall from here, and still there are a few lots of hay for sale yet. Cows remain high. There was an auction a week ago, near here; the stock was registered grade Jerseys, and sold from $39 to $110 each. Butter 30; eggs 30; chickens, live, 12; dressed hogs 10. P. S. S.
Chautauqua Co., N. Y.

THE trial of a notorious old moonshiner was over and he had been found guilty. The judge lectured him severely on his long criminal record, and then sentenced him to thirty-six years' imprisonment, saying that the court had no feeling of anger toward him, but only of pity. The prisoner listened stolidly and said as he left the courtroom: "Well, I suah am glad he wasn't mad at me."—Credit Lost.

Five-Hundred-Year-Old Pastures

Yield Rich and Abundant Crops of Clover when Fertilized with

Genuine Thomas Phosphate Powder

(Basic Slag Meal)

Key-Tree Brand

FAILING PASTURES are fast becoming a serious problem.

For years animals that have fed upon these pastures have carried away plant food from the land; Nitrogen in the forms of milk, flesh and wool; Phosphoric Acid in enormous quantities in the bones. Cattle bones, as a matter of fact, are fifty per cent bone phosphate of lime. Consequently, old pastures are found to be especially deficient in phosphoric acid, and of a generally infertile character.

The use of nitrogenous fertilizers is rarely profitable upon pasture lands, but by the application of GENUINE THOMAS PHOSPHATE POWDER, Key-Tree Brand, (which furnishes Phosphoric Acid, Lime, Magnesia and Iron,) the character of the herbage may be completely changed.

In place of the tough wild grasses, sorrel and weeds, there comes in a rich growth of clovers and highly palatable grasses, which transform the barren fields into luxurious feeding grounds.

After trials of various fertilizers on pastures for fourteen years, Professor William Somerville says: "Basic Slag applied as a single dressing at the rate of half a ton per acre has generally proved a most effective agent in improving the feeding value of pasture and its benefits are not nearly exhausted at the end of nine years."

Clovers will take their nitrogen from the air; but clovers must have Phosphoric Acid and Lime in abundance. ***Genuine Thomas Phosphate Powder, Key-Tree Brand,*** furnishes 17 to 19 per cent Phosphoric Acid and 35 to 50 per cent of Lime.

More cattle on our pastures will help to solve the problem of the high cost of living.

The whole story is told in our new booklet, "FIVE-HUNDRED-YEAR-OLD PASTURES." Is it not worth your while to study this carefully with a view to reducing your grain bills from one-third to one-half? A copy is yours for the asking.

The Coe-Mortimer Company

51 CHAMBERS STREET, NEW YORK CITY

Where Men of Ambition Prosper

NOWHERE is ambition rewarded more generously than in the Southeast. Small capital and energy will accomplish wonderful results for you in this favored land.

Dairying, trucking, fruit growing, poultry raising and general farming are making Southern farmers independent.

Land from $15 an Acre Up

Plenty of rain and ample sunshine every month, irrigation unnecessary. Growing season from 7 to 9 months duration. Two and three crops raised annually. Local markets plentiful and profitable. Early vegetables and fruit bring high prices in Northern cities.

Modern schools and highways, good churches, rural telephones, healthful climate and delightful summers and winters make the South the most desirable location in America for Homeseekers.

Learn How to Make Money

Send for the "Southern Field" magazine, booklets and farm lists which give the whole facts.

Mobile & Ohio R.R. Southern Ry. Ga. So. & Fla. Ry.

1913 RECORD *Magnificent Crops in all Western Canada*

All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

PUBLISHER'S DESK

An interesting case of alleged fraud was recently tried out in the New York City courts. John Forsythe ran a high-class men's furnishing store. His prices were high, but men paid the price, always feeling that they got superior value. Recently the firm failed, and the trade name and stock were sold to Lieberman Brothers, a firm also engaged in men's furnishings. Nat Presberg bought a shirt from the latter firm with the Forsythe label, and believing it to be a Forsythe $5 shirt. He paid $1.89 for it, the representations being that he was getting a bargain. Later he discovered that the Forsythe label was sewed on over another label and that he had actually bought a Manhattan shirt that sold usually for $1 at retail. Mr. Presberg brought an action against Lieberman Brothers. The defendants proved that it had been the custom of the Forsythe firm to purchase shirts from other manufacturers and have the Forsythe label sewed on over the label of the manufacturer. It was not proved definitely that the Manhattan shirts had gone through the Forsythe store, but neither was it shown that Lieberman had bought them direct from the manufacturer. The argument of the defense was that Lieberman had bought the goods and the right to use the Forsythe label, and that they were justified in selling the goods just as they came into Lieberman's possession just as Forsythe would have done. The case was dismissed on this showing. Yet Presberg paid nearly double the value of the shirt, and how many men previously paid Forsythe $5 each for similar shirts is merely a matter of conjecture. I cite this case to confirm what I have often said, namely, that city people are really more gullible than countrymen. In their egotism and pride and vanity they swallow doses that the countryman would scent miles away. When it comes to cupidity the honors seem about even. When a man or a woman becomes mesmerized with the prospect of quick riches, he or she, whether in city or country, falls for the allurement.

HELP WANTED

In locating a man representing himself to be S. M. Wilson, of 2014 Detroit Street, Cleveland, Ohio, a dealer in forest shade trees, for whom a warrant has been issued.

DESCRIPTION.

Said party is about five feet and 10 inches in height, age about 45 years, weight about 150 pounds, dark hair, slightly gray, mustache, three gold teeth, has black spot in one eye, probably caused by injury, wore dark gray suit, black overcoat, patent leather shoes, gold-rimmed spectacles. Party seemed to be well educated, and of good personal appearance.

This party buys forest shade trees of farmers, sells and transplants same for residents of towns, and after collecting for them, departs without paying for board, teaming, trees or labor.

Anyone locating this party is asked to cause his arrest and notify J. D. Yocom, Mayor, Oberlin, Ohio.

We gladly publish the above at the request of Mayor Yocom and congratulate Oberlin in having an executive officer who interests himself in the protection of the people of his city. We hope some of our people may be able to locate S. M. Wilson, and report direct to the mayor.

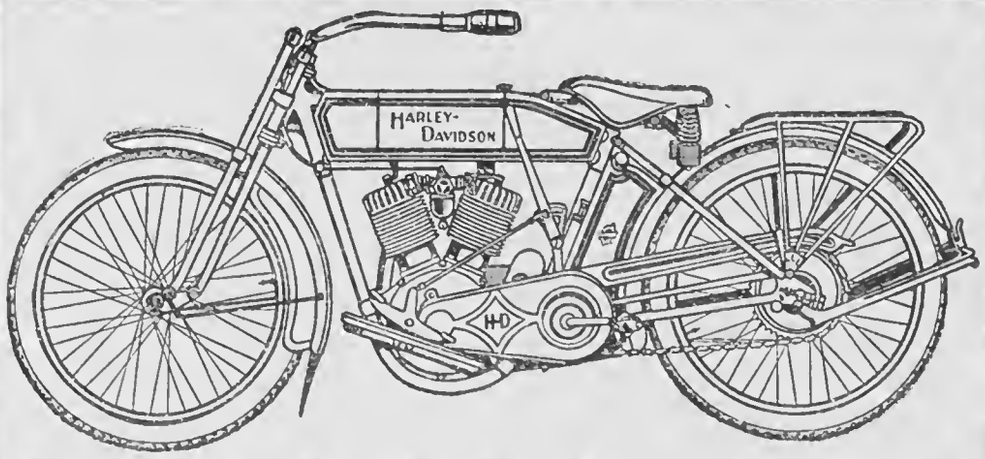
I read in the latest and enlarged R. N.-Y. that you ought to have 200,000 subscribers to support properly the increased size and expense of the paper. That may be true, but there is a better reason why you ought to have 200,000, and more; and that is, that no one who lives in the country, farmer or otherwise, can get along as well without THE R. N.-Y. as he can with its help. As to the required increase in revenue, there is another way to secure that. We all know that the public has been educated to expect to get their periodicals at less than manufacturing cost—and I am afraid a good many of them are dear even at that figure. But in the case of THE R. N.-Y. the contrast between the value and the price of the paper is too violent. For a weekly which is the efficient guide and business helper of every subscriber from January to December, which at a large money sacrifice winnows the advertising offered it till everything which might cause disappointment or loss to its readers has been blown away, which is the subscriber's indefatigable defender and champion in seeking either the passage or the repeal of legislation, which warns of business pitfalls and then stands ready to help out of the pit the unwary who despite its warnings has fallen therein, which is at once news-gatherer, instructor, adviser, problem-solver and collection agent—for such a service the price of one dollar a year is simply a joke. Make it $2 which would be say 10% of its average cash value to the subscriber, and thereby get the money needed to put back into increased service. Any present subscriber who would cease taking THE R. N.-Y. because it cost nearly four cents a week would be no serious loss to you or to your advertisers. I should be glad to get my next bill for renewal at the $2 rate. CHARLES T. ROOT.

New York.

We must be allowed the indulgence of a little pride in the receipt of the above letter. Aside from his farm interests Mr. Root is an experienced publisher of some of the most successful trade publications in this country. His judgment as to what a trade publication should be may be accepted as authoritative. Some may think him a bit too enthusiastic in his estimate of THE R. N.-Y., but those who know him and his papers will not question his sincerity or his competent judgment. Mr. Root's experience makes his suggestion valuable. The same suggestion has come to us before many times, often from farmers themselves. It has always been considered, and as often rejected. As a purely business proposition there is little doubt but that we could increase the subscription price to $2 a year, and develop the paper as a money-making basis faster than at the present price. But old fogy as a notion may seem, though a certain ratio of income to outgo must be maintained, our ambition is not to make the most money; but to render the greatest service to those farmers who most need such help as a farm paper can give them. We have some pride in the prosperous class of farmers in THE R. N.-Y. family. We aim to be of service to them. A large portion of them would not know the difference whether they pay $1 or $2 for the paper. But there are on the other hand many farmers to whom the extra dollar would mean a sacrifice in something else. It is true, as Mr. Root points out, that the extra revenue from those who could afford it, could be used to reach out for new subscribers of the more prosperous class, and that those lost would not be felt; but our life on the farm was among this needful class, and we would not like to feel that we had abandoned them or deliberately neglected an opportunity to serve them. There is one other consideration that impels us to stick to the $1 price. The circulation of the paper has been built up largely by its subscribers themselves from a small beginning to an edition this week of one hundred and sixty-odd thousand copies. Business men, professional men and bankers solicit subscriptions to THE R. N.-Y., and send in the full dollar. To quote one instance, one of the wealthiest and most successful business men in the State of Maine has been forwarding subscriptions from his neighbors, customers and friends for years. Every time we are confronted with a lawsuit he and others like him come forward with promises to help. These men do not do this to help us make money. They do it in recognition of the service we are able to do the individual farmer in things in which he is not situated so that he can protect himself. That sentiment is of course an asset. It is not our purpose to use it for individual gain. We are but the trustees of it, and it is our ambition to use it for the benefit of the family on the farm who most need help.

Robert B. Kellogg, head of the Kellogg Music Company, of No. 1,431 Broadway, was sentenced yesterday by Judge Grubb, in the United States District Court, to thirteen months in the federal penitentiary at Atlanta, Ga. Kellogg was convicted on a charge of having used the mails to defraud ambitious poets. He advertised that he would write music to song poems and market the output for a fee of $21. It was charged that he accepted the fee, but did not put the songs on the market. During the trial Kellogg admitted that the business netted him at least $800 a month, and also that he had never paid dividends to the writers of songs, except in one instance, when an author received 36 cents.—Daily Paper.

It is time something was done to stop the petty robbery of these fake music publishers. They have been at the game for a lifetime; and this seems to be the first conviction. THE R. N.-Y. refused their advertising and showed up the scheme more than 20 years ago, when the advertising was being accepted and published by papers of every class. We are certainly making some progress. J. J. D.



Startling, Exclusive Improvements Mark the 1914 Harley-Davidson

Step Starter Starts Machine With Rider in the Saddle and Both Wheels on the Ground

In case the rider accidentally stalls the motor in crowded traffic or on a steep hill it is no longer necessary to dismount, perhaps in the mud and find a level place to set the machine upon the stand in order to start the motor. Instead a downward push on either pedal—the step-starter does its work, and the motor begins again to throb.

Selective Type of Two-Speed

The Harley-Davidson two-speed gear (another patented feature) is located inside the rear hub, thus avoiding dust, dirt or damage. Its speeds are selective and the rider can shift from low to high, or high to low, or to neutral, at any time, whether the machine is standing still or in motion.

Ful-Floteing Seat

For the third successive year the Ful-Floteing Seat is standard. This patented device floats the weight of the rider between two concealed springs, assimilating all jars and vibration due to rough roads.

Double Clutch Control

The patented Harley-Davidson clutch can now be operated either by a foot lever on the left foot board or by a hand lever. The foot lever does away with the necessity of taking either hand off the handle bars, a great convenience when riding through sand or mud.

Double Brake Control

The new Harley-Davidson Band Brake (patented) can be operated either by a foot lever or by back pedaling on either pedal.

Folding Foot Boards

All models are equipped with Folding Foot Boards in addition to the regular pedals.

We will gladly send you on request our complete 1914 catalog giving full details of these and forty other improvements

BUTTER.

New York, Jan. 2, 1914.

The closing week of the year is usually a quiet period in the wholesale butter trade. Many of the jobbing houses were busy taking account of stock, and the buying was against current consumptive needs, except in one or two instances where out-of-town buyers took on lines of 500 to 1,000 tubs. Possibly the quietness tended to check any further advance in the fresh table grades, and the business was mainly at 37 and 37½ cents for creamery that rightly belongs in the class of extras. The proportion of stock that would pass official inspection is still small, but the average quality of the fresh make is improving and if this continues there will be fewer seconds and more firsts available. Colder weather has prevailed throughout the country and farmers have housed and fed their cows more generally than heretofore. There is still a considerable accumulation of "held fresh" creamery and it has quite an unsatisfactory trade, with values irregular from 23½ cents for low grade seconds to 33 cents for pretty good firsts. Storage creamery is moving into consumptive channels quite freely and not over 110,000 packages are carried over into the new year. For all the goods that are made from farmers' butter—process, ladles and packing stock—outlets are narrow and there is the widest range of values that the trade here has known for many years. This is undoubtedly due to the fact that Siberian butter has been a considerable competitor since October 1. Several thousand casks of these goods were purchased in London, Copenhagen and Hamburg, most of which were made last Summer and stored in the freezers at those points. A little of this butter, particularly the freshest lots, sells up to 28 and 30 cents, but the larger part goes to bakers' trade at 23 and 25 cents. It is packed in white wood casks, weighing 110 to 130 pounds. Several thonsand 56-pound boxes of Argentine and New Zealand butter are now on the way here. The year's statistical figures, just compiled, are of much interest. Receipts of domestic butter aggregated 2,516,485 packages, of an average weight of about 58 pounds, an increase over the previous year of a little over 82,000 packages, which makes a new record for New York.

CHEESE.

New York appears to be handling a relatively smaller part of the country's production of cheese each year. The 1913 receipts were but 642,317 boxes against 713,034 boxes for 1912 and 806,359 boxes for 1911. The exports from this part during 1913 were equivalent to about 35,000 forty-pound boxes, against about 44,500 boxes during 1912 and about 183,250 boxes during 1911. The market on storage cheese at this writing looks more favorable to holders than for some time past. Present selling values—17 and 17¼ cents for best State flats—enable holders to sell most of the high-cost Fall purchases without loss.

EGGS.

The movement of fresh gathered eggs to distributing markets has fallen off somewhat. The practical exhaustion of storage reserve at the smaller interior centers and the comparatively low prices ruling for fresh at many primary points during mid-December led to an enlargement of interior consumption of fresh and with colder weather at many points the production has made little, if any, further expansion. Reserve stock in the larger cities has been reduced to unusually small amounts, and the relation of these to the recent rate of output has given the markets an undercurrent of great strength. New York will carry into January a total stock of only about 160,000 cases of which some 25,000 cases are in receivers' hands outside of cold storage, about 15,000 cases the latter amount being of fresh gathered and the balance refrigerators and foreign eggs. The statistics indicate that New York's output of eggs into consumption was close to 400,000 cases in December and as January receipts for five years past have averaged only about 185,000 cases there is seen to be a prospect of shortage though this may be obviated by importations, by a further curtailment of demand, or by a possible increase of fresh production. Fresh Western eggs advanced up to Monday of this week when firsts to extra firsts sold at a range of 36 to 38 cents, but at the close they have eased off to 35½ and 37 cents under a quieter trading incident to the close of the year. Storage eggs however are closing strong at 30 and 32 cents for good to finest qualities.

Importations of eggs since November 1 have been 12,328 cases at New York. These cases are approximately six feet long by two feet wide and about 10 inches deep with a double partition in the middle. They contain 120 dozen eggs each, packed in a coarse excelsior or straw. They have come chiefly from Hamburg with a few from Bremen and a few from London. The eggs originate in many European countries, chiefly in Austria, but with some from Russia, Bulgaria and Italy. Few of the lots shipped as fresh have been fine enough to compete with the better grades of domestic fresh gathered and many of them have been quite poor, showing considerable loss in spots and an undesirable flavor, probably due to damp packing. On the present market most sales of foreign fresh are in range of 28 and 32 cents, only a few exceptionally good lots going higher, and some inferior lots have sold lower. Good foreign refrigerator eggs have compared favorably with ordinary grades of domestic but their irregular condition has necessitated sales at easy prices, generally 24 and 26 cents, a few higher and a few lower. Foreign limed have been of useful quality and have sold very well for bakers' trade at 23½ and 24½ cents. There is prospect of further considerable importations.

LIVE POULTRY.

There has been a fairly active demand for live poultry the past week or 10 days, on the basis of 15 cents per pound for fowls, 14 cents for chickens, 11½ cents for old roosters, 22 cents for turkeys, 16 cents for ducks, 14 cents for geese, 65 cents per pair for guineas and 20 cents per pair for pigeons. Some shippers have not been satisfied with these prices, and considerable stock has accumulated on track under limits. At the close with so much stock held off the market and dealers in want of stock, a firmer feeling has developed on fowls and chickens with prices advanced one-half cent. Receipts have been heavy, footing up since Monday, Dec. 22nd—115 carloads. Turkeys closing quite firm and ducks in good demand and firm with fattened stock bringing a considerable premium. Receipts of live poultry for the year 1913 aggregated 5,819 carloads by freight and express, against 5,607 carloads in 1912. Estimating 18,000 pounds to the carload it foots up a weight of 98,923,000 pounds. A fair estimate of the value is 15½ cents per pound which totals an amount of $15,711,300.

DRESSED POULTRY.

The demand for dressed poultry during the holidays just passed was somewhat disappointing. The heavy losses sustained at the Thanksgiving holiday, owing to poultry arriving in bad condition, when many tons were condemned by the health authorities and destroyed, naturally caused dealers to operate cautiously. Supplies of fancy turkeys were not in any surplus, and while the trading was moderate the market gradually cleaned up before the close of the year at generally 22 and 23 cents for fancy western; 23 and 24 cents for finest New York State, Pennsylvania and Virginia, and 26 and 27 cents for fancy Maryland, Delaware and Jersey with feeling stronger at the close on western at 23 and 23½ cents. The larger proportion of the western receipts, however, for the holiday market were simply fair to good grades, including quite a number packed in ice from southerly sections which sold around 20 and 21 cents. Chickens and fowls were in liberal supply, general demand slow, and a large surplus had to go into refrigerators. Ducks and geese were in moderate supply for the Christmas holiday and brought extreme prices, but since that holiday demand has been slow, stock accumulating and prices have declined from 2 to 4 cents per pound. Squabs in fair demand. Spring guineas generally slow sale. Receipts of dressed poultry for the year 1913 were 1,082,273 packages, against 1,054,121 packages in 1912. Taking the different styles of packages from small boxes, 12 birds to the box, to large barrels, a fair estimate in weight would be 160 pounds to the package, which makes a total weight of 173,163,680 pounds. Estimating the value at 18 cents per pound totals an amount of $32,035,280.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages.

WOULD like work on a farm. J. L. LOYD DAVIS, Box No. 62, Boston, N. Y.

POSITION as private secretary. Familiar with farm operations. Small salary for short hours. EXPERIENCE, care R. N.-Y.

SINGLE man 33, with 3 years experience, wishes work on poultry farm. J. K. G., care Rural New-Yorker, 333 W. 30th St.

POULTRYMAN wants position on poultry farm, thoroughly experienced in all lines. GEO. PARISH, 320 W. 25th St., New York, N. Y.

SITUATION WANTED—Fruit grower of long experience will contract to trim old or young orchards in scientific manner at reasonable prices. Orchards planned and planted. H. W. COBB, Ridgewood, N. J.

PRACTICAL POULTRYMAN with farm office experience, including shorthand and typewriting, seeks similar position or would invest, with services in well conducted utility plant. K. J. D., care D. N.-Y.

WANTED—Intelligent man wants position on fowl farm with orchard preferable. Some knowledge of poultry but not thoroughly experienced. Had course in fruit growing at Cornell. S. MILLER, 306 E. 165th St., Broux, N. Y.

WANTED—A chance to build up and systematize that new farm, or put life into the old one. Middle-aged, married man; small family; agricultural college training; life experience in farm problems; scientific feeding and breeding of dairy stock; rotation; accounts; handling men, soil, and stock for highest returns. No booze or tobacco. F. M. V., care R. N.-Y.

OUR GRADUATES will be ready to accept positions as dairymen, poultrymen, horticulturists and general farm help on March 1st, 1914. Applications will be considered in the order received. Address BARON DE HIRSCH AGRICULTURAL SCHOOL, Woodbine, N. J., Dept. B.

WANTED—Married man on truck and fruit farm, experienced, sober. Address D. A. COLEMAN, Watervliet, N. Y.

WANTED—Single, young man, some experience, to work on farm, must be good milker, good wages. CHARLES BLOSS, Blossvale, N. Y.

WANTED—A single German man 35 to 45 years of age, all round farmer, who can handle a team and is not afraid of hard work. For full particulars write H. A. BENNETT, Ridgewood, N. J., R. F. D. 1.

WANTED—Man and wife as second farm hand. Cottage, heat, light, milk, and such vegetables as grow on place furnished. Must be willing to board man for which cash payment will be made. Give full particulars including wages, age, nationality and references. JOHN T. CADE, R. F. D. 1, Ridgewood, N. J.

$1300 BUYS fine 30-acre farm near Troy, sightly location. DEAN SEVENTH, Troy, N. Y.

WILL EXCHANGE lots value $10,000 on R. R., near Westbury, L. I., for a large farm, free and clear. W. B. WELLING, 2 Wall St., N. Y.

FOR SALE—Best ninety-acre river farm, Delaware Co. Write S. A. FISHER, Unadilla, N. Y.

FOR SALE—25-acre farm, good buildings, fertile Alfalfa soil, young fruit trees. Near railway town. JULIUS MILLS, Fillmore, N. Y.

250-ACRE FARM, $50 per acre, just off State road to Buffalo. ALBERT D. JAMIESON, owner, 606 White Bldg., Buffalo, N. Y.

VIRGINIA FARM of 110 acres, 40 cleared, balance well timbered. 2½ miles to depot. Apply for fuller particulars to, OWNER, Lock Box 249, Louisa, Va.

FOR SALE—68-Acre fruit farm. 3,000 pear trees of many varieties, from 2 to 10 years old. Yielded the last year over 2,400 baskets. Good farm home and out-buildings. Call on or address REV. B. F. REAVE, East Quogue P. O., Suffolk Co., N. Y.

FOR SALE—Finest twenty-five acre tract on south shore Oneida lake, best of soil, forty apple trees, ideal for fruit and poultry, or country home. No buildings, near church and school. State road. Address BOX 165, Cazenovia, N. Y.

FOR SALE—Central Jersey farm and peach orchard. 185 acres, 13 room house, steam heat, bath room, best plumbing, 6 room cottage and 16 other buildings, silo, etc. Water system. Equipment for 1,200 chickens. 5,000 young peach trees, one-half bearing. Power spraying outfit, complete farm equipment. Price R. E. $18,000. Stock and personal property $7,000. Very favorable terms. Address BOX M. C., care Rural New-Yorker.

WANTED—A tract of wild land with or without buildings, in Northern New Jersey, will give in exchange two stores, mortgage $1,500 in a suburban town. BOX 11, Hillsdale, N. J.

WANTED—Small farm, adapted to fruit and poultry near good markets; state full particulars with lowest price. J. H. G., care R. N.-Y., 333 West 30th St., New York.

WANTED—Portable rip saw. S. E. TERRY, Holtsville, N. Y.

WANTED—Good Jersey red boar, ready for service. H. W. COBB, Ridgewood, N. J.

HIGHEST MARKET PRICE PAID for Low's Champion Bush Bean Seed by F. H. HAYES, Dexter, Me.

WANTED—Ham, bacon, eggs, potatoes, butter, and apples direct from farmer. Address ALBERT D. JAMIESON, 606 White Bldg., Buffalo.

WANTED—A few boxes selected Jersey sweet apples or other good sweet table apples. BOX 412, Williamsport, Pa.

MAPLE COVE FARM—Products to Consumers. 5 lbs. butter, 6 lbs. chickens, 1 lb. honey, 2 lbs. carrots, 15 lbs. potatoes, 2 dozen eggs. Box $6. Shipped Thursdays, postpaid covering third zone. ROUTE 24, Athens, Pa.

Jacobson Gasoline-Kerosene Engines

Send for Free Booklet

One of our types of engines is bound to be just what *you* need, Mr. Farmer. One of our newest operates on either gasoline *or* kerosene. You realize what an advantage that is, for kerosene's most always on hand. No matter what job you want to do, the Jacobson engine simply walks away with the work. Jacobson Portable Gasoline Engines are approved and labeled by the Underwriters. Material and workmanship faultless.

AMERICAN INGOT IRON ARMCO 99.84% PURE

GUARANTEED FOR 30 YEARS
INGOT IRON ROOFING

A new roof free if it rusts out. No painting or repairs required. Our Bond protects you. Fire-proof, lightning-proof. Costs no more than ordinary roofing. Write for big illustrated book FREE.

The American Iron Roofing Co.
ELYRIA, O. Station 16 MIDDLETOWN, OHIO

SPRAYER for Gardens, Estates, Parks, etc.

20 gallon, one man outfit, mounted, 100 lbs. pressure. Brass pump, easily taken out of the barrel. No corrosion. Ball valves, wick packing, easily got at. One of 70

IRON AGE Bucket, Knapsack, Barrel, Power and Traction Sprayers.

Something suitable for each man—from poultry house and small garden, or a few home bushes, to the big orchard and field crops. Unit Sprayers that can be built up to your growing needs. Ask your dealer to show them and get our new "Spray" book, spray information and Iron Age Farm and Garden News.

Can be used as a bucket pump.

FULL COLONIES of Italian Bees for sale. CEDARHURST FARM, Pomona, N. Y.

COLT 50 light acetylene gas generator, good as new. Price $30. ALDENE M. E. CHURCH, W. McClatchey, chairman, Roselle Park, N. J.

FOR SALE—Sixteen tons Ohio Alfalfa first and second cutting. No weeds. ROBINSON BROS., Plain City, Ohio.

WANTED—Cornell colony house and heater, or heater only. G. CHAUNCEY PARSONS, Mountainville, N. Y.

FOR SALE—Several No. 2 and No. 3 Prairie State Incubators, in first-class condition, been used two seasons. Prices very reasonable if taken at once. Address WHITE HORSE FARMS, Paoli, Chester County, Pennsylvania.

Burpee's Seeds Grow

The Leading American Seed Catalog

Burpee's Annual for 1914

which is now being mailed at the rate of more than ten thousand copies every day, is a Bright New Book of 182 pages and is known as the "Silent Salesman" of the world's largest Mail-order Seed trade. It tells the plain truth about

Burpee-Quality Seeds that Grow

With hundreds of illustrations from photographs and carefully written descriptions of Vegetable and Flower Seeds, it is a *safe guide* to Success in the garden and should be consulted by every one who plants seeds, either for pleasure or profit. We are pleased to mail it free to every one who has a garden and asks for it. Shall we mail you a copy? If so kindly mention "The Rural New-Yorker" and write to-day.

The House of Burpee

has introduced more distinct New Varieties of Vegetables and Flowers that are now in general cultivation than have any three other American firms. Selected Stocks are produced upon our own seed farms in Pennsylvania, New Jersey, and California, while FORDHOOK FARMS are famous as the largest and most complete trial grounds in America. We travel more than thirty thousand miles each season to inspect growing crops, and yet never a single mile to solicit an order! We trust, however, that you will read our "*Silent Salesman.*"

A postal card will bring it. But please write TO-DAY,—"Lest You Forget."

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII., No. 4238. NEW YORK, JANUARY 17, 1914. WEEKLY $1.00 PER YEAR.

FITTING SOUTHERN SOIL FOR GRASS.

Thorough Tillage Needed.

On page 1293 of last year's volume we printed an article by Mr. Edwin Earle of Virginia on growing grass at the South. There have been so many questions for more detailed statements about preparing the land that Mr. Earle has answered them in the following.

Preliminary to putting a field in grass we invariably plow deeply during the Fall and Winter, whenever the surface will admit, regardless of moisture in the land, as the frost can be depended upon to put it in good condition for ordering in the Spring. One of the great advantages in a disk plow is the scraper, which keeps the disks clear, no matter what the consistency of the soil may be. In the Spring we drag the land and at this stage generally distribute our limestone and disk it into the soil; the final ordering we postpone until we are preparing to sow corn, save that in the event of very heavy rains we may break the crust with either disk or spring-tooth harrow. When corn has been planted and worked four or five times we usually broadcast peas and give the corn its last cultivation. The peas are disked into the land thoroughly as soon as the corn is in the shock and the field is then sown to either wheat or oats.

When the grain is off in the following Summer, we again break with the disk plow, getting every inch of depth possible and following with drag. As soon thereafter as is convenient we start a procession of disk harrow, roller and smoothing harrow until practically every lump has been worked out and the seed bed well compacted. We then leave the field for the weed and grass seeds to germinate by repeated cultivation after showers, and in the eradication of new growth the soil is kept well stirred. In the final ordering the various machines go back and forth until the soil is as fine as we can get it. We then broadcast our fertilizer with the lime distributor. This machine is 10 feet wide, and is followed by a seed broadcasting machine of the same width, sowing half of the seed, the remainder being sown later across the first sowing, and in this last sowing we usually mix about four pounds per acre of inoculated Alfalfa seed, our aim being to provide an Alfalfa inoculation in every field. The field is then rolled and we leave it.

This method has given us splendid results, the only variation is in the number of times we go over the field in our preparation. This depends so largely on the season and the character and condition of the soil, no set rule can be followed. I believe it is not possible to overdo tillage, and were it always practical I would never sow a grass seed until I had a perfect dust mulch. I also attach great importance to deep plowing for all crops, but before seeding to grasses, clovers or small grain, the seed bed should be thoroughly compacted.

Were it possible to command the weather, I would always sow my grasses soon after a shower, and provide a gentle rain to follow the planting. If, however, I can have the moisture but once, I prefer it immediately afrer the seeding. As a measure of

'CAN I GO WITH YOU, MY PRETTY MAID?" "NOBODY ASKED YOU, SIR," SHE SAID. FIG. 23.

insurance, when growth starts in the Spring, I top-dress with 100 to 200 pounds nitrate of soda, preferring nitrogen in this form, as it practically assures a good cutting of hay regardless of the season. I have described our practice in any land intended for grass; were I to pick my land, I would naturally select well-drained bottoms, with southern or eastern exposure, and seed nad fertilize heavily. I experimented on about two acres of such land a year ago, and took off about 3½ tons of baled hay in the first cutting, and now have a sod that looks good for four or five tons per acre when cut again. I went to extremes in this instance, sowing 120 pounds Timothy and nearly a bushel of Red-top; am not yet ready to confess that I sowed too heavily. I do not think I would care to sow grass on a heavy growth recently turned under; would rather lime it and sow small grains. I would, however, like to turn under a heavy crop (Crimson clover preferred) in May, and sow to grass or Alfalfa in late August, after the most perfect tillage during the intervening months. This would be ideal.

In broadcasting fertilizer, nitrate of soda, lime-stone, etc., my lime and fertilizer sower is invaluable. We can spread nitrate of soda satisfactorily down to as little as 50 pounds per acre. To illustrate its accuracy, I set aside 124 bags of basic slag for a field of 31 acres, and it worked out exactly. In broadcasting seed we either mix and sow with the fertilizer, or use a low-priced machine, which works accurately in the heavy sowing we make. We pay no attention to gauges, etc., bnt try out our machines on known acreage and ascertain just what it will sow of the various fertilizers, etc. As intimated in my former letter, my practical experience is limited to three seasons, and I am only just beginning to find out what can be accomplished. While I took a short cut to success by generous use of seed and fertilizer, I doubt if so much fertilizer, in one application, is necessary. Half the quantity might prodnce substantially the same results. I have felt, however, that I could better afford the more liberal application in view of the fact that basic slag is soluble in water and does not leach out of the soil, but remains until taken up as plant food. I use no caustic lime, nor acid fertilizer; it costs so much to put humus into the soil, I am not willing to lose any portion of it save in the development of plant life. In short, I am trying to increase production, and at the same time improve my land, and in this I am succeeding.

Albemarle Co., Va. EDWIN EARLE.

PRINCIPLES OF ICE-HOUSE BUILDING.

The details of construction of a building to store ice in are not agreed upon by all experts. The main principles involved, however, are few and may be briefly stated. The object of the whole structure is to keep the ice as long as possible with the least waste. This may be accomplished only if the ice is thoroughly insulated from the effect of the warm outside air, the heat of the sun and the radiation from the earth. The first two are almost always well provided for, but in most small icehouses the latter is not equally well taken care of. The first icehouses were merely pits dug into the earth in a sheltered spot, lined in some way, perhaps with stone or mortar, and covered over with a roof and a thick layer of leaves, grass or brush. This is still sometimes used where a small supply only is wanted. If ice is not obtainable, snow is thus kept for awhile. From this poor make-shift up to the best kind of a storage plant with solid stone foundations extending below the frost line and projecting a few feet above the ground, on top of which a double-walled building is built of matched boards, there are many grades of buildings. In every case double walls are essential, and for good insulation, the walls must be airtight. This may be accomplished by using matched boards, by covering with tar paper on the air-space side, by shingling, clapboarding or by caulking the cracks with any convenient substance. The purpose of these walls is to surround the building by a layer of dry, dead air, for such air is the best insulator there is. Sometimes the air space is filled with sawdust, excelsior, paper, wool, or some similar substance, in the belief that it is a good insulator. The only purpose served by such fillings is to keep the air dead, that is, keep it from circulating. These substances are all more or less conducting themselves, but they retain the air in their pores and in the spaces between the particles, and this air held stationary is the insulator. If the walls are really airtight, and there can be no circulation, there is no need whatever for the filling material and, in fact, it would be a decided detriment. If the walls are not perfectly airtight, the filling material—usually hay, straw, or sawdust, or dry moss—is very necessary. It is best, in all cases, to have horizontal partitions in the dead air space every four feet or so up, so as to cut off any circulation due to the hot air rising and the cold air dropping. Vertical partitions will be formed by the upright joists which support the walls. These partitions should be of as thin wood as can be handled, or may even be of tarred paper folded and tacked on each wall. The partitions at the joists may be made in the same way. Suppose an eight-inch air space is decided upon and you want to use 2x3 inch stock. There will be a two-inch space between the joists, if you put them side to side. While all this sounds like unnecessary trouble, and it seems like a long job, still after you get at it you will find it a simple matter, and far more satisfactory than any other way you could handle the work. Of course, the lower end and the upper end of the air space will be tightly closed with boarding. So much for the side walls.

The roof should be doubled and, in my opinion, the very best way to build it is as follows: Right on the four walls build a single thickness flat roof covered with tarred paper. Then over this build a hip roof and let it project over the side walls considerably on each side. I would shingle this. Some provision must be made to ventilate the space over the ice and beneath the flat roof. To do this, I would cut small doorways through the north and west sides up as near the roof as possible and near the northeast corner and the southwest corner of the icehouse, respectively. Perhaps these openings would be a foot and a half high and two feet wide for a small icehouse. The openings must be sided like a window so as not to disturb the air space, and the doors to close them may desirably be double walled. If desired, one of these openings may be made somewhat larger to be used as an entrance for inspection of the top dressing of the ice and the removal of snch ice as is needed.

The foundation of an icehouse should be of stone, brick or concrete, extending well down into the gronnd below the frost line. It is not generally built so. The common plan is to use the same sort of foundation as the rest of the farm buildings—a layer of stone on top of the ground. In this case there are a number of ways the floor can be fixed. First, a ditch should be dug in the floor six inches deep and with side branches covering the whole floor. The center ditch should, of course, be sloped to carry off the waste water. The whole floor, ditches and all, should then have a layer of broken stone placed on it a foot deep over which a layer of straw may be placed, followed by a thin layer of ashes in which are laid the snpporting beams for the board floor, if the house is large enough to require them. If not, the floor boards may be laid right on top of the ashes. In any case, the ashes should come up to the floor boards, and the latter should be laid with small cracks so that the waste water can go through. If a board floor is not desired, put a layer of sawdust on top of the ashes and pack the ice on that. It might also be desirable to have a tightly closing trap door in the roof of the house and a similar one, not directly beneath, in the flat roof. Then in case of bad steaming of the ice more decided ventilation may be obtained and, in case it is needed, the space between roofs may be utilized for storage of tools or sawdust.

The ice should be stored during freezing weather so that it will be dry when packed, and not freeze all together in the house. The packing requires great care and time. It is much better to pack as much as you need and have it keep well than to pack all you can get hold of and lose half of it from poor handling. I believe that all handling of the ice and inspection should be made from the top, and that no doors should be opened at the bottom of the walls. Then there will not be a constant circulation of warm air through the mass when the house is entered. If you use a lower door when packing, this door should afterwards be stopped up from the inside with sawdust. The cakes should be packed with broken joints, so as to prevent circulation of air in the house, and each cake should be an inch and a half from its neighbors on every side. No broken cakes nor small pieces of ice should be admitted to the house, and as little trimming should be done to the cakes as possible. Over the top of the ice should be a 12-inch layer of sawdust. Some icemen believe that if this layer is divided into two six-inch layers separated by a thick layer of paper, the wasting is less. Around the sides of the ice and within the walls it is quite common to pack sawdust, filling a space of from four to six inches. It is a question whether it is best to do that or to pack up close to the walls, leaving perhaps an inch and having every fourth tier of cakes touching the walls so as to retard circulation. A discussion of this by the readers would be helpful, no doubt, as would also be some experiences as to whether it is worth while to pack the first tier on edge in place of flat like the other tiers, the supposed advantage being that as the ice wastes edgewise, it wastes less weight during any fixed time. Personally, I have not found it so, for although each cake wastes less, there are more cakes on the lower layer when packed edgewise. R. P. C.

FARMING FOR FURS

During the past year we have received many questions like this from Sullivan Co., N. Y.:

I have a tract of land which seems suitable for fur farming. I thought of ditching around it and building below ground a strong wall of stone and concrete, with a tight wire fence above ground. Inside this enclosure I would like to breed minks or skunks. Is such an idea practicable?

We have known many skunk farms to start, run for a while and fail. The trouble usually comes through a disease which breaks out among the skunks. On reference to the Bureau of Biological Survey at Washington, we received the following:

"The growing scarcity of fur animals throughout the United States, and the consequent high prices, has led a great many persons to consider the feasibility of producing furs with animals in captivity. The subject is one of considerable importance, as the American people are facing a condition in which the supply of furs is entirely inadequate to the demands. The interest is widespread, and so far as fox farming is concerned, a considerable measure of success has been attained. In Prince Edward Island at the present time the capital invested in this industry is about ten million dollars, and the assessed valuation of foxes in captivity is but little less than this sum. The companies last year declared dividends of from 40 to 900 per cent. on their capital stock.

"The fur of the fox is much inferior in wearing quality to that of the mink and skunk, and if these two animals can be reared successfully at a profit, there is an opening for a very important industry. The Biological Survey, during the last few months, has had several hundred inquiries from people who are contemplating engaging in this business. We know of over a hundred who are making experiments with the skunk and probably half as many who are trying to raise minks. Several are also making experiments with muskrats. Some have been pretty successful, while others have failed. There are 13 licensed skunk farms in the State of New York and many others in the Middle West. Mr. E. T. Seton, the author and ntauralist, has raised about a hundred skunks at his place in Connecticut. He and a number of other breeders remove the scent sacs of the skunks when they are about a month old, and as a result the keeping of these animals is no more unpleasant than that of keeping cats or other domestic animals.

"Under these circumstances, the Biological Survey considers that it is wise to encourage the production of furs in this way and we have done all possible to help breeders with advice when they have applied to us. We have also undertaken experiments in raising minks on our own account. We have not been entirely sanguine as to the question of profits from fur farming within the United States, but the time is soon coming when the market value of furs will be much greater than at present, and should the ventures prove profitable, there is a good outlook for an industry of considerable economic importance." D. E. LANTZ.

WHAT KIND OF LIME?

Shall I purchase burned lime or raw ground rock? The best farmers in this vicinity hold opposite views on this question. Several farmers are paying from $4 to $4.20 per ton for raw ground limestone, when they could buy the burned lime analyzing 98 per cent. for $4.35 delivered at Milford. I can get the raw ground stone analyzing 52 per cent. oxide delivered at Milford for $3.70 per ton, car lots; burned analyzing 98 per cent. delivered for $4.35. M. H. F.

Milford, N. Y.

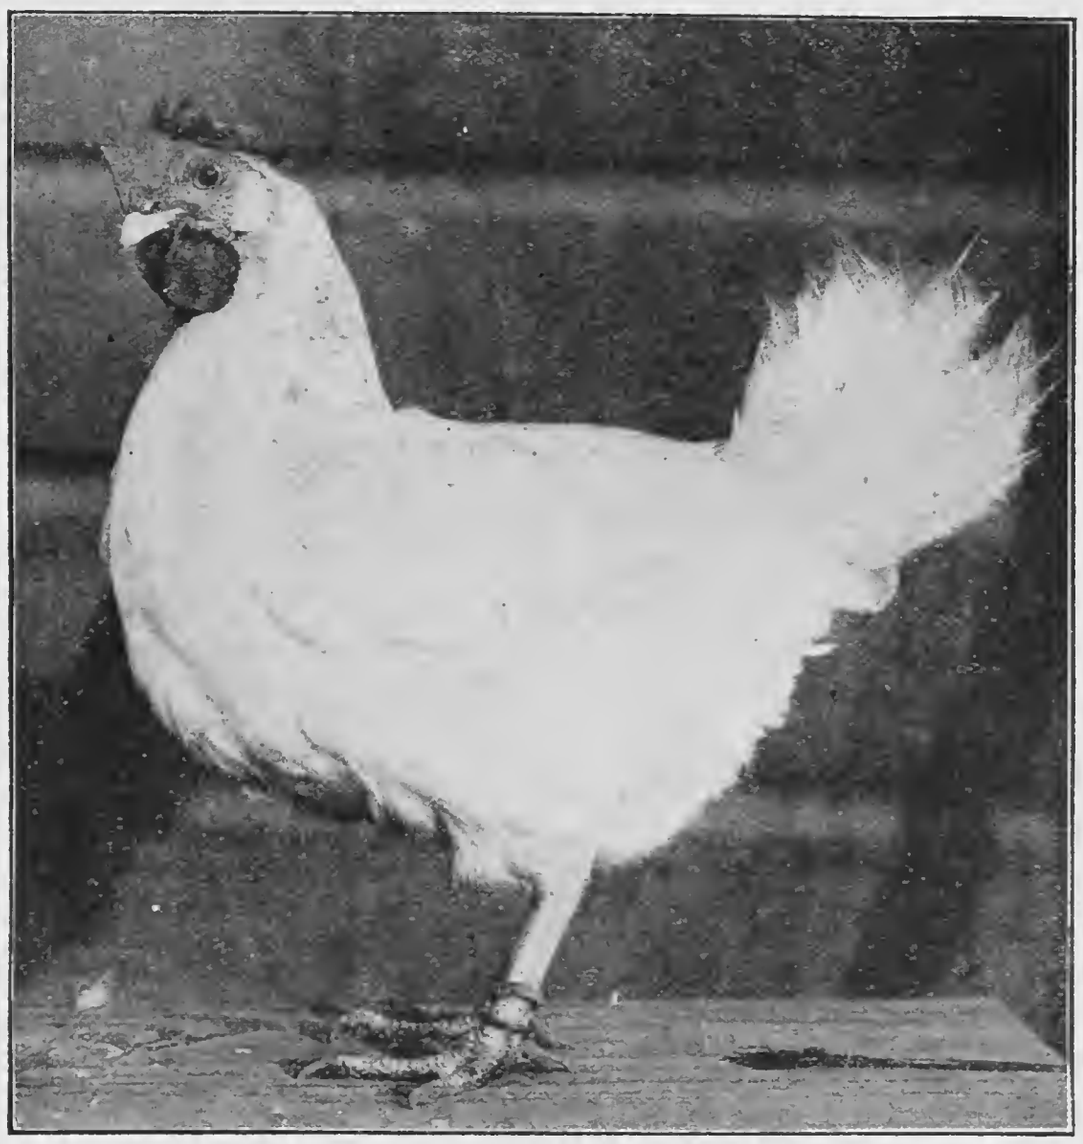
From our own experience we should consider the soil and the crop in deciding between raw limestone or slaked lime. On stiff clay inclined to bake hard in a drought we should use slaked lime and also on very sour soils not perfectly drained. The slaked lime is, we believe, usually better in such crops as clover, Alfalfa, Timothy, garden crops—all those which prefer an alkaline soil, or which respond to a quick chemical action. We prefer the ground limestone on soil well filled with humus, and not particularly acid, and on the lighter sandy soils. The ground limestone seems better adapted to corn, as that crop, like rye, is usually capable of giving a good yield on slightly acid soil. In cases where the slaked lime is preferred, the reason is that this form gives a quicker and more powerful chemical action in the soil.

THE WORLD'S CHAMPION HEN.

Poultry-work in Oregon.

[We have made several references to a hen at the Oregon Experiment Station with a record of 303 eggs in one year. Now we can show at Fig 24 a good picture of the hen, with comments by Prof. James Dryden. We understand that this hen is what you may call line-bred cross of White Leghorn and White P. Rock.]

We have a number of egg records, both individual records and yard averages, that are very encouraging. Hen C543 laid 291 eggs in 12 months of laying. Hen C521, Fig. 24, a flock mate, finished with a record of 303 eggs, both of them, I believe, being world records. There may be better hens, but there are no authentic records telling us what they are that I know of. These two high records show something of the great possibilities of the hen, but the most encouraging thing is that there are other records to back them up. These two hens were bred from 200-egg hens and their sires are from 200-egg hens, and that is the most noteworthy thing about their performance. In the contest at Storrs, Conn., out of some 500 hens selected by different breeders in different sections of the United States, Canada and England, one laid 282 eggs and it is interesting to learn that the record hens at Storrs, as well as at Missouri, were produced by one man in England, who has been trap-nesting his flock and selecting his breeding stock on the basis of his trap-nesting records. I am not informed that any other pens entered in those competitions were from trap-nested layers or had individual pedigrees showing high laying ancestry. Taken in connection with our Station records here, this is strong evidence of the utility of the trap-nest.

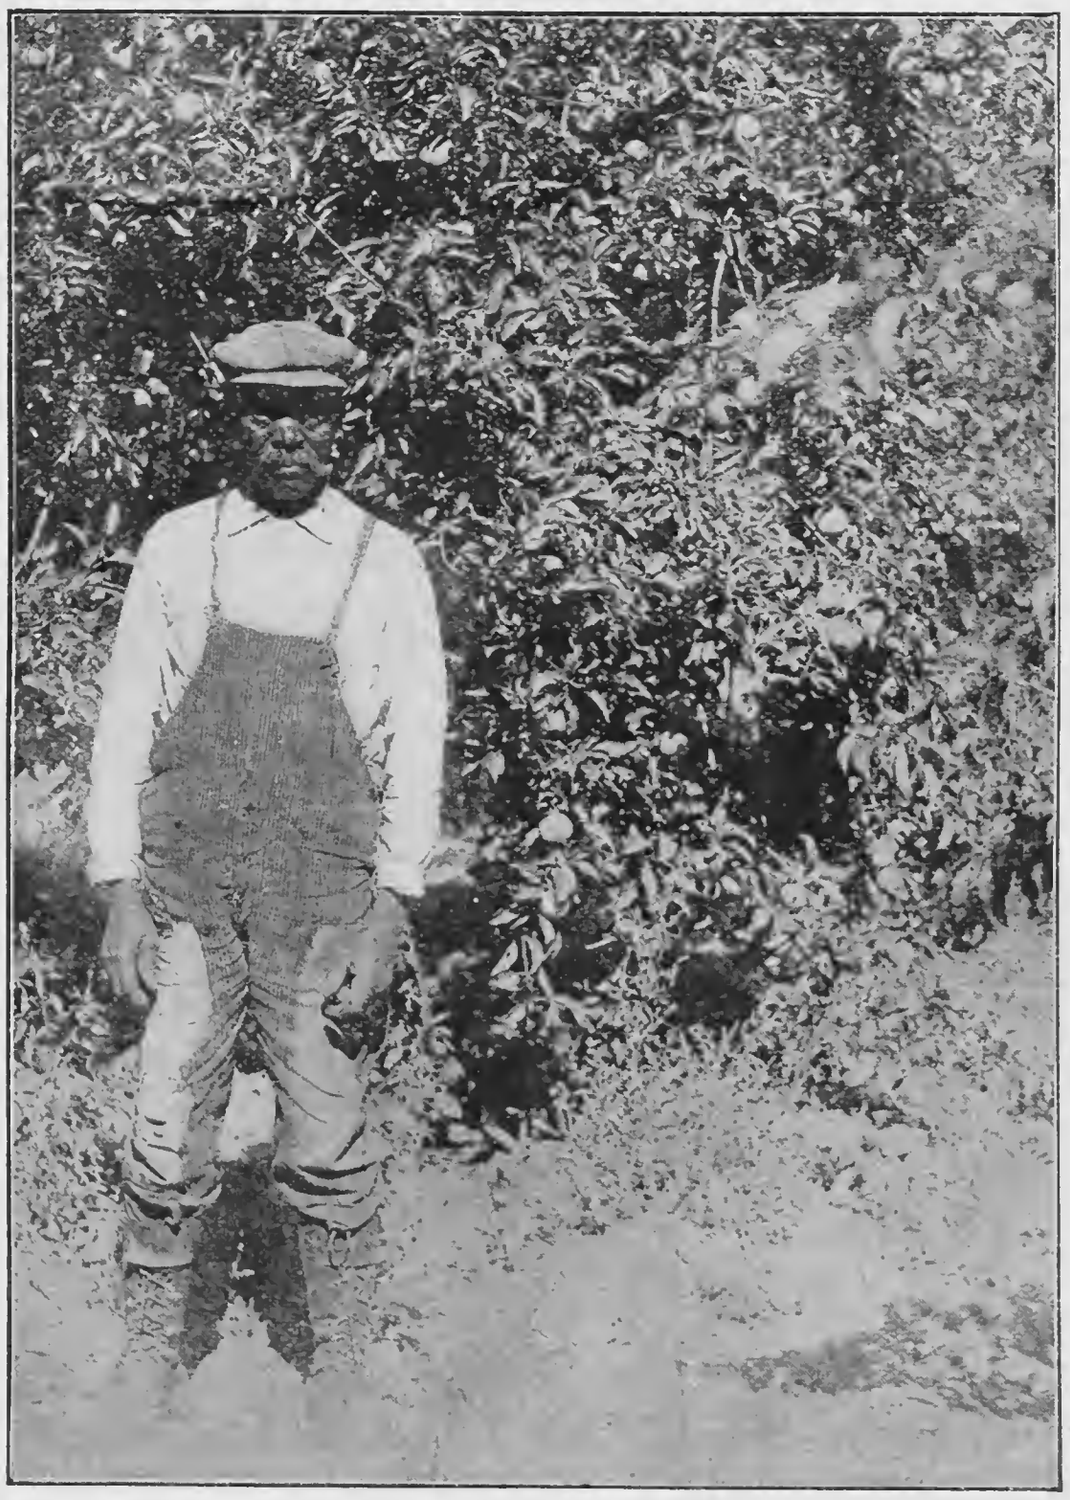


WORLD'S CHAMPION HEN. 303 EGGS IN ONE YEAR. FIG. 24.

All the high record hens we have here have been developed at the Station from an original stock purchased from poultry breeders in different parts of this State six years ago, and in a flock of 40 this year we secured the two world champions; five of the 40 averaged 280 eggs each; five sisters, including C521, averaged better than 247 eggs each, and 26 of the 40 went over 200 eggs; the average for the whole flock being about 210. Every one of them was from a hen that laid over 200 eggs and from a sire from a 200-egg hen. It has been common report heretofore that all great records were made by hens that came from average layers. The results of the nine years' very noteworthy work of Prof. Gowell at the Maine Station, showed that their heavy layers did not have an ancestry of heavy layers. While we have had heavy layers from average or medium layers, our high records are all from high record hens. We have no high records from poor producers. When our records are all tabulated and published I think they will offer much encouragement to the poultry breeder.

I believe the value of the trap-nest, or in other words the importance of individual selection in poultry breeding, has not been emphasized enough or appreciated at its real value. When it is considered with what rapidity a flock of hens is reproduced, the possibilities that open up in the way of rapid increase in poultry production are surely great. The trap-nest will, I believe, do as much for the world in the way of increasing food production as the Babcock test has done. Both emphasize the value of the individual and minimize the importance of breed. Rather it is a question of breeding than of breed. Where would the dairy industry have been, or any other livestock industry, if breeding had been based on the average of the herd rather than on the individual?

Another thing that must be considered if we are to make rapid progress in breeding for eggs, is the futility of breeding for a great many points that have no connection or correlation with egg-laying qualities. We all believe in beautiful fowls, that is, we like to see beautiful chickens, but we can have beauty without insisting on points that are not necessary from a standpoint of beauty nor desirable from the standpoint of utility. We can't expect to make progress in breeding for eggs if we are to follow a standard in our breeding that insists on 20 or 50 points of no value except in the show. If we do it will mean that it will take 100 or 1,000 years to accomplish in egg production what might be accomplished in 10 or 20 years. A profitable poultry industry must be built upon a system of breeding that encourages rather than retards the one essential thing, the improvement of productive qualities. This is the one improvement of most vital importance to commercial poultry raising.



JOHN HILL, THE FAITHFUL HIRED MAN. FIG. 25.

A FAITHFUL HIRED MAN.

A Fine Record in Fruit Culture.

John Hill was born in Charles Co., Maryland, in 1839. He served through the Civil War in the Eighth Maryland Regiment. At the close of the war, in 1865, he came North in a carload of colored people brought North by Albert Barnes. He worked on the farms of Western New York. He worked for Mr. Barnes several years, finally moving to Knowlesville, N. Y., where he engaged with Otis Lewis, and afterwards with Harry Frost, in the same neighborhood. From here he engaged with Mr. T. Backer, Medina, N. Y., and afterwards with J. E. Allis, Medina, N. Y., where he has been 27 years—48 years with five men, a pretty good record. Mr. Allis says he is one of the best men he ever had, and has set out more fruit trees than any one man in Western New York. Although Mr. Hill is now 74 years old he is still on the job and does his work well. A model farmer and faithful employe. The picture was taken under a Hubbardston apple tree set by Mr. Hill 24 years ago on the Allis farm. N. E. EATON.

CITY BOY AND AGRICULTURE.

I have been rather interested to read how serious a menace the city-bred boy is to the efficiency of the agricultural college, as voiced by many writers in the agricultural press. I cannot understand why the agricultural college should be expected to turn out a finished product any more than the medical college or the engineering school. Everyone seems to recognize that a graduate of a medical college must spend two years or more as an attendant in a hospital before he can begin to practice. No one expects a newly graduated engineer to have any practical experience

I was brought up in Boston. When I entered college I had absolutely no idea of farming or farm practice. It was costing me about five hundred dollars per year while at college, to say nothing of the time. Was not my time at college too valuable to spend in learning to milk or pitch hay, or drive a team? The faculty had all it could do to find time to give me the theoretical side of farm practice. I had no trouble in learning to milk outside of school and drew $30 per month while doing it. I am now studying in the school of practical experience. I was graduated from college in 1913, and although I do not feel competent to manage a six-hundred-acre farm at the present time, I am learning fast, and I can't see where I would be better off in 1915 if I had laboratory work in milking cows or cultivating while at college. I am sure I could not have had as thorough a foundation in agriculture if I had devoted some of my time at college to getting experience.

As a city-bred boy, I recognize my limitations, and I have set about acquiring practical experience in the only place where practical experience can be acquired, out on the farms, not in the agricultural colleges. Most city boys who adopt the profession of agriculture recognize, as I do, their limitations, and set about overcoming them. The city boys will figure in the future development of agriculture. They have no local prejudices, or family tradition practices to overcome. They have as broad a sympathy for farm practices as the hundreds of farm-bred boys who graduate from agricultural colleges, but stay away from the old farm. ISAAC COLEMAN.

R. N.-Y.—We are very glad to have this point of view. We would like to ask Mr. Coleman if he would not now be better off if he had taken his experience at practical farming before he went to college? No one has questioned the city boy's right to an agricultural education. The only point of the argument is to show that actual farm practice is as necessary as class work.

Preparing Lands for Gardens.

I am thinking of renting a small piece of land for gardening purposes. The soil is light, sandy, about 10 inches deep, and is underlaid with a sandy clay subsoil. The soil is covered with a light growth of sod, is not very rich, and in my opinion is deficient in humus. I wish to grow a variety of vegetables; beans, peas, cucumbers, tomatoes, lettuce, radishes, beets, etc., and to get at least two crops off the same space of ground. This would call for plenty of humus and plant food. The humus I had thought of supplying partly by turning under the sod and partly by the addition of manure. The plant food would he supplied partly by the manure and partly by the addition of commercial fertilizers. If the manure was applied fresh to the land the latter part of February, and plowed under with the sod about the first of March, and the land again plowed about April 10, would the sod and manure be sufficiently rotted by that time to supply the humus necessary for the earliest vegetables, as beets, lettuce, radishes and peas? Or would the manure, not being thoroughly rotted, have any undesirable effect on these vegetables? How many two-horse loads per acre should be applied to this land? In your opinion could this soil be put in fair condition for truck gardening the first season? H. N.

This land should have been plowed latter part of September and seeded to wheat or rye, to be turned under together with 30 tons of rotted manure to the acre next Spring, as early as the ground became dry enough to work. The decaying sod, together with the green and stable manure would not only have supplied a liberal amount of humus, but would have enriched the land sufficiently to produce a fair crop of vegetables the first year. I wish to state here, that ordinary farm land cannot be brought up to a high state of fertility in one year, no matter how well it is manured and worked, as this thorough incorporation of manure with the soil, their subsequent decaying and assimilation, requires time, usually two to three years. In the making of a garden from grass land, it is better to grow sweet corn or potatoes on it the first year, as the quantity of vegetables grown on such land the first year, is rarely satisfactory, and in most cases a very meager crop, and of very low quality, unless the sod is very light, it will not decay enough to allow of much disintegration by vegetable planting time, and it therefore could not be plowed again at that time and be got in proper condition for the raising of vegetables. I would advise that you spread about 20 loads to the acre of rough partially decayed manure on the sod, and plow it under as soon as possible, but not later than the latter part of February; run over it lightly with the Acme harrow (if one is available) to fill in all the interstices with fine soil, and, in the meantime have in preparation about the same quantity of composted manure for Spring use. Turn it over frequently, working up as fine as possible, the finer the better; then just before planting time, broadcast it on the land, and with a good disk harrow run over it at least twice both ways, about four inches deep. This will thoroughly incorporate the manure with the soil, and at the same time, make a well pulverized seed bed. Then before leveling and smothering apply bone-meal or a good complete fertilizer broadcast, at the rate of 800 to 1,000 pounds to the acre. If the plowing cannot be done until Spring, manure as directed above, but I would advise that you grow sweet corn, potatoes and cabbage on the land next year. The following Fall plow all that portion from which the crops have been harvested and sow to either wheat or rye at the rate of two bushels per acre; the following Spring turn the green crop under, together with 30 to 40 two-horse loads of manure, that has been well rotted and fined through composting and turning over during the Winter. By the second year you will have gained considerable knowledge of the work, and will be in a position where you can pretty safely rely on your own judgment in the preparation of the soil, manuring, planting, etc. One thing you should be absolutely sure of before taking hold of this proposition, is that this land is of good natural drainage; low wet land is of no earthly account in vegetable gardening. Such land used for this purpose, has the word failure spelled in letters large enough to cover the whole area within the lines of the undertaking. K.

The New York State Agricultural Society.

The annual meeting and convention of the New York State Agricultural Society will be held in the Capitol at Albany, on Tuesday and Wednesday, January 20th and 21st. Sessions will be held during the morning, afternoon and evening of both days.

In addition to the reports of committees and election of officers, the following interesting program has been arranged for the different sessions:

"One Coöperative Success; and a Plan to Liquefy Mortgage Credits," Lucius C. Tuckerman, Milton.

"A Practical Building and Loan Association," B. G. Parker, President of Gouverneur Building and Loan Association, Gouverneur.

"Farm Mortgage Loans," R. B. Van Cortlandt, Mt. Kisco.

Report of Committee on Coöperation. Chairman, C. R. White, Ionia.

"What the Eastern Fruit and Produce Exchange Has Done," Seth Bush, Morton.

"Coöperative Work of the State Grange," Ezra A. Tuttle, Eastport.

"How Housewives Can Coöperate," Mrs. Julian Heath, President of National Housewives' League, New York.

"Work of the State Bureau of Coöperation," Hon. Marc W. Cole, State Department of Agriculture, Albany.

President's Address: George W. Sisson, Jr., Potsdam.

"Market Roads for the Farmer," Hon. J. N. Carlisle, State Commissioner of Highways, Albany.

"Lessons in Agriculture from the Far East," Prof. Charles H. Tuck, Cornell University.

Report of Committee on Development of Agricultural Resources. Chairman, James W. Wadsworth, Jr., Mt. Morris.

Report of Committee on Drainage. Hon. Richard W. Sherman, Chief Engineer, State Conservation Commission, Albany. Discussion by Prof. E. O. Fippin, Cornell University; Prof. B. B. Rodd, Cornell University; Jas. A. D. S. Findlay, Salisbury Mills.

"County Farm Bureaus," M. C. Burritt, State Director of Farm Bureaus. Field Reports: Jefferson County, F. E. Robertson, Agent, Watertown; Oneida County, E. W. Bush, Agent, Utica; Chemung County, G. P. Scoville, Agent, Elmira.

Report of Committee on Agricultural Education. Chairman, Dr. Liberty Hyde Bailey, Ithaca. Address: Dr. Thomas E. Finegan, Assistant Commissioner of Education, Albany. "Agricultural Unification in New York," Dean H. E. Cook, State School of Agriculture at St. Lawrence University, Canton. Hon. Calvin J. Huson, Commissioner of Agriculture, presiding.

Address: Governor Martin H. Glynn. Address: Hon. Franklin D. Roosevelt, Assistant Secretary of the Navy, Washington, D. C.

This programme promises an interesting and instructive convention. It merits a larger attendance. It comes at a time when farmers can well afford a brief vacation, and our suggestion would be to invite your wife to take the journey with you, and both make a holiday of this convention.

The Use of Wood Ashes.

Are wood ashes of any value to young peach and apple trees, and would fine shavings do to mulch strawberries? The soil is light sand. Would the ashes benefit my onion bed, which is black muck? F. O.

Madison, Ohio.

The ashes contain lime, potash and phosphoric acid and are excellent to supply these elements to trees. You should use some form of nitrogen with the ashes to make a complete fertilizer. On the black muck the ashes would be fine for onions, as the muck is rich in nitrogen. We presume you mean the fine planer shavings. They are not the best for mulch, as they pack down over the plants and may smother them. The plants must have air and a coarser mulch is best.

THIS SPRING PLANT
Ellwanger & Barry
APPLE AND PEACH TREES

Apples and peaches are now paying enormous profits. Start your orchard this year by planting the highest grade stock. Our apple and peach trees have no superiors. Every one is vigorous, true to name, and free from defects. Yet our prices are much lower. Note these prices for Spring 1914 only on best stock:

Apple Trees, 100 for $12
Peach Trees, 100 for $ 8

We sell direct to you and save you agents' profits. All shipments are carefully packed and promptly shipped.

ORCHARDING IN WEST VIRGINIA.

What does Mr. Van Deman think of West Virginia west of the Allegheny mountains, as a fruit section? I have a tract of land on the Valley River, seven miles from Fairmont, that I would like to set in fruit if I were reasonably certain of its being a commercial success. The land is 300 feet above the river and is surrounded on the east, north and west by the river. Fruit growing in this vicinity is given no attention, but where there are trees they bear fairly well. What varieties other than Grimes and York (Imperial) would be suitable?

Fairmont, W. Va. L. A. C.

Not long ago I was passing through West Virginia on my way from Chicago to Washington, D. C., and noticed the fact that there were almost no orchards planted from the Ohio River to the crest of the Alleghanies. The land is good enough and the climate also for fruit trees, as the few that had been set gave evidence. And this is a region where there are good markets for fruit at the mines and manufacturing towns. It would seem to me that there is a good field there for tree planting, and there are some very successful orchards there now, especially in the southwestern part of West Virginia and many more east of the mountains, in the valley of the Potomac and its tributaries. But there need be no fear in planting in the western regions if the land is fertile and well drained. Much of the valley land is good for apples, especially also the slopes and table lands. Peaches and cherries are also well suited to these higher places. I should think the location mentioned as being 300 feet above the river would be excellent for growing almost any kind of fruit suitable to that climate.

As to varieties of the apple there are many good ones besides Grimes and York Imperial that succeed in many parts of West Virginia. The Stayman is one of the best, and its parent the Winesap, as well. Rome Beauty, Delicious, Black Ben and Jonathan are all good kinds for that region. Yellow Transparent, Wealthy and Oldenburg should be used as fillers, the permanent trees being of the varieties formerly named, mainly, and set 50 feet apart, the fillers standing in the space between, making the complete orchard 25x25 feet apart. Stayman, Grimes and Winesap make very good fillers also ,and will not need to be dug out for about 20 years. Do not use peach trees as fillers, because they injure apple trees by their rampant growth.

H. E. VAN DEMAN.

SUNFLOWER CROWING IN MARYLAND.

As there seems to be a desire for records of experience in the growing and feeding of sunflower seeds for poultry, perhaps the results of an experiment made last Summer by the writer may be of interest to some of your readers. We have a gravelly hillside with westerly slope, shaded from the morning sun by buildings. This hillside is set to apple and dwarf pear trees, and enclosed as a chicken run. We wished to grow some kind of crop between the tree rows as an excuse for cultivation, but the land is too poor for potatoes, and the hens would eat up most other crops. The plump, meaty look of some sunflower seeds bought for chicken feed suggested the planting of sunflowers.

The land was treated to a fair coat of stable manure before plowing, and to sulphate of potash at the rate of 200 pounds per acre in the row at time of first cultivation. Plowing was difficult, as the ground was baked so hard that it was almost impossible to keep the plow in the furrow. However, by the use of cultivator and harrow, aided by a timely shower, we obtained a fairly smooth, though shallow bed. The planting was done with a hand seeder in rows three feet apart, hills 18 inches, about five seeds to hill, covered 1½ inches deep, the planting covering a strip 90 feet by 150 feet. The plants came up well and were thinned after first cultivation to two plants in each hill. Attempts to reseed and reset vacant hills failed.

About 60 hens had the run of the yard, but they did very little harm either to the seeds or to the growing plants. Our only loss was from rabbits, which burrowed under the fence and ate the tops off a few plants. The crop was cultivated with horse three times and hand-hoed once. After the plants were three feet high they shaded the ground sufficiently to keep down the weeds. When the heads grew heavy with maturing seeds and bent near the ground, the hens were shut out of the field for a few weeks until the crop was gathered. As the seeds ripened and became loose the English sparrows took heavy toll, especially of the smaller seeds. To save the crop from the sparrows and clear the field for the hens the harvesting was done as soon as the seeds could be beaten out easily with a stick. The heads were cut from the stalks and placed to dry on a warm south slope covered with sod. In spite of favorable weather, however, they gathered moisture from the ground, so that the pulp surrounding the seeds soon became soft, making it difficult to separate the seeds. About 10 per cent. of the crop was lost in this way. The shelling was done by holding the heads over a basket and beating with a square stick about 18 inches long and three-fourths-inch diameter. The seeds, amounting to 21½ bushels, were spread on attic floor for a few weeks, and stirred from time to time until thoroughly dry, then placed in bags ready for use as needed. We have had no loss from insects, but a neighbor, three miles away, lost his entire crop by some kind of weevil that ate the kernel out of nearly every seed. Our gratification at getting any returns at all under the circumstances from this bit of land is tempered by the thought that we might have done much better. The plants were altogether too crowded, as shown by the fact that while the heads near the border were 10 to 16 inches across, those toward the center were hardly half as large. E. C. O.

King, Md.

TOMATOES IN SOUTH CAROLINA.

I wish to follow my lettuce with tomatoes, and will in making the lettuce have applied 1½ tons per acre of 6½: 6½:10 and 200 pounds of nitrate of soda. I can get these tomatoes set out by March 15, which is early enough in our latitude. Would you advise as to fertilizer best adapted to side-dress these tomatoes under above conditions, and probably the best tomato for shipment, while the market was right and for canning afterward? I have been troubled with decay in blossom end just as tomato was turning. Will you give cure and probable preventive? This occurs whether stable manure is used or not.

Danfuskie Island, S. C. A. H. S.

The following is almost a perfect manure for this crop and you will no doubt find it will meet your every expectation in requirement: Phosphoric acid, 8 per cent.; equivalent to ammonia, 2 per cent.; soluble potash, 2 per cent. This compound is largely used by farmers who supply canners with tomatoes. It has made good in every instance. The question as to which is the best variety to grow for market and canning, is a matter of opinion among gardeners, and this opinion is as varied as the locations in which the tomato is grown. I have tried about every variety introduced in the last 30 years, but have found none that ever gave me better results than the old Paragon. It is early and handsome, of good size, perfectly smooth and regular, very solid and a good keeper; the color is of a bright glossy crimson. This variety some years ago was considered the standard of perfection, and was perhaps more extensively grown for market and canning purposes than any other variety. Many of the seedsmen have for some reason discarded it, and substituted other sorts, many of which never have been as good all-around tomatoes as the old Paragon. It is good and makes good where some of the later introductions are at a discount. The Stone, a later introduction, is considered by many gardners to be the best general purpose tomato on the market to-day. In my experience with it I found it a very shy cropper and the plants short-lived, under ordinary conditions such as the average grower must provide for this crop.

The rot spoken of is due to adverse climatic conditions, and will occur when these conditions are present, regardless of the kind of soil they are grown in or the kind of manures used. There is no remedy for it, as the fungus starts growth within the fruit, and for that reason any applied remedy will prove unavailing. Pick off all affected fruits as soon as discovered and destroy them.

K.

Kelly's TREES

Direct from the Grower to Your Orchard at Wholesale Prices

We have grown thousands of splendid quality Fruit Trees, Small Fruits and Ornamental Stock, here in our nurseries at Dansville, right in the heart of the nursery-growing district, and offer them to fruit growers at very low prices.

All our splendid fruit trees are

GUARANTEED STURDY AND TRUE TO NAME

and free from disease of any kind. Kelly Fruit Trees are the result of 27 years of careful nursery experience. Each one of the Kelly Brothers has a department, so from seedling to freight car we know the history of every tree; know that our varieties are true to name; know that we send you the varieties you order; know that the trees you get will be satisfactory in every way.

It means something to a fruit grower to know that Kelly Trees are

Grown, Dug, Packed and Shipped under the personal supervision of the Kelly Bros.

You can order from our catalog just as if you came to Dansville in person. We would be glad to have you visit us and look over our stock—but if you can't come, order from our catalog and you will have just as good treatment, for

EVERY ORDER RECEIVES PERSONAL ATTENTION

We have put our nursery business on a scientific basis. We have every up-to-date tool and modern office and shipping equipment. We have lowered the cost of producing nursery stock, and as our catalog is our only salesman we give our customers the advantage of low prices on quality stock delivered promptly from our nursery.

Built to stand up under hard work, and so constructed that they put the spray where you want it, and combine maximum power and strength with minimum draft weight, so that they won't kill horses on rough, heavy ground.

Little Giant Orchard Power Sprayers

are built in two sizes with tanks of 200 gallons and 100 gallons capacity. Both are equipped with a special pump of our own make, especially powerful, easy working, and so simply constructed that every part is accessible.

The Pump With The Clutch

is a Little Giant feature. By throwing out the clutch the pump may be stopped without stopping engine or interfering with agitator. It's a great advantage to be able to crank the engine without having the pump attached. You can also mix your solution thoroughly before starting spraying.

Little Giants are giving extra satisfactory service to many growers. It will be worth your while to write for our catalog and prices.

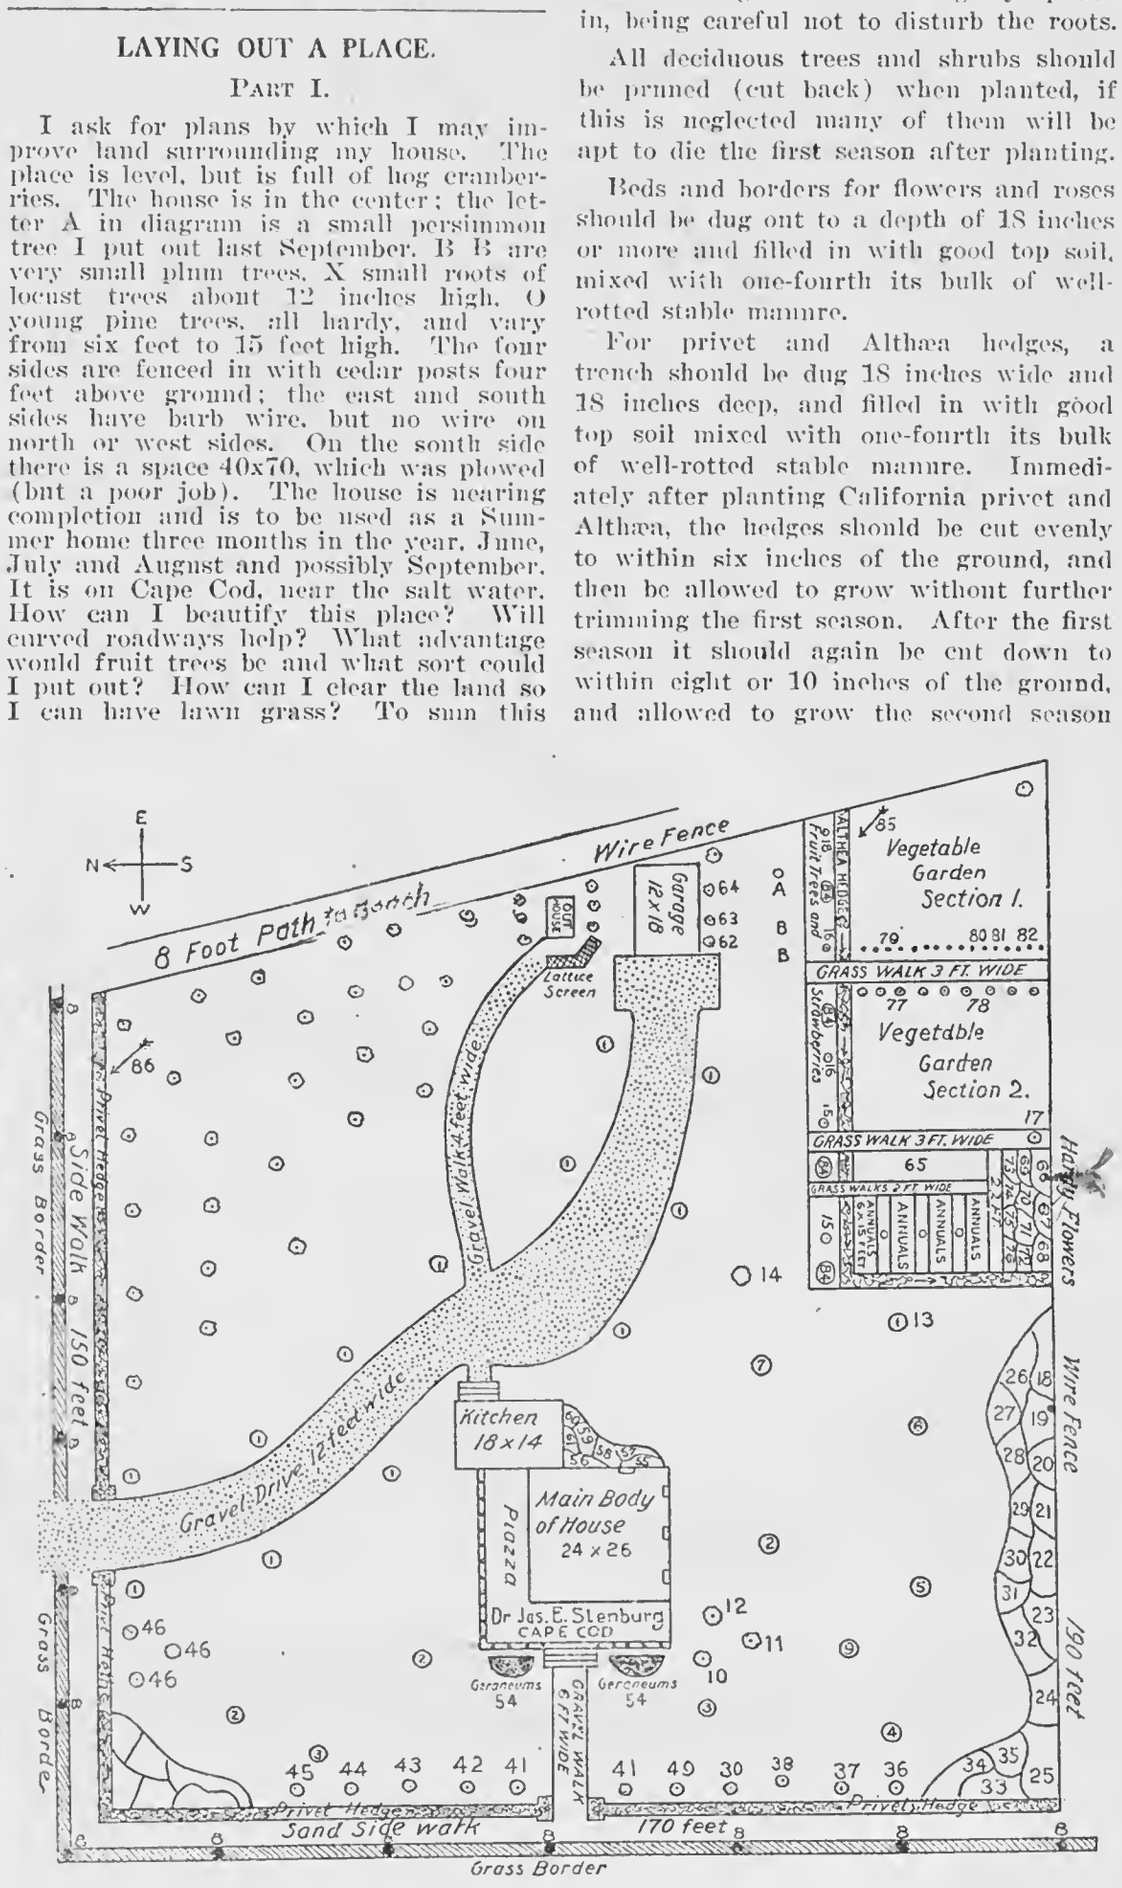
LAYING OUT A PLACE.

PART I.

I ask for plans by which I may improve land surrounding my house. The place is level, but is full of bog cranberries. The house is in the center; the letter A in diagram is a small persimmon tree I put out last September. B B are very small plum trees. X small roots of locust trees about 12 inches high. O young pine trees, all hardy, and vary from six feet to 15 feet high. The four sides are fenced in with cedar posts four feet above ground; the east and south sides have barb wire, but no wire on north or west sides. On the south side there is a space 40x70, which was plowed (but a poor job). The house is nearing completion and is to be used as a Summer home three months in the year, June, July and August and possibly September. It is on Cape Cod, near the salt water. How can I beautify this place? Will curved roadways help? What advantage would fruit trees be and what sort could I put out? How can I clear the land so I can have lawn grass? To sum this improvement in the general layout, such as walks, shade trees, a garden and a fence, either hedge or something that will look well. J. E. S.

Boston, Mass.



PLAN FOR GROUNDS OF COUNTRY HOME. FIG. 26.

For specimen trees and shrubs (individuals located by individual numbers) holes should be dug 2½ feet in diameter and two feet in depth, and filled in with good surface soil mixed with one-fourth its bulk of well-rotted stable manure. The entire space to be occupied by massed planting of shrubs and plants should be prepared by trenching. Commencing at one end of the ground to be trenched, a space, say five feet wide is dug out one spade deep, and the surface soil thrown to one side. The subsoil is then dug up to the depth of one spade and mixed with one-fourth its bulk of well-rotted stable manure, and then a second section five feet wide of the surface soil is taken out to the depth of one spade and thrown on top of the first section of spaded and manured subsoil, and the second section prepared the same as the first. These operations are to be continued until the entire space of ground to be prepared is gone over, when the top soil that was thrown aside from the first section is removed to, and placed on top of the subsoil in the last section. After digging two inches of well-rotted manure should be added to the surface soil and mixed with it. Sod should be carefully edged up to these plantings as shown on plan by the regular lines enclosing them.

The surface of the soil about all plantings should be mulched liberally with coarse strawy manure every Fall. This mulching will be a good protection to the roots in Winter, and the leachings from the manure will enrich the soil and promote growth. All the roughage should be raked off in the Spring and the remaining fine manure lightly spaded in, being careful not to disturb the roots.

All deciduous trees and shrubs should be pruned (cut back) when planted, if this is neglected many of them will be apt to die the first season after planting.

Beds and borders for flowers and roses should be dug out to a depth of 18 inches or more and filled in with good top soil, mixed with one-fourth its bulk of well-rotted stable manure.

For privet and Althæa hedges, a trench should be dug 18 inches wide and 18 inches deep, and filled in with good top soil mixed with one-fourth its bulk of well-rotted stable manure. Immediately after planting California privet and Althæa, the hedges should be cut evenly to within six inches of the ground, and then be allowed to grow without further trimming the first season. After the first season it should again be cut down to within eight or 10 inches of the ground, and allowed to grow the second season without further trimming. The hedges will now be well filled out near the ground. The privet should be lined up to the height it is desired and cut back evenly to the line on top. The sides should be likewise lined and trimmed. Subsequent shearings with the hedge shears during the growing season will keep the privet hedge at the proper height and width. To have the Althæa hedge make the best show, it should be cut down to within 10 or 12 inches of the ground every year in early Spring. It will then bloom on the young wood, almost from the ground up, thus making a fine show at a time when no other shrubs are in bloom (midsummer).

For small evergreens, the holes should be dug 18 inches deep and two feet wide, and good top soil only, used in the holes when planting. A mulching of coarse manure around them on the surface will retain moisture and help keep the ground cool during Summer.

All the cranberry bushes should be grubbed out, after which the ground should be deeply plowed, when it should be smoothed and leveled. Then apply a liberal coat of fine well-rotted manure and spade it in three inches deep and before raking apply air-slaked lime at the rate of one ton to the acre, spreading it evenly. Now rake the ground level and roll with a heavy hand roller, after which go over the ground, filling in all depressions and leveling off all bumps. Then roll cross-ways; go over the ground again raking soil into all low places and leveling down all bumps. After which it will be ready for seeding to grass, which should be of a mixture suitable for the seashore. Sow at the rate of five bushels per acre. K.

The Home Acre.

Peas and Radishes.

I can raise everything but radishes and table peas in my flower and vegetable garden. The bugs and worm get on these when the peas are 2½ inches high, and they fall over. How can I treat to raise good healthy peas? Worms get on radish roots. What can I do for them?
East Cleveland, O. J. D. L.

The insect referred to as attacking your peas is probably the pea aphis, which of late years has become very troublesome in many sections of the country, particularly where peas are grown in large acreages from year to year. The remedy most largely used to combat them is kerosene emulsion spray, which can be purchased at any of the leading seed houses. Use according to directions. The following will also prove effective: Fir tree oil soap, lemon oil soap, potash, fish-oil soap, or strong soapsuds applied as a spray, at intervals of a week or 10 days. I would advise that you change this location for planting yearly, and use only well-rotted manure in moderate quantities, and if the soil is light and disposed to dry out quickly, to firm the soil well in the rows with the feet at time of planting. This will prevent the air reaching the roots, which is invariably more or less injurious to the plants, and sometimes causes a complete failure of the crop.

Radishes, are very subject to the attack of root maggots, particularly when grown in soil that has been repeatedly fertilized with stable manure. The following remedy will be found quite effective: To one-fourth pound of soap boiled in one quart of water, add when removing from the fire one pint of crude carbolic acid, dilute the whole with from 10 to 12 gallons of water, and apply along the rows a couple of days after the plants are up, and at intervals of eight or 10 days. Usually two applications are sufficient to free the crop from this pest. This remedy will be found quite effective in the treatment of cabbage, cauliflower, etc., that are suffering from an attack of the root maggot. K.

Trouble With Lindens.

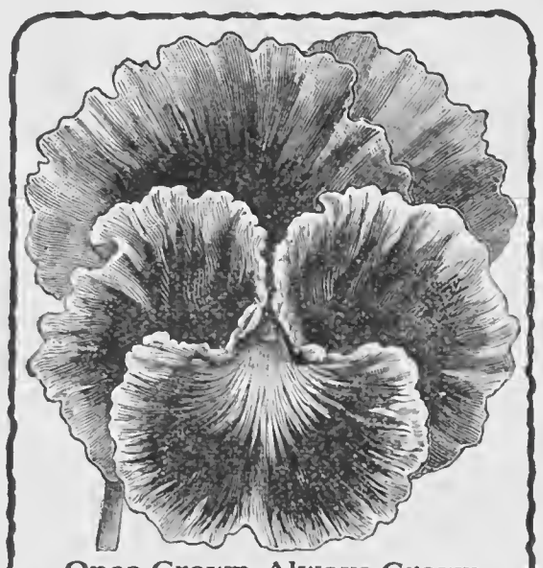
Four years ago last Spring I planted six linden trees. They all grew very nicely until last Spring, when I noticed one of them being slow in budding, and the leaves did not come out until two or three weeks after the others, and looked rather weak. Examining the trunk I found the bark loose on one side about 12 inches above the ground. I cut this part out and put grafting wax across the edges, but later the bark got loose all around and the tree died. I have now found the same trouble on another tree, but as it is yet very little I believe this tree can be saved. Will you tell me what is the cause and what can I do to save the other trees? I believe that there is some kind of a borer as I have found some small holes in the bark and a mealy stuff like fine sawdust inside.
Rockville Center, L. I. B. E. K.

I am unable to tell the author of the above question, just what is wrong with his lindens. I had the same experience a few years ago. The Spring of 1908 I planted three European lindens; they made a very satisfactory growth that year, with no visible signs of sunscald or any other bark trouble, but the next Spring one of them did not leaf out, and the other two barely unfolded their leaves in a feeble attempt to grow, but soon gave up the ghost. Upon careful examination I found the bark in exactly the same condition described in the above letter, and upon digging them up I found the roots dead, and so far as I could see the roots had never thrown out a fibre, nor had the cut roots callused the least bit. It appeared that some species of fungus disease had attacked the roots, probably at the terminals or where they had been bruised, and slowly followed the roots to their base, perhaps by Fall or early Winter, and for a certain distance up the trunks by the following Spring. I believe that sunscald might possibly produce the conditions he describes. The bark of the linden is soft and spongy, being composed of several papyrus-like layers, which quickly absorb dampness, and on account of its spongy nature will hold the dampness a long time. It is possible these trees were sunscalded the previous Summer and the dead bark becoming saturated with moisture, perhaps early in the Fall, created a favorable ground for the spores of some species of bark disease, either bred within the injured bark or communicated from some other source. The few worms mentioned are in no way responsible for the injury; they are simply an aftermath. The only thing to be done for the trees still alive is to cut out all the dead bark at once, cutting at least one-fourth of an inch beyond the dead line into the live bark; scrape the exposed parts of the wood free from all dead fiber, and paint it with asphalt paint, covering the wound well. This will prevent worms entering the wound, decay, and further infection from any live spores that may be still present on the exposed wood. Remove all bark and scrapings away from root of tree and burn them. K.

Garlic.

What is to be done with garlic on a farm in small patches in the fields? Can you get rid of it, and how? N. L.
Pennsylvania.

The garlic may be dug out with a spade or "spud." This is the surest way. Salt or kerosene put on the roots will kill many plants. If the patches can be plowed, planting with hoed crops with thorough culture will get rid of most of the garlic and constant mowing or clipping of the tops will help.



Once Grown Always Grown

$3,000 from 80 Apple Trees

In 1913 eighty apple trees produced fruit that sold for $3,000.00. They are located on the farm of A. E. Jansen, New Paltz, N. Y. Set 35 feet apart, they cover two-and-a-quarter acres. Planted seventeen years ago, these trees began to bear when seven years old, and haven't missed a crop since. In the last four years their product has sold for $7,200.00.

GOOD TREES MAKE SUCH YIELDS POSSIBLE

Average trees never will do this, though almost any farm can duplicate this record with good trees. It requires, first, an inbred superiority in bearing got direct by buds from heavy producing parent trees. Then the young trees must have enormous fibrous root systems, and thick, straight, clean trunks.

That's the kind of trees we grow. The peculiar combination of soil and climate on the "Eastern Shore" produces trees which seldom are equaled elsewhere. Our trees are larger and straighter and cleaner than most others. They are hardy anywhere, grow rapidly, bear early, and always yield to the limit. Get our 1914 catalogue and learn how these superb trees are grown. It's a most valuable book of information—worth keeping, and sent on request.

R. H. SHUMWAY, Rockford, Illinois

ASPARAGUS FOR HOME MARKET.

The growing of asparagus roots for sale is mainly in the hands of professional planters, seedsmen and nurserymen, and it is a very profitable undertaking for them. Now here is, I believe, a splendid opportunity for at least one person in each community to realize quite a little extra money with a minimum of space and effort.

The demand for asparagus is universal; everyone likes it. To think of asparagus growing naturally calls to mind the finished product, but some one must first start the seed and furnish the plant. Why not you? Hardly a home garden is without its bed for table use. Not one out of a hundred grew their plants from seed, but bought from a catalogue or agent at prices ranging from $1 to $3 a hundred, and a good farm wife told me not long ago that she had been induced to pay $3.50 for 50 asparagus roots. There is good money in retailing asparagus roots at 60 cents a hundred, which is the price the writer obtains locally.

My asparagus seed bed is 80 feet across, and I put in the seed in early Spring, carefully one at a time an inch apart across the bed, and five rows each an inch apart, thus making a row five inches wide, 80 feet long and containing 4,800 seeds. I had a dozen or so such strips. As the seed is very slow to germinate I marked the rows with radish seed, a seed say each six inches, which gave me more radishes than I could use before the asparagus came up. The ground should be rich to induce a heavy growth the first year, and hand weeding under the above arrangement will have to be resorted to. But with average germination you should have a stand of 4,000 plants to such a row, which would retail for from $12 to $15 or about $2 per square foot. However, unless you felt sure of marketing the crop the first Spring, I would sow the seed two inches apart instead of one.

I believe, if you intend to sell locally only, that it is conservative to plan for an annual output of 1,200 plants, or roots, to each 200 homes in your selling territory. You will have sales occasionally up into the thousands, but the average family buys 100 roots. A family of five or more where all like it, should have a bed of 200 roots at least.

A classified advertisement in the county paper has been my best means of advertising the roots, as well as other things I had for sale. A fair proportion of orders came from out of town, say within a radius of five miles. Reports from nearly all customers last year evidenced the fact that they had had much better results in getting the roots to grow than from those that they had tried previously. This was probably due to the fact that locally purchased roots could be set the same day as dug.

Government and experiment station tests have repeatedly shown that one-year-old roots ultimately produce the greatest yields. Set forth this fact in your advertising and market the one-year-old roots if possible. You will, of course, have to charge more for two-year roots because they have taken your time and space, but your buyer is not getting as much for the money as in the first case.

Michigan. P. L. W.

HANDY DISINFECTANTS.

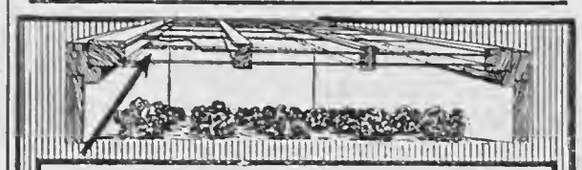
A GERM AGE.—In this heyday of germs when these microscopic plants are held responsible for almost everything, from souring the milk to causing typhoid fever, everyone is interested in knowing how to destroy them. Not all germs are bad; we couldn't live without them, and in some cases we can't live with them. Neither are they anything new. Adam ate and drank as many as we do, though his family physician never reminded him of it, and if his family suffered less from them than we do it is probably because they slept under the fig trees and Eve never packed away any scarlet fever germs with the children's Winter underwear.

AIR AND SUN.—The word disinfectant has become a household term, and almost everyone knows that it means something that destroys germs, though comparatively few know what our best and cheapest disinfectants are. The most useful and efficient all-round disinfectant that we have is the sun, and the air is his worthy ally. Fresh air dilutes germs as water dilutes filth, and the lustiest germ will quickly curl up its toes and die if exposed to the sunlight. But fresh air and sunlight are abundant and cheap, so, of course, we usually prefer to use some disinfectant that smells bad and can be bought at the drug store. Open windows and rolled up shades would save many lives, but what do we have windows and shades for if not to keep them down? Besides, if we left them up, it would let in the flies and fade the carpets; so we pamper the germs and employ the doctor.

HEAT HELPS.—Next to the sun, our best and cheapest disinfectant is heat. Fuel costs something, but heat, after all, is cheap. We need it in only sufficient degree and applied where we want it to destroy any germs that threaten us. As fresh air helps the sun, so moisture helps heat. For this reason, boiling water and steam make almost ideal disinfectants. They combine a temperature of 212 degrees with moisture, and this is enough, though if boiling water is used to kill germs, remember that it must be boiling; otherwise it will not have a temperature of 212 degrees and it will simply scald without killing. Most germs don't mind being scalded, a bit. For clothing, bedding, dishes, and anything else that can be boiled there is no other disinfectant equal to heat. Put these things into a washboiler, place the cover on, and set upon the kitchen stove to boil for a half-hour, and the wickedest germ that ever leered over a foot-board will be done to a mush.

DISINFECTANTS.—But we sometimes wish to disinfect things that we can neither boil, burn, nor hang upon the clothesline in the sun and air. So we need some smelly stuff from the drug store. Of these things, corrosive sublimate with water is very efficient, but it is a poison, and the tablets into which it is made for convenient use are too frequently mistaken for medicine and swallowed. Carbolic acid with water is also a splendid disinfectant, but this too is a corrosive poison and a little dangerous to have about the house. Safer than either of these, and about as effective, is chloride of lime. This may be purchased at the drug stores, but much of it found there has deteriorated and become worthless. Good chloride of lime should give off irritating fumes that the face cannot be held near it without irritating the eyes. A reasonably fresh preparation of chloride of lime dissolved in water, one pound to two gallons, makes a splendid disinfectant for privies, sinks, drains, for use in bed-pans, and with such things as may be placed in it. The fumes will bleach many colored fabrics, however, and this sometimes limits its use. It is also a powerful deodorizer, and the dry powder may be sprinkled over the contents of vaults, decaying animals, and in places where it is desired to sweeten the air. But deodorizing doesn't kill germs, it only hides them; remember that. M. B. D.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.



NOW'S THE TIME TO GAIN ON SPRING

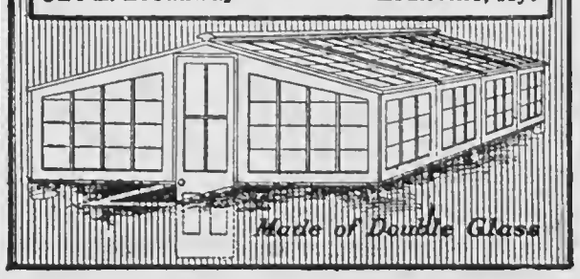
It matters not what the outside weather is, there are always growing conditions under **Sunlight Double Glass Sash.**

You need these sash to begin right. They capture the sun's rays and liven up and warm the hot-bed and cold-frame during the day and the heat then stored is conserved over night by the two layers of glass and the dead air space between them. Mats or shutters are never necessary, saving half the cost and labor.

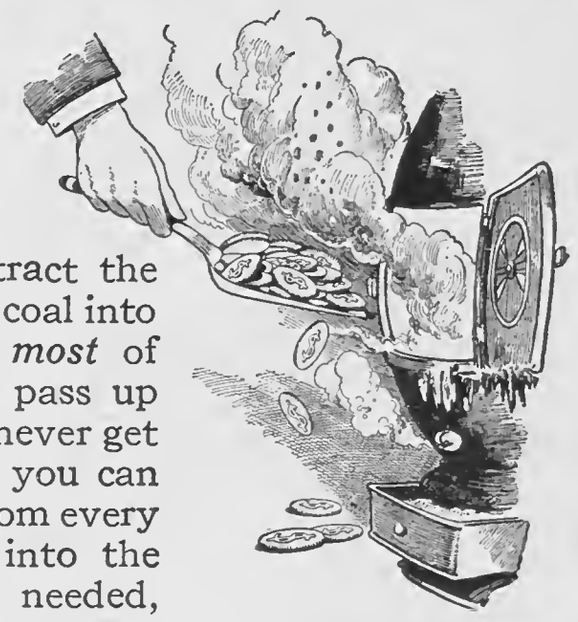
The Sunlight idea has been carried into a small, inexpensive Greenhouse. It is made of Sunlight Sash, which are instantly removable for use on hot-beds or cold frames. Serving a double purpose and requiring little artificial heat, this greenhouse is very inexpensive.

Get our free Catalog. If you want Prof. Massey's valuable book on hot-bed and cold-frame gardening, send four cents in stamps.

Sunlight Double Glass Sash Company
924 E. Broadway - - Louisville, Ky.



Don't waste heating dollars



The heat-making value of a pound of coal is as fixed as is the number of cents in a dollar. Whatever heat-value you get from coal in room-comfort depends on how you burn it—how you extract the heat. You can shovel much coal into old-fashioned heaters, yet *most* of the heat-making gases will pass up the chimney unconsumed—never get your money's worth. But, you can have *all* the available heat from every ounce of coal distributed into the rooms just where and when needed, by using our

AMERICAN RADIATORS & IDEAL BOILERS

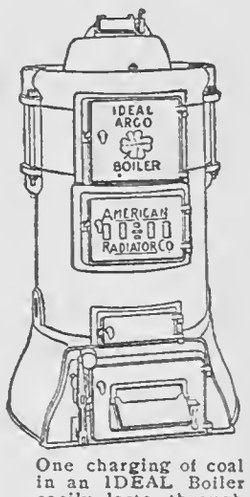
The deep, large fuel-chamber of an IDEAL Boiler is one of the strong features for producing fuel savings—it offers best conditions for extracting heat. A deep, slow fire is easily proven best as compared with the shallow firepots of old-fashioned heating methods—just as a big cake of ice which fills the refrigerator box gives far steadier, more economical results than you get from frequently throwing in a handful of cracked ice. We also make wood-burning IDEAL Boilers.

What the IDEAL Boiler starts in heating economy the AMERICAN Radiators finish by distributing warmth in all rooms, evenly, throughout every hour of the day, just sufficient for differing requirements of mild, medium and severe weather; or you turn the radiator off in any unused rooms and *save the heat.* Besides, there is far less house-labor, because no soot and ash-dirt go to the rooms, as with old-time devices. No lugging coal and ashes up and down stairs.

A No. 1021 IDEAL Boiler and 262 ft. of 38 in. AMERICAN Radiators, costing owner $165, were used to heat this cottage. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which are extra, and vary according to climatic and other conditions.

IDEAL Boilers and AMERICAN Radiators can as easily be put in old as in new houses—farm or town. The same water is used over and over again—for years. Fire need not be rekindled in a whole winter season.

If you are weary of ever-lasting blackening, repairing and coaxing, discard at once the old way and put in an IDEAL-AMERICAN outfit at this season, when you get best attention and most favorable prices. Send for free booklet—"Ideal Heating" which explains how to get full returns from every heating coal bill.



One charging of coal in an IDEAL Boiler easily lasts through the longest zero night. There can be no fuel waste.

Showrooms in all large cities

AMERICAN RADIATOR COMPANY

Write to Dept. F9 Chicago

Use the *Available* Kind of Fertilizer

For many crops all the *available* plant food that is needed is one grain to each pound of soil.

When such a small quantity of food must do all the work for your crop, it is exceedingly important that what you put into the soil in the form of fertilizer shall be *available*—that it shall have not only the right quantity, but the right quality and right crop value.

It has cost us forty years of experience to know how to mix the right kinds and the right quantities of ingredients for fertilizer.

Bowker's Fertilizers

accomplish also the more difficult task of getting the right blending, the right solubility into a mixture which will run readily and freely from the farmer's planter, and which will remain dry and drillable as well as efficient until used in the field. We make a brand to fit every crop need.

Write and tell us what your crops are, and we will send you our illustrated catalogue.

Catawba-Concord Grapes.

Can you tell us anything about the Catawba-Concord grape? Does it prove all the claims made for it? W. F. B.
Ann Arbor, Mich.

The Catawba-Coneord is a comparatively new production, fruited for the first time the past season. However, the fruit was grown from wood of the Catawba-Concord grafted upon a six-year Concord root. The grafting was done in the Spring of 1912. But a few small elusters, due probably to Winter killing of buds, as a result of but one rank growing, some having developed the previous season. The quality of the fruit indicates that the variety possesses possibilities. Another year we expect to fruit it on its own roots. F. E. G.

Removing Large Stump.

When I laid out my place 15 years ago, a poplar tree was planted on a terraee bank on the corner of my stable. It died last Summer and I have had it cut down. It has left a large stump, about three feet wide. How can I get rid of it, as I want to plant a Red cedar where it was? It cannot be dug out, as it would destroy many shrubs planted near it, and cannot be blasted out as it would disturb the foundations of my stable. My old colored man says he thinks holes could be bored in it and something put in these holes. FRANK H. PRESBY.
New Jersey.

The papers often contain stories about using saltpeter to "rot out stumps," but such a plan will not satisfy you. Under the circumstances we should try the following: Dig the soil away from one side of the stump and get some expert wood chopper to cut it off as far below ground as possible. Cut it much the same as wooden meat blocks are cut off. Then bore several holes in the stump and pour in kerosene. Build a little furnace of brick and soil over the stump with a long stove pipe runing out from the side away from the barn. Leave an opening in the other side for draft and start a fire with kindling on top of the stump. By watching the fire carefully and blowing in on feed draft, you can burn the stump down to the roots. Leave the ashes in, fill with soil and plant.

New York State Fruit Growers.

The New York State Fruit Growers' Association started their program on January 7. In addition to the usual reports of committees, there were addresses by the following persons: Prof. E. P. Felt, of Albany, as State Entomologist, and Prof. Glenn W. Herrick, of Ithaca, spoke on the fruit-tree leaf-roller and its control. Prof. F. C. Stewart, of Geneva, and Prof. Donald Ruddick, of Ithaca, discussed plant diseases; and Prof. P. J. Parrott, of Geneva, talked on spraying. Mr. Edward Van Alstyne had charge of the question box. Prof. F. C. Sears, of Amherst, Mass., gave the story of his six years' experience in running a fruit farm. Seth J. Bush, of New York, discussed the problems of peach production, and also of coöperative marketing. Prof. A. P. Sandles, of Columbus, Ohio, was also down for a talk.

Prof. U. P. Hendrick, of Geneva, gave a report of his experiments, covering the past 10 years, on sod muleh vs. culture. There was also a prize speaking contest open to students in the Department of Pomology at Cornell. Dr. W. H. Jordan, of Geneva, discussed the relations between Federal and State Agricultural Extension Service. Prof. C. S. Wilson, of Ithaca, gave an address on packing apples. Dr. W. J. Spillman, of Washington, discussed the cost of growing apples, and Prof. H. B. Knapp, of Ithaca, compared prices of apples for 10 years. Mr. F. E. Gladwin gave the story of a five-year fertilizer experiment with grapes. and O. M. Taylor, of Geneva, started a discussion of bush fruits. There was the usual tremendous exhibit of fruit, in charge of Mr. Geo. R. Schanber, and a great exhibit also of all appliances and materials and machinery needed for cultivating or caring for fruit.

A LOCAL paper tells of a clergyman who received this note telling him to perform a marriage ceremony: "This is to give you notice that I and Miss Jemima Arabella Brearly is coming to your church on Saturday afternoon next to undergo the operation of matrimony at your hands. Please be prompt, as the cab is hired by the hour."—London Opinion.

COMING FARMERS' MEETINGS.

Massachusetts Fruit Growers' Association, convention and trade exhibit. Springfield, Mass, January 15-17.

New York State Agricultural Society annual meeting and convention, Albany, N. Y., January 20-21.

HIGH pressure spraying is 100% efficient. The more thorough the spraying operation the greater is the profit from the crop.

Hayes Sprayers are *guaranteed* to maintain 300 lbs. pressure. 300 lbs. pressure completely atomizes the solution into a penetrating fog-like mist that *seeks out* and *adheres* to every particle of foliage. The atomization is so perfect that drops will not form on the leaf and fall off.

Hayes Hand & Power SPRAYERS

INSIST ON YOUR DEALER FURNISHING SEED OATS IN BAGS BEARING THIS TAG

Fancy Recleaned
SEED OATS
FROM
TIOGA MILL & ELEVATOR CO.
WAVERLY NEW YORK

FRONT

These are SELECTED STOCK from which false oats, light oats and pin oats have been removed leaving only the best heavy oats. They have been recleaned to remove foul seed and dirt and before shipment have been tested to insure high germinating qualities.

If you plant oats to raise oats and get the largest returns for your work and investment, it will pay you to plant only seed that will grow and produce strong plants. False and light oats will not grow, and pin oats grow pin oats. Good oats with strong germinating qualities produce stronger plants, insuring larger returns.

BACK

The Bastian "Oregon" Pruner

Operates with a simple pump-gun action upon a most powerful compound leverage, enabling you to cut, with a quick pull, a small twig or a limb an inch thick. This pruning hook is light but very strong, powerful and durable. The natural position of your hands on the pole-handle gives ease, speed and accuracy of operation. All side-strain is eliminated as the compound leverage principle places the strain lengthwise of the pole. The perfectly tempered and ground Sheffield Tool Steel blade makes a clean, smooth cut—there's no chance for it to pinch or bind.

THE BASTIAN "OREGON" PRUNING SHEARS
These shears work with the same easy but powerful compound action as the pruning hook. They are especially adapted for cutting out water sprouts and suckers, heading back young trees, trimming hedges, berry bushes, etc.

THE BASTAIN "OREGON" FRUIT PICKER
gets the fruit that's "way out of reach" of your hand, and picks it without bruising in the slightest. You need this handy fruit picker. It will soon save enough fruit to pay a big profit.

TRY THE SE ORCHARD TOOLS
Bastian "Oregon" Orchard Tools are carefully made of the best materials. They are reasonable in price and guaranteed. Made in all lengths.

If the local dealer cannot supply you with these tools, do not accept substitutes. Write to us and we'll send prices and the name of the nearest dealer who can supply you, or we'll ship direct. Try Bastian "Oregon" Tools before buying others. Write to-day for descriptive circular.

GREAT CROPS OF
STRAWBERRIES
AND HOW TO GROW THEM

IS the title of a beautifully illustrated book of expert information written in every-day language by America's most successful strawberry grower. It explains how the Kellogg Pedigree plants are grown on the great Kellogg plant farms in Oregon, Idaho and Michigan. It contains pictures of the best varieties of strawberries, including fall-bearing kinds, and gives full descriptions. It tells how to grow big crops of fancy berries, and how to market them at big prices. Explains in detail The Kellogg Way.

OUR FAMILY STRAWBERRY GARDEN
Whether you have a small garden only or a big farm, you should grow your own strawberries. Kellogg's Big Red Strawberry Garden will produce all the delicious strawberries your entire family can eat, summer and winter. You can have shortcake, strawberries and cream, preserves, jam and canned berries, the year 'round for less than one cent per gallon. Our Book gives full information.

Strawberries
yield more dollars per acre and give quicker returns than any other crop. Set one acre to Kellogg's Pedigree plants this year, and put from $500 to $800 in the bank next year. Our Book tells you how. IT IS FREE.

R. M. Kellogg Co., Box 480, THREE RIVERS, MICH.

SMALL FRUITS
Bring Quick Money

There's big and *quick* money in Strawberries and in all Small Fruits. You don't have to wait long years to reap your harvest. We are headquarters for Summer and Fall Bearing Strawberry Plants, Raspberries, Blackberries, Gooseberries, Currants, Grapes, Fruit Trees, Roses, Ornamental Shrubs, Eggs for Hatching, Crates, Baskets, Seed Potatoes, etc. Best varieties at the lowest prices. 30 years' experience. *Our free catalogue contains valuable information. W. F. ALLEN, 72 Market St., SALISBURY, MD.

Winter in the Country.

While Winter is usually a season of joy to children in general it is often a lonely dreary season to women who live upon the farm. Usually the mother can find plenty to do to occupy her time and attention, but weeks and weeks of the same round of duties, with but little change, is very tiresome, making existence in the country a mere treadmill of wearisome tasks which must be done over and over again. An effort should be made to bring variety into the home life of the farm women. Home is always twice as sweet to one when she returns to it after being absent. We often gain contentment from going out among our neighbors and finding out that they, as well as ourselves, have rough places in their own lives. We take up our own burdens more cheerfully when we realize that we are not the only ones who have crosses to bear. We are all so differently situated that it is impossible to make out a social outline for every neighborhood, but in this rather remote New England town we have kept up a very pleasant sociability during the cold season.

At Christmas last year we had a very pleasant neighborhood party, where all were invited, young and old. It was held in a large, roomy farmhouse, decorated with red paper, evergreens and Christmas bells by young girls of the neighborhood. Nearly everyone in the neighborhood came. Whist, checkers and other games were played. Dancing, singing and music were enjoyed also. Refreshments of fruit, candy, cake and cocoa were served. A sum of money had been contributed by different ones for the fruit and candy and all the ladies brought cake, so that no great expense was entailed upon one family. The parents enjoyed themselves as much as did the children; the grandparents also entered into the fun, and the Christmas gathering was one long to be remembered.

In every neighborhood there should be some leading spirit in order for there to be genuine sociability. There must always be a leader in every undertaking great or small. It is usually for the lack of leadership in the country that life is dull and unattractive. The world is full of pleasures right at our own doors if we will but step out and find them. A Ladies' Sewing Circle could be organized which would do a world of good. The ladies in each neighborhood could meet and sew for each other. A great deal of work could be accomplished in an afternoon, and many a weary woman would rejoice in having her friends come in and help her do her work. Then another week they could meet with another neighbor, then still another, and so on until the round of the circle was completed. Or if they did not wish to sew for each other, they could sew for some over-burdened shut-in, taking their own refreshments and making the day one of pleasure and no extra work to the hostess. There are always carpet rags to sew, rugs to braid, garments to be made, mending to do. Always "something to do for somebody else." And in doing for others we enrich our own lives and bring to ourselves as well as to others the best and purest kind of happiness.

In the early days of our country, when New England was striving to regain herself after the Revolution, sociability in neighborhoods was very great. The common hardships which each family had undergone had knit them together in bonds of friendship, so practically all of their work, as far as possible, was done in "bees." Husking, paring, and quilting bees were the order of the day, which brought the people together in the evenings. Newspapers were gaining in circulation, and every town had its newspaper circle. They met at each other's home, exchanged newspapers and read them aloud. To-day, when our homes are supplied with newspapers and magazines, there may not be the need of a newspaper circle, but would it not be of benefit to have the members of the magazine clubs, of which there are many, meet frequently at each other's homes for an evening, instead of simply passing the magazines around to each other as most of them do? It would promote the taste for good literature and would do a great deal towards making country life attractive in Winter.

Why do not you who have leisure do something more than you are doing to brighten the lives of those around you? You would be surprised to find out what you could do, if you would but try. Our country neighborhoods do not need to be the lonely places they so often are, if one or two in each neighborhood would earnestly try to do something for themselves and for their neighbors. This is a good motto for each and all:

"Let me live in my house by the side of the road and be a friend to man."

SUSAN JEWETT HOWE.

White Oilcloth in the Kitchen

It has been our fortune either to build new or make over several different kitchens, and in each one we have found the use of white oilcloth one of the most helpful things about them. We like a bright clean well-lighted kitchen, not too large, with a good outlook on the world; a cozy corner by the kitchen fire where the men folks can rest a bit and pick up their paper. In fact the kitchen is the most cheerful room in the home. We never did like wainscot; it made the room look too barnlike; then too the paint was hard to clean. So we took white oilcloth and put it on the walls, from the baseboard up the full width of the oilcloth; paste it on just like wallpaper. It makes a smooth hard wall that can be wiped off like a china plate. Tile paper is used above that, with sometimes a piece of moulding to finish the edge where the two meet. We paste it on the pantry shelves, and use it on the pantry walls as in the kitchen. The kitchen table and work table is covered with it, with several thicknesses of paper beneath to make it smooth. It is neat, clean, sanitary and inexpensive, for with care it will last for years. In one kitchen we used it six years, and it was as bright at the end of that time as when put on. We have never seen it used in that way. Be careful to have it fit snugly around the window and door frames. It can be put over papered, boarded or plastered walls, with good satisfaction. F. H.

THE SHALLOT.—A recent query came to us relative to shallots, and we found that this little onion is unknown to a good many people. The name is sometimes given in the markets to small onions or scallions, but the true shallot is a different plant, having small clustered bulbs like garlic. Its botanical name is Allium Ascalonicum, its name being derived from Ascalon in Palestine, where it grows abundantly. It has been cultivated from time immemorial in the East, and was doubtless brought by the Crusaders to Europe, being used in Great Britain in the sixteenth century. The shallot is milder in flavor than garlic, and is used quite freely in sauces, catsups and salads.

Mitchell

Mitchell Little Six

Eighty Years of Faithful Service to the American Public

The Mitchell-Lewis Motor Company has the enviable record of *eighty years of faithful service to the American public.* Bear this in mind when you get ready to buy a car, for it operates as *insurance of quality.*

Eighty years of faithful service is an asset *of no uncertain value.* This company held the respect of the early settlers of the western country because of absolutely honest merchandise in the shape of farm wagons. It established its standing before automobiles were known. When it embarked in the automobile business, it clung to the policy that made its farm wagon business famous. And its automobiles are famous, *for the same satisfying reason.*

You've got something behind you when you buy. Our standing and prestige constitute a *bulwark of safety.* Add to this the remarkably fine character of the Mitchell Models and your purchase is *as solid as the Rock of Gibraltar.* Ask any farmer in America what he thinks of the old Mitchell-Lewis Wagon Company. Ask any one of thirty thousand Mitchell automobile owners what he thinks of the Mitchell-Lewis Motor Company. Their reputation and reliability are precisely the same.

The Mitchell Models for 1914:

No. 28 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator, Rake and Plow

The newest and most accurate Planet Jr seeder. Sows all garden seeds in hills or drills, opens the furrow, covers, rolls down, and marks next row all at once. Has steel frame and handles, and complete set of attachments. for woman's use.

Scientific Cultivation

Get away from useless drudgery and old-time wasteful cultivating methods in your family garden and on your farm. Use the Planet Jr and do the work of 3 to 6 men better, quicker, cheaper. Planet Jrs are light, strong, lasting. $2 to $100. Fully guaranteed.

FREE Our new 72-page illustrated catalogue of 60 implements for all farm and garden uses. Write postal *today.*

S L ALLEN & CO
Box 1107V Philadelphia

No. 25 Planet Jr Combined Hill and Drill Seeder, Double Wheel Hoe, Cultivator and Plow

A capital implement for large-scale gardening especially. It has a steel frame, and complete seeding and cultivating attachments. The hoes run close to row without danger to leaves or roots. Two acres a day can be worked with this tool.

Planet Jr.

Light enough

Planet Jr 12-tooth Harrow, Cultivator and Pulverizer

An invaluable tool in the market-garden, truck and strawberry patches. Has new steel wheel which prevents clogging. Its 12 chisel-shaped teeth cut out all weeds, stir and mellow the soil and leave the ground in the finest condition without throwing dirt on plants.

No. 30 Planet Jr Single Wheel Hoe, Cultivator, Plow, Rake and Marker

A new Planet Jr Single Wheel Hoe that is light, strong and practically indestructible—the frame and handles are steel. It is completely equipped for plowing, hoeing, cultivating, and raking. The marking attachment insures rapid, economical wheel-hoeing.

No. 10 Planet Jr Horse Hoe, Cultivator, and Hiller

Does more and better work than any other horse-hoe ever invented. It is light and easily handled, yet unusually strong. Has new steel wheel which prevents clogging with trash. Quickly adjusted to rows up to 3½ feet apart. Vine-turner attachment is great for many crops at last workings.

Hope Farm Notes

This is *nice* weather! How can anyone make good resolutions, with a "stick" in them, when the first Sunday of the new year turns up like this? Instead of snow and ice, last night brought a fierce rain. This morning every little hollow has turned to a puddle. Still the rain comes, and a fierce, cold wind has risen. With church some miles away, our folks gave up the trip. The rain pounds at the windows and the wind shakes the doors, but we are all dry and warm. The cows have stalks and mangels to amuse them, and we have a good supply of books and a warm open fire. On a day like this the average man is likely to sleep, find fault, or raise "a grouch"; or he will read something that can take his mind away from himself. Of course a man is harmless while he is asleep, but the "grouch" is one of the social worms which gnaw the family heart out. The great resource for a day like this is reading. Looking back a good many years now, I can see that one blessed thing that came out of my hard childhood was the fixing of a reading habit. What is there on the surface of this good earth that I could buy with a million dollars which could even equal the satisfaction of sitting before my fire on a day like this, and wandering off into an unseen country with the author of a good book? When I was a boy the old folks made me read such books as "The History of Josephus," or "Transactions of the General Court." Such literature will start no reading habit in a boy. I suppose I ought not to tell it, but my habit was started on stolen fruit. It somehow came to that childish mind that there must be, somewhere, books which carried a message that was not like taking medicine! That kind seemed to go right into the fire if they got inside the house. I went out into the barn, and with a hay-knife cut a tunnel or hole under the hay, with a good-sized space at the end, near a window, which gave light enough for reading. The old gentleman who brought me up was lame, and I was expected to do most of the chores. I got a great reputation for industry in currying the cow and sweeping the barn, when in truth I fear I was curled up in my hole under the hay enjoying stolen fruit. For there I nibbled at "specked" apples, and read such books as I could pick up in the neighborhood. To you that would have seemed like a dusty and dreary prison. To me it was like fairyland. As I read I could forget the wild storm outside; the narrow hole in the hay mow "faded away to marble halls." The author of these books took me right by the hand and led me up to the pleasant places of life. This will be read by gray-haired men, who perhaps were placed as I was years ago. We were made orphans by the Civil War, and "given out" because the home could not carry us all. These men will know how such boys needed the sentiment and thought which came through a reading habit, and what would have happened had it been denied them.

Two books which I read over and over in those days were Dana's "Two Years Before the Mast," and a ragged and thumb-worn "History of Paraguay." To-day, on this cold, wet Sunday, it seems very much like old times to take up "Two Years Before the Mast" and imagine myself back in the old hay-mow once more. It is a surprising thing, but the old book seems just as fascinating now as in those old days half a century back. Here I am reading about the flogging aboard the brig Pilgrim, throwing the hides down the cliff at San Pedro, the fearful struggle to get around Cape Horn, the fight on deck between the big overgrown lad from Cape Cod and the boy from the Boston school. It is no wonder Dr. Eliot has put this among the "classics," to rank with the few great masterpieces which cannot be forgotten or lost. This book takes hold of you. It is so simple and true that you may lie in your hay-mow with mittens and overcoat on, and sail away under California skies with no thought of zero weather. The cow in the basement may not be carded, and the calf may bellow for her hay, but you are off in the future where great things are to be done.

Dana took his voyage in 1834. At that time California was considered a part of Mexico, and little was known about it in the Atlantic States. When gold was discovered in Upper California, "Two Years Before the Mast" was practically the only book which gave true information about the Pacific Coast. While Dana gave the actual facts—true pen pictures of what he saw—we must smile now to read his reasoning from these facts. This is what he said of California in 1835!

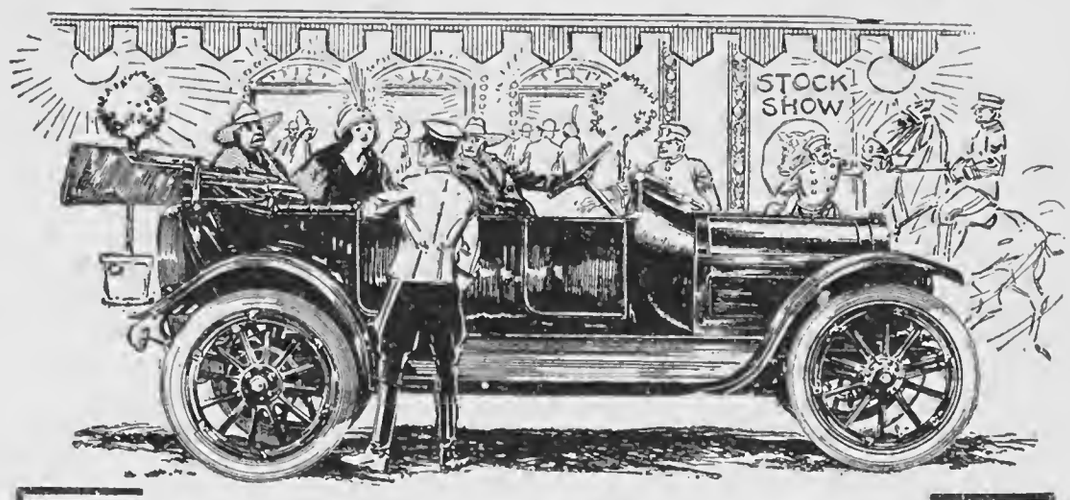
"In the hands of an enterprising people, what a country this might be, we are ready to say. Yet how long would a people remain so in such a country? The Americans (as those from the United States are called) and Englishmen, who are fast filling up the principal towns, and getting the trade into their hands, are indeed more industrious and effective than the Spaniards; yet their children are brought up Spaniards in every respect; and if the 'California fever' (laziness) spares the first generation, it always attacks the second."

Nearly 80 years ago that seemed accurate reasoning from the facts, yet how time has disproved it all. Dana could not foresee that the gold discoveries would mean to California, and he did not realize the full, enduring power of the white race under the spur of labor and necessity. Had California become a slave State Dana's estimate would have been nearer right, for there can be no permanent progress or stability of government except where the great middle class of people labor willingly and with fair profit.

What comes to me to-day on this wet and dismal January Sunday is that neither Dana on the California coast nor the boy in the New England hay-mow could reason accurately from the facts then at hand. Suppose Dana in his day could have read Smith's "Conquest of Arid America," or suppose the boy could have read with understanding such a book as "The Promised Land." One book tells what is to happen to the Far West when intelligent white men turn water upon the desert sand. The other gives a vision of the effect upon New England of the swarms which are to come from Europe to do the labor which "Americans" grow away from. Both Dana and this boy would have been far better off and would have made broader and more capable men could they have worked away from the shell of that old prejudice which prompts men to conclude that whatever is hard or out of the ordinary comprehension must be impossible. Eighty years ago Dana, the highest authority, could see little if any future for California. Look at the State now! Who can read such books and not ask himself: "If this be true, what is to happen 80 years from now?" It is a large thought, and some of you may say, "What is that to me?" Your children and their children, your property and your plans, your life work, are all to be tested in that far-off time. The rain that is beating against my window may be evaporated and condensed one thousand times over before that time, or it may work through one hundred different bodies. You cannot affect that, but the man who watches it from his fire 80 years hence may be a little short of what he ought to be if you sit and let your mind stagnate, or laze in sleep, or a "grouch" when a strong book would gladly take you in hand.

I do not even know who wrote that "History of Paraguay," but it told of the war with Brazil. The tyrant Lopez commanded, and for years the people fought on until over 60 per cent. of the men were killed. In the last battle white-haired men, women and boys of 10 fought side by side against the Brazilians. As a boy, in my hole in the hay, I used to drop the book and wonder why these people could fight like that. Lopez was a brutal tyrant. He had robbed and degraded his country. There was no hope under his rule, yet what frightful miseries these poor people endured fighting for their native land! That is one country I have always wanted to see, in order that I might learn what there is about it than can arouse such patriotism. Now comes Joe Wing's book, "In Many Lands," which gives the best idea of the South American people I have yet seen. Joe Wing went to Patagonia and Argentina for a study of the sheep and wool industry, and this book is written as simply as "Two Years Before the Mast." It is full of pen pictures which might well take a man away from a stormy Sunday. Imagine a little seaport without protection on the lower Pacific. A few straggling houses with iron roofs stand in the fierce and perpetual wind. A broad highway, fenced on either side, runs from the ocean straight back hundreds of miles away to the mountains. Down this highway toiling oxen haul great loads of wool, and great flocks of sheep come walking out of the dim, mysterious interior to the slaughterhouses. What have we to do with such a hateful place? I can remember when James G. Blaine was Secretary of State, and the speech he made to the delegates from South America. His prophecy of close trade relation with the country south of us has not yet come true, but it has only been delayed. Our children are to find in these Southern Republics a most wonderful opportunity for trade and development. To reason only from the facts of the present would be as futile as Dana's statement about California 80 years ago. I regard Joe Wing's book as one of the most useful volumes that this century has given us thus far. I saw Mr. Wing a short time ago, and told him of that old "History of Paraguay." Then I asked him how he accounted for the fact that these people endured such fearful privations for a brutal dictator like Lopez. But here we are at the end of our space, with dinner ready, too. We must let this go awhile.

H. W. C.



The Climax of 21 Years of Motor Car Building Experience Is the Appersons' Master Creation — the New "45"

"The Wizard of the Hills"

WITH their own hands, 21 years ago, Elmer and Edgar Apperson built America's first automobile. They have been building them ever since, and in all that time no Apperson car has ever worn out. Annual upkeep, our parts-purchase record shows, is but $5 per car. Consider that some of these are 20 year old cars. The Apperson Brothers have never created a failure. They have never built a car that developed chronic trouble. They are the only makers who hold such a record. Their company, organized 21 years ago, is the oldest in the automobile industry. In 1903 they achieved chassis perfection. Judge the wonderful car that must come from that wealth of experience. For it is greater than that of any other maker.

And now the Apperson Brothers announce their masterpiece—the greatest of all Appersons—the new "45." In it is crystallized the vast knowledge these pioneers secured in twenty-one years. It is equipped with every comfort and convenience the motorist desires in an advanced automobile.

Ten years ago we reached that point in automobile construction, toward which other manufacturers have ever since been striving—BIG POWER—LIGHT WEIGHT—LOW-UP-KEEP COST.

Five-Hundred-Year-Old Pastures

Yield Rich and Abundant Crops of Clover when Fertilized with

Genuine Thomas Phosphate Powder

(Basic Slag Meal)

Key-Tree Brand

FAILING PASTURES are fast becoming a serious problem.

For years animals that have fed upon these pastures have carried away plant food from the land; Nitrogen in the forms of milk, flesh and wool; Phosphoric Acid in enormous quantities in the bones. Cattle bones, as a matter of fact, are fifty per cent bone phosphate of lime. Consequently, old pastures are found to be especially deficient in phosphoric acid, and of a generally infertile character.

The use of nitrogenous fertilizers is rarely profitable upon pasture lands, but by the application of GENUINE THOMAS PHOSPHATE POWDER, Key-Tree Brand, (which furnishes Phosphoric Acid, Lime, Magnesia and Iron,) the character of the herbage may be completely changed.

In place of the tough wild grasses, sorrel and weeds, there comes in a rich growth of clovers and highly palatable grasses, which transform the barren fields into luxurious feeding grounds.

After trials of various fertilizers on pastures for fourteen years, Professor William Somerville says: "Basic Slag applied as a single dressing at the rate of half a ton per acre has generally proved a most effective agent in improving the feeding value of pasture and its benefits are not nearly exhausted at the end of nine years."

Clovers will take their nitrogen from the air; but clovers must have Phosphoric Acid and Lime in abundance. ***Genuine Thomas Phosphate Powder, Key-Tree Brand,*** furnishes 17 to 19 per cent Phosphoric Acid and 35 to 50 per cent of Lime.

More cattle on our pastures will help to solve the problem of the high cost of living.

The whole story is told in our new booklet, "FIVE-HUNDRED-YEAR-OLD PASTURES." Is it not worth your while to study this carefully with a view to reducing your grain bills from one-third to one-half? A copy is yours for the asking.

The Coe-Mortimer Company

51 CHAMBERS STREET, NEW YORK CITY

POWER SPRAYER for Large Orchards

Power and capacity. 150 to 250 gallon machines, 200 lbs. pressure with 6 to 8 nozzles, 2 H. four cycle, air or water cooled engine, gear driven double acting pump, hemp packing, ball valves, sediment chamber, all easy to get at. One of 70

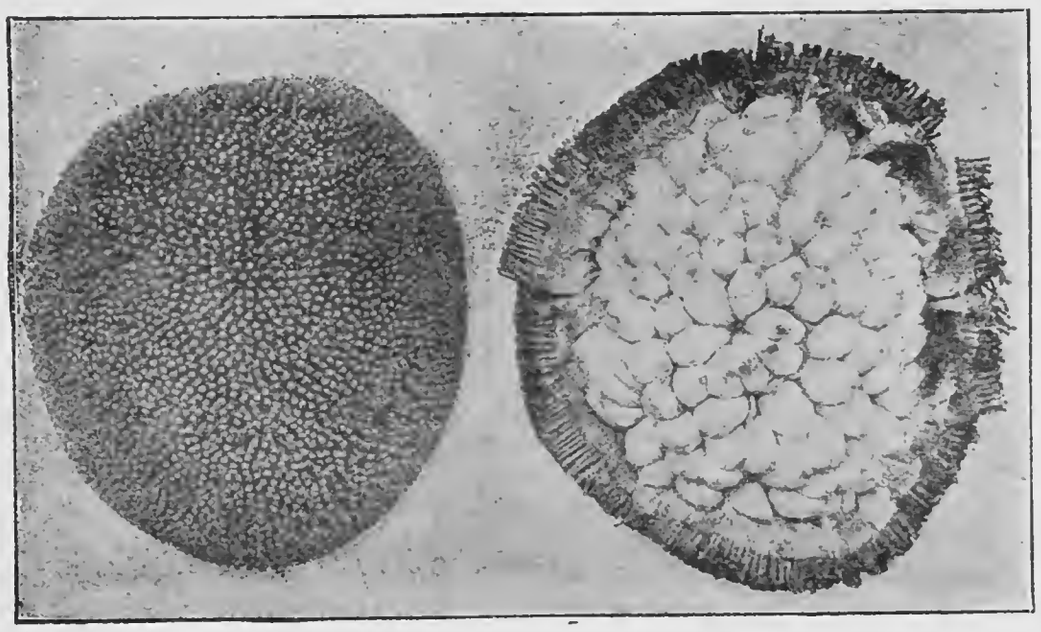
A PHILIPPINE BREAD FRUIT.

The Office of Foreign Seed and Plant Introduction, in Circular No. 89, gives the interesting picture of Artocarpus odoratissimus shown in cut below. This plant is known as the marang, and Mr. P. J. Wester, in charge of Lamao Experiment Station, who collected seeds of this plant, says:

"These seeds were collected in Zamboanga during my recent trip to Mindanao. This is my second opportunity to test the marang, and I have no hesitation to declare it as one of the coming tropical fruits even in its present undeveloped state. It is very sweet and rich in flavor, and has the unique quality of having a flesh that separates readily and absolutely from the seeds and the skin. As far as I have been able to ascertain, the marang occurs only on the south coast of Mindanao and in the Sulu archipelago. On my return to Manila I met on the steamer a missionary who had lived in Borneo for three years, part of which time was spent in Sandakan. She had neither heard of nor seen the fruit before. The marang will probably not succeed except where the climate is warm and humid throughout the year and the atmosphere close and still. The tree is also known as madang. It is a medium-sized tree with large dark-green leaves, entire or more or less conspicuously trilobate, 18 to 24 inches long and 10 to 12 inches broad, similar in habit to the breadfruit, and is found on the south coast of Mindanao and in the Sulu archipelago, and was first described from Mindoro. The fruit is large, about six inches long and five inches in equatorial diameter, roundish oblong, regular, thickly studded with soft greenish-yellow spines about one-third of an inch in length on the outside; rind thick and fleshy; flesh white, sweet, rich, juicy, aromatic and of good flavor, separated into segments (of about the size of a grape) clinging to the core; each segment containing a seed; seeds many, whitish, one-third by three-fifths of an inch, smooth, separating readily from the flesh. When the fruit is ripe, by passing a knife around and through the rind, with a little care the two halves separate from the flesh, leaving this like a bunch of white grapes. Ripe fruits were obtained in August. The marang is far superior to its relatives, the jak and the ordinary breadfruits found in the Philippines."

The ordinary breadfruit, Artocarpus incisa, and the jak or jack-fruit, A. integrifolia, furnish a staple food in the Pacific islands, and are also grown freely in the West Indies, and in all countries favorable to their growth. The breadfruit was first brought into notice in Europe through the voyages of Captain Cook, and in 1787 the British Government sent the ship Bounty, under the command of Captain Bligh, to Otaheite, to secure a cargo of young trees for naturalization in the West Indies. The historic mutiny of the Bounty and the perils of Captain Bligh, who, with a few companions, was set adrift 3,618 miles from help, are well known. He made a second journey on the same mission in the ship Providence, and in 1793 breadfruit trees were flourishing in Jamaica, and with the cocoanut and banana, comprise the chief food of many tropical countries.



THE MARANG—A PHILIPPINE BREADFRUIT.

CHINESE WINTER CABBAGE.

Among new plants referred to in Bulletin 89, of the Office of Foreign Seed and Plant Introduction, is a large variety of Chinese Winter cabbage, coming from near Tientsin, called "Ta pai tsai." Chinese Winter cabbage is a vegetable of first-class quality, having a rich flavor all its own. It is very much easier digested than the ordinary cabbage and emits no offensive odors when boiled. It can be served in many different ways, and may be eaten boiled or stewed, raw, pickled or salted. To obtain the best results a rich, well-worked soil is needed; the plants must have a space of about two feet in all directions, and they must be regularly cultivated, and they must never suffer for lack of sufficient soil moisture. The best time for sowing the seed is about the end of July or early in August; for regions with a very long Summer even later will suffice. To keep them during the Winter the Chinese proceed this way: After the first heavy night frost the cabbages are pulled out by a twist of the hand, the earth roughly shaken off the roots and the plants left lying on the field for a day or so to dry them off; then the outer leaves are pulled off, the dry soil beaten from the roots and the cabbages brought to dry dug-out cellars, where they are neatly stored layer on layer with the heads facing the entrance. Dry straw is now put over them and the whole covered with a heavy coat of soil. When stored carefully they last until late next Spring. The roots must never be cut off, as otherwise the plants begin to rot. When grown for seed the roots with just an inch or so of the leaf-stumps left on them are planted out in the Spring on a special piece of land, where the soil is not too heavy. They soon form new rootlets, and in a short time stalks rise up with but very scanty foliage and bearing pale yellow flowers. The process of setting seeds takes but little time. When all goes well one has fresh seeds again in early or middle July. From the climate of North China it is believed this cabbage will do well where the days are warm but the night dry and cool.

Famous Deming Nozzles

Garden and Orchard PAY BETTER If Properly Cared For! To take care of them means to spray. Spraying stands for bigger and better crops that bring higher prices.

Deming Spray Pumps

will help you to do more of better spraying in less time. We make more than 20 kinds—a sprayer for every purpose. All are dependable and all do thorough work. For best results adopt the ideal combination—Deming Sprayers and Deming Nozzles. Most dealers sell both.

Spraying Guide FREE

Tells when and how to spray. Catalog describes our complete line of sprayers. Ask for it on a postcard Today.

More than 100,000 Farmers and Fruit Growers Use the STANDARD SPRAY PUMP

With it they spray their tallest orchard trees *from the ground* in half the time required by others. The knapsack attachment enables them to spray their potatoes and low growing crops at the rate of an acre an hour or better. They whitewash their barns and chicken coops and spray "dip" on their live stock with the Standard Spray Pump.

Made throughout of brass, with nothing to wear out or break, the Standard Spray Pump lasts a lifetime and pays for itself over and over again.

Warranted 5 Years. Price $4 Prepaid. (West of Denver $5.) Money back if not satisfied.

Send no money but write today for our Special Offer and Catalog M.

The Standard Stamping Co. 948 Main St., Marysville, O.

HURST SPRAYERS ON FREE TRIAL

NO MONEY IN ADVANCE—NO BANK DEPOSIT—PAY AFTER IT HAS PAID FOR ITSELF.

LET US SEND YOU ANY OF THESE SPRAYERS—to try for 10 days, then if you buy, you can pay us cash or we'll wait till next fall for our money.—The extra profit will more than pay for it. We pay freight. LOWEST PRICES. HIGHEST QUALITY. 5 YEAR GUARANTEE.

Quality Sprayers for every purpose. Man Power and Horse Power for field and orchards. Barrel and Power Sprayers all give high pressure and produce vapor spray that kills scale, prevents blight and scab, and rids your crops of all fungus and insect pests. Hurst Sprayers have brass ball valves and all the working parts that come in contact with the solution are made of brass. Cyclone agitation insures an even distribution of the spraying materials and best results. These sprayers are made by practical men who know the needs of the fruit grower and farmer and know what a sprayer should do. Our 27 years' experience in the manufacture of sprayers, together with the capacity of our large factory, enable us to build the very best sprayers at the very lowest prices. We guarantee our sprayers for five full years and ship on free trial—no money in advance. That's evidence of quality. Get our big **FREE BOOK**—"Why, How and When To Spray"—Contains 74 illustrations of insect and fungus pests and gives remedy for each. Also shows 23 different styles of quality sprayers for every purpose. Write At Once

FREE You can get a Hurst Sprayer absolutely free if you are the first in your locality this season to send for one of our sprayers for trial. You need do no canvassing or soliciting. It will only take 15 minutes of your time. We do the work. When you get a sprayer from us you get the benefit of our 27 years' experience in manufacturing sprayers. Hurst Sprayers won the gold medal at the National Horticultural Congress spraying machine contest. Send us a postal or mark the attached conpon and mail it to us and we will send you our fine catalog, spraying guide, and will tell you how you can get a sprayer free. Don't delay, write us at once for our free sprayer proposition and save money.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

Come all ye agriculturists
And listen unto me.
You want to study up in A,
But practice down in Z.
For up upon the heights of A
Pure science may be found,
But in the valley down in Z
Men practice on the ground.
Fill up your mind, fill up your heart,
With all that A can give,
And then translate it down to Z
Where common people live.
Some men go climbing up to A,
And drink from wisdom's cup.
And then forget their solemn vow
To help their brother up.
And others from the springs at A,
Take wisdom in their hand,
And o'er the lowly vale of Z
Translate it through the land.
They sow the patient seed of thought,
The germs of truth they cast
Into the dust of prejudice
And dead soil of the past.
Yes, those who tarry up at A
Will have a pleasant time,
But those who labor back in Z
Can make their lives sublime.

*

CAN you tell us anything definite about the use of gasoline or kerosene engines for plowing or cultivating? A number of such machines have been tried, but it is not always easy to obtain fair, unprejudiced truth about the work they do. It is evident that in some situations the gasoline horse is a success. What soil or slope or surface does he need to make him profitable? Now will those of our readers who have given these tractors a fair trial tell us just what they have found out?

*

CONSIDERABLE trouble from leaf-curl on peach trees is reported from New Jersey. It seems to be due to the fact that growers failed to spray with lime sulphate before the leaf buds made some growth. This gave the fungus a chance to take hold inside of the leaves. Then of course it was impossible for the spray to reach the disease germs and destroy them. There will be much more of this trouble during the coming season, and thorough early spraying must be done to fight off the disease.

*

WE have already mentioned Farmers' Week at Cornell, February 10-15. This gathering has come to be a great Winter event for New York farmers. The programme this season is better and more varied than ever, and there will be a hearty and eager crowd of farmers and their friends. Even if you do not attend a single lecture you will be more than repaid by mingling with this great company, hunting old friends and making new ones. You not only benefit yourself, but you will help farming generally by helping to make a great company for agricultural education.

*

DURING the year we have at least 500 cases where trouble has arisen over a loose contract, or where some verbal agreement has been made. Two parties agree to do certain things, or one lends another money on a verbal promise to pay. After a time business does not turn out as one party expected, and he repudiates the contract, or claims that it has a different meaning from what the other asserts. Then they find that the contract is not binding any way. One man lends money to another without any note or obligation, and finds that he cannot collect it. Our advice invariably is to have contracts drawn up by a lawyer, or by some first-class business man who knows how to do it. There is no other safe way. As for lending money without notes or obligation, Ex-President Taft, who is now teaching law at Yale, is credited with this story. A lent money to B, but took no written note to prove it. B repudiated the debt and claimed it was a gift. At the trial A swore he lent the money, but had no witness to support him and no written statement, so he lost his case. Shortly afterward A saw B on the street and rushed up to him saying there were four witnesses to prove B took the money. "Who are they?" said B. "Me and God and you and the devil." This was true, and yet, even with this formidable list of witnesses, A could not prove his case before a human jury. A drop of ink well distributed at the point of a pen would have saved this money.

*

"If anyone thinks he can tell me how to grow better crops, I am willing to listen to him," said one farmer. "If his plan appeals to my judgment, I will give it a good trial on my farm. If anyone has a new way of doing something that is better than my old way, I want to find out about it."

That report comes from Kansas where, it is said gray-bearded men are taking a short course at the agricultural college. What is the matter with that sentiment? Here is a man who has run a farm so as to make more than a living. Who has now a better right to use his judgment in deciding whether agricultural science is sensible? If the agricultural teacher cannot appeal to that man's judgment, which needs training, the judgment or the teacher?

*

SOME of our people are a little troubled over the future market for hay. They are ready to seed down more and more of the farm, but the hay buyers predict low prices and stagnation. It is the old argument—gasoline power taking the place of horses. We might take more stock in this argument if we had not heard it continually for 20 years. We knew this city when every street car was hauled by horses, and the application of gasoline power to motors was unheard of. Now there are hardly 100 street car horses left, and motor trucks are everywhere. Yet prices for both good horses and good hay are higher than ever, and are likely to continue so for 10 years. We must remember that the introduction of "certified milk" has started great dairies on high-priced land near the big cities. The hay for feeding these cows is mostly purchased, and this demand will greatly increase in the future.

*

THERE was a struggle at Albany over amendments to the rules in the Assembly. The progressive element in all the parties wanted to cut down the autocratic power of the Speaker. This power has been usually exercised through committees. An effort was made to take the power of appointing committees away from the Speaker and give the Assembly the right to elect the chairmen at least. This suggestion was defeated, but several reforms were made. We can know hereafter just how the members of committees vote. The committee must meet regularly and we are on the way to the point where a reasonable number of Assemblymen can compel a committee to act and where the so-called committee on rules cannot use arbitrary power to hold up needed bills or advance personal measures. Such reforms would have been impossible 10 years ago. The "folks back home" have found the way to Albany.

*

WILLIAM Waldorf Astor was born in this country, and with the rest of his family has profited greatly by the rise in American real estate without giving any particular labor in return. Mr. Astor gave up his American citizenship and became an English subject. No one can reasonably find fault with this, for thousands of Englishmen have become Americans, and if any man is not satisfied with this country both are benefited by his leaving it. Mr. Astor's young son has been in this country for a short visit and as he started back, he was "interviewed."

"What of the things you've seen in America do you like best, Bill?" said an interviewer.

"An apple. Do you want to see it?" Bill disappeared into the stateroom and returned with a big rosy apple in his hands. "They don't grow like that where I live," he commented.

It was probably a Winesap or a Baldwin. This young man seems to have taken something straight from his old ancestor, John Jacob Astor, who had such remarkable ability at seeing values and selecting almost by instinct the important things of life. A century ago John Jacob would have said furs when asked such a question. "Bill" sees in the big red apple the one desirable thing of life. It seems to us that there is great hope for "Bill."

THE meeting of the New York State Fruit Growers' Association at Rochester was a great success as usual. When this society branched off from the old Western New York Society there were many who felt that there could not be room for the two. The business of fruit growing and selling has developed so wonderfully that these predictions have been disproved. Both societies call out crowds of fruit growers and vast displays of fruit and fruit growing appliances which were undreamed of when the younger society started. These meetings cover such a vast range that it is quite impossible to give an adequate report of the proceedings. Of late years, with greater attention given to the mechanical or business side of the industry, the speaking programme is no longer the most important feature. The best part is the unreportable visiting and conversation which goes on when fruit growers come together for conference. As evidence of the way those meetings are changing the banquet was given up this year and a "popular entertainment" substituted.

*

No use talking, this poultry business is developing so fast that you can hardly keep track of it. On page 97 we are told about "Miracle Mary." This Leghorn hen was too busy laying eggs to put on fancy points. So the poultry judge turned up his nose and said "everything" was the matter with her. Then comes Mr. Proctor in his excellent article. It seems that the American Poultry Association has finally got down near the ground, and will start a "utility" score. Now follows Prof. Dryden with his remarks on that world's champion hen. This hen is a mixture of Rock and Leghorn blood, and Prof. Dryden puts up an argument for trap-nesting the breeding stock. We felt sure that just this form of discussion would follow the egg-laying contests. These contests give the facts upon which to base definite experiments, both in breeding and feeding for egg production. There is no end to the things which these contests suggest. One is the cold storage proposition. Then comes Peter Radford of Texas, with some large statements:

> We market 65 per cent. of our egg crop in April, May and June, although the consumption of eggs runs very nearly even throughout the entire year. The American farmer to-day is paying the middleman the princely sum of $238,600,000 per annum for storing and selling his eggs. This sum of money would build and equip sufficient storage to care for the agricultural production of the nation. The value of the nation's egg production during a decade is equivalent in value to all the farm property in Texas; would build a city the size of St. Louis and would pay the national debt of Spain, Japan and the United States combined.

These figures may be correct—we do not know. They are large enough anyway, but the poultry contests have matched the warm American hen against the cold storage. A. M. Pollard, who has charge of the latest contest, has another guess:

> Cold storage of eggs sprang into existence through the failure of the American to so adjust nature to his needs, that the egg demand could be supplied at all seasons, and cold storage is a blessing if rightly employed, but the destructive features of its employment, so far as price fixing goes, can be quickly overcome by adjusting the flock yield of egg farms.

His scheme is to breed from selected hens who are known to lay during the Fall, and to hatch so they will start early. It has been found that certain hens do make a business of Winter laying, while others lay later. This means keeping the "Business Hen" busy. It keeps her out of mischief, and the cold storage man as well.

BREVITIES.

A FARM planned in January is half cultivated.

WE know men who think they are "some pumpkins," when in reality they are mostly punk.

YOU will probably find feather pulling confined to a few hens in the flock. If you can catch them at it—better kill them.

OUR young apple and peach trees began to wake up during the warm Fall. The wood is too tender for comfortable Winter reflections.

IT is reported that 70 farmers and their sons are taking the short course in steam and gas engines at the Kansas Agricultural College.

It is said to be a fact that some of the sanitary back-to-the-landers actually use talking machines in the cow barn during milking to soothe the cows.

WE think that Winter pruning should be delayed until early Spring this year in particular. The wood is soft and tender, and quite likely to kill back after pruning. In such cases double pruning would be necessary.

THE dog shown at Fig. 12 last week is a brindle bull terrier guarding the chicken house at Fithian Farm, New Jersey. He has the run of the yards at night and is about as friendly to a chicken thief as a shotgun.

A YEAR ago large stories were told about the profits of fox farming in the Yukon Territory. Now the boom seems to have flattened out. Disease has swept off the captive foxes. One young black fox, costing $1,600, died five days after putting him in the pen. At this rate the Hope Farm man's scrub hens were more profitable.

WOMAN AND HOME

MY MOST USEFUL MEAL

By DR. HARVEY W. WILEY

I have been interested in the great problem of dining for nearly three score and ten years. Of my earliest experiences I have little memory. I have been told that I was one of those rare, living unfortunates foreordained to be brought up on the bottle. This doubtless explains my deep sympathy today for the infant for any cause separated from its mother's breast. When asked to give an account of the dinner that lingers most sharply limned in my memory—two stood up like mountains on the vast plane of momentous meals. I shall endeavor to tell you about the first one. The event now describing occurred at the very beginning of my struggle for existence. Its character was almost prophetic of the never-ceasing battle of my life.

Bearing a diploma from Hanover College, which told in Latin, as I thought to a waiting world, that I had been admitted to all the rights and privileges, as well as the obligations, of the Academy of Letters, I received from my father his "Good-bye, Harvey, take care of yourself" and enough paper money (specie payments had not been resumed at that time) to pay my fare to Crown Point, Indiana, just as far from my home in Jefferson County as I could get without going to Chicago. I had been told of the possibility of becoming a teacher in that new but wide-awake town. On reaching my destination my fortune consisted of a diploma, a perfectly dawn-like vision of the future, and a 50-cent shinplaster. All of this property was useful in a way, but it wasn't, with the exception of the paper scrip, a very elastic asset capable of being converted into kale.

I went directly to the office of the county superintendent, and there met the first of the almost innumerable reverses that have littered the path of my life. The teacher had already been appointed—No, at that time there were no vacancies in the county—Yes, there might be one before the snow flies. The superintendent, Mr. Cheshire, seemed to intuitively or by use of the then undiscovered X-ray, audit the contents of my pocket. He invited me home to dine (this is not *the* dinner, however). He found I could speak a little German. He was a candidate for county clerk, at that time a most remunerative office. There was a township in the county almost solidly German. Would I go with him at his expense for a few days to canvass the farmers? I should worry. I spent a whole week improving my German. We visited every farmer in the township. I learned afterwards he carried it almost unanimously. He said he felt certain that before a month passed he could get me a school. Uncle William Maxwell, my mother's brother, lived in Newton County, directly south of Lake County, of which Crown Point was the capital. Yes, I would go there and wait for a letter from him at Brook, a post office not then famous as now, where George Ade gets his mail.

But between me and my uncle's farm flowed the sluggish Kankakee, dammed by the natural limestone ledge at Momence, Illinois. An impassable marsh from 20 to 40 miles wide forbade any direct transit. Twenty miles to the east there was a poorly-marked trail, which, if it could be followed, would lead to a spot where the Kankakee could be forded or swam (swimmed or swum). I decided to undertake the journey. It wasn't very far as the crow (or buzzard) flies, but it was at least 50 miles, of which half was through an almost trackless marsh across which the youthful seeker after a job would have to walk.

After a good breakfast with Mr. Cheshire I started on the journey. It was a warm, hazy, lazy day, in late September. Already the early prairie fires were filling the air with smoke and making a dim glory of the autumnal sunsets. With my 50 cents I bought a ticket to the nearest station in the neighborhood of the trail. With my stomach full of breakfast and my heart full of hope I set forth. In one respect, at least, I was like St. Peter, for I could truly say —"Silver and gold have I none." Nor did I have any scrip in my purse.

The path on the north side of the river was well marked, and before sunset I had reached and forded the Kankakee, uplifting my little belongings to keep them dry, and felt that the worst of the journey was over. Yes, I was a bit hungry as the night came on. The morning had been so warm I had not thought of bring- a match. In Northern Indiana the late September nights are as full of chill as its noons are of balm. Before dark I chose a spot on a sand hill, where a scrub oak was growing, as a bed. But with thin clothing, moistened by the labors of the day and chilled by the frosts of the night, and without an overcoat, for I had never owned one then, sleep was coy. In vain I tried to forget cold and hunger in the fairyland of dreams. I spent much of the night walking around that tree. I can see yet the path trodden deep in the sand, made by my peripatetic vigils. With the earliest dawn I continued my journey.

But the marsh south of the river I found quite a different proposition from its neighbor on the north, there was no vestige of a path. Evidently neither white man nor red had ever set foot in this difficult region. The marsh consisted of a series of level, grassy and miry stretches, into which I would sink often up to my knees, separated by sand knolls in which the walking was almost as slavish. Fortunately I didn't weigh 240 pounds in those days—otherwise I might have entirely disappeared in the grassy mud of the marsh. Fortunately, also, my feet were as big then as they are now—which proved my salvation, for they only had to hold up 130 pounds. In spite of my light weight and the absence of impedimenta, my progress was exceedingly slow. The sky was clear and I had no difficulty in keeping to the south. With no reserve of fat I was proving a sad failure as an autophage.

At high noon I was sure I had not covered five miles—and O, how tired and weak from hunger! I realized, however, that I never would get any credit, nor the thanks of Congress, for dying in the Kankakee marsh, and so I pushed on. After a while I found the mud was not so deep nor the sand so runny, and took courage. But as the sun neared the horizon and no sight of the solid prairie gladdened my eye, and no vestige of human habitations stimulated my hope, I found myself facing the probability of another night of "ring around the rosy" with a jack oak as the central beauty. Not an inspiring thought in view of the advanced state of my accelerated katabolism! As the sun touched the horizon in the hazy west, hope died away and the grim menace of chilled starvation and sore and stiffened muscles stared me in the face. In spite of my fondness for a pun, I was not consoled by the thought that the reason the Children of Israel didn't starve in the wilderness, in spite of the fact that there was no manna, was because they lived on the "sandwhichis there." I hadn't the grit to eat it.

I was preparing to select my siliceous couch for the second night of chilled vigil, when a distant sound caught my ear, a low clicking sound which might have been (except for the continuity) the warning signal of a rattler. Could my ears deceive me? No, it is the click of a mower. In an instant the stupor of fatigue left. A glass of the delicious and refreshing beverage of far-away Atlanta could not have accomplished a greater miracle. With strides which Hiawatha with his magic moccasins might have envied, I subdued the unwilling distance and saw—Yes, a live driver, a team of horses, a real mowing machine —in fact, a life-saver. In about one thousandth of the time which you, dear reader, have given to this simple narrative, I told my story of want and wandering. He unhooked his horses (it was already time to stop gathering the wild, moist grass); he invited me to a seat in his wagon. He was five miles from home. O, those long weary miles! O, those contented horses, seemingly unaware of the flood of expectant pepsin washing the yearning coverings of an empty stomach!

And the dinner? Corn pone and home-cured bacon, potatoes, milk and butter! I felt that I might well employ the rest of my life in singing peons to the pone. The bacon would have inspired a thousand Shakespeares. The milk and butter were (soon) out of sight. And then and there a fitting tribute to the 8,000 consumed calories out of a total of not more than 9,000 available was elegantly paid. Nor Heliogabalus, nor Gargantua, nor Lucullus, ever sat (or reclined) at a feast like that!

L'envoi—My benefactor kept me overnight and sent me on my way bearing a bounteous breakfast. That night I reached Rensselaer, the capital of Jasper County, where I spent the night with an old college chum. The third day I set out to the West, and before nightfall I had reached the farm, near Brook of great fame, of my maternal uncle, farmer and physician, who gave me asylum and set me to work for a small wage on the farm.

In about a month the expected letter from Mr. Cheshire came. I had my first real job, teacher in the public school of Lowell, Lake County, situated on the northern border of the Kankakee marsh. I was launched.

N. B.—I did not walk back to Lowell —I had earned enough money husking corn to buy a railway ticket for the 75 miles of travel necessary to flank the marsh.

"When We Were a Couple of Kids."

"School Days, School Days, Dear Old Golden Rule Days."

POSSIBILITIES OF THE FARM.

I feel that the great need to-day of women on a farm is to look our methods squarely in the face and see if we are not using about the same methods of doing work our grandmothers did. The average woman takes thousands of useless steps every day, and in most households conditions could be remedied at home with comparatively little expense. How many places of business are conducted in such crude ways as the ordinary farmhouse kitchens are? They say the big packing houses have utilized every part of the pig but the squeal. In a great many farmhouses it's all squeal. Father squeals "cause farmin' don't pay." Mother squeals because the life is all drudgery, and all the children do likewise because father and mother do. The fact is they might all do better if they would only look about and see the many fine opportunities a farmer's family has to earn money, to better their condition, without leaving home. Every farm woman should have her own pocketbook. When the young farmer and wife start out they usually are a little shy on worldly goods, and fondly imagine one pocketbook will do. Later there are children to provide for, new machinery to buy, old Dobbin dies and has to be replaced, lightning strikes a cow which must be replaced, or the line fence has to be rebuilt, so the mother's hands are tied with work and care; and she fails to get the things she needs, for interest, rent and taxes must be paid. Suppose she cuts out the needless part of housework and takes up some outside work, such as raising any of the different kinds of poultry, or taking orders for nursery firms. There is money in this, and it may be done at home with telephone. Putting up garden vegetables for city trade is one of the things she may do at home. Each year would then find some new convenienee added to the home, which in time would be a place all would be proud of.

When a family all put their shoulder to the wheel it is bound to turn. It is the grandest place in the world to live if we would only do all we could to make a real home, and not simply a place to stay, until we have a chance to get away. Our little boy, 11 years old, is very proud of the fact that he has a bank book of his own with $100 to his credit at our local bank. He has made most of this with his father's help. This year he has taken care of the pigs, one of which his father bought for him in early Spring. This will bring him nearly $20, sold direct to consumer. He is enthusiastic over his work, and has had experience that will be worth many times the money received for his pig.

As for myself, I love the farm, and all the things on it. I often help my husband milk, and he is ever ready to wipe the dishes or turn a hand at any household work. One of the things I appreciate is a swift little driving horse and a buggy that doesn't rattle. The only person who could induce me to leave the farm would be the undertaker and I hope his day is far away in the shadowy future.

MRS. JAMES LAMPMAN.

Woman and the Home

From Day to Day

DAN'S WIFE.

Up in early morning light,
Sweeping, dusting, "setting right,"
Oiling all the household springs,
Sewing buttons, tying strings,
Telling Bridget what to do,
Mending rips in Johnny's shoe,
Running up and down the stair,
Tying baby in her chair,
Cutting meat and spreading bread,
Dishing out so much per head,
Eating as she can by chance,
Giving husband kindly glance;
Toiling, working, busy life—
Smart woman,
Dan's wife.

Dan comes home at fall of night,
Home so cheerful, neat, and bright;
Children meet him at the door,
Pull him in and look him o'er;
Wife asks how the work has gone,
"Busy times with us at home!"
Supper done, Dan reads with ease—
Happy Dan, but one to please!
Children must be put to bed—
All the little prayers are said;
Little shoes are placed in rows,
Bedclothes tucked o'er little toes;
Busy, noisy, wearing life—
Tired woman,
Dan's wife.

Dan reads on and falls asleep—
See the woman softly creep;
Baby rests at last, poor dear,
Not a word her heart to cheer;
Mending basket full to top,
Stockings, shirt and little frock;
Tired eyes and weary brain,
Side with darting, ugly pain;
"Never mind, 't will pass away,"
She must work, but never play;
Closed piano, unused books,
Done the walls to easy nooks,
Brightness faded out of life—
Saddened woman,
Dan's wife.

Upstairs, tossing to and fro,
Fever holds the woman low;
Children wander free to play
When and where they will to-day;
Bridget loiters—dinner's cold,
Dan looks anxious, cross, and old;
Household screws are out of place,
Lacking one dear, patient face;
Steady hands, so weak but true,
Hands that knew just what to do,
Never knowing rest or play,
Folded now—and laid away;
Work of six in one short life—
Shattered woman,
Dan's wife.

—Mrs. Woods.

*

THE appointment of a woman as Commissioner of Correction in New York City does not seem so very surprising after all. It was the devoted work of Elizabeth Fry that started the work of prison reform in Great Britain, and the philanthropy of Dorothea Dix that blazed the path for others in ameliorating the condition of the insane here. Indeed all through history we find devoted women who show their pity upon prisoners and captives, and it is quite fitting that a woman who has devoted herself to reformatory work should be rewarded by material honors. There are many little country towns to-day where practically the only reformatory influence extended to the county jail is the periodical visit of some good women, who may not be very learned, and not always very wise, but who are actuated by the same spirit as the English Quakeress who gave up her leisure to the degraded prisoners in Newgate.

*

ONE of the pleasant reminders of New Year's Day was a neat little box with the following label:

COMFORT POWDERS.

To be used in all cases of disease, sorrow, lack of courage and discomfort of any kind.

Take one powder every morning, thoroughly stirred with equal parts of loving trust and gratitude. Repeat the dose often.

Compiled from the medicine book of the *Great Physician.*

Inside the box were about two dozen little packages in red paper looking exactly like the pills or powders prepared by doctors. Opening one at random there was disclosed a slip of paper on which was printed:

"There shall no evil befall thee, neither shall any plague come nigh thy dwelling.—Psalms 91:10.

Each "powder" contained a similar slip with an appropriate passage from the Scripture. After reading these "powders" are to be wrapped once more and well mixed together so that they may be "taken" at random. Here is a new and effective variety of the good old way of inducing mind to climb up above matter.

A FARMER'S wife writes that she cares very little about fashions or how women "deck themselves out." Once in a great while is often enough for her to read about such things. On the other hand, and almost in the same mail, come letters from wives and daughters who say they want to know what women are wearing and how to make the pretty little things which add so much to a woman's dress. It is evident that the great majority of our readers want to know how they can, with their own hands, and with such material as they can find, make the things which will enable them to dress well and becomingly. We are in full sympathy with this discussion of "fashions," and such discussion will be conducted by women who know how to fit the sensible effects of Fifth Avenue to the needs of the country home.

*

ONE essential part of direct and profitable trade is bright and "catchy" advertising matter. In these days people are tired of dry statements of facts, and some strong and original way of putting a thing is sure to give it profit. Here is an illustration from the card of a Florida poultry keeper. We all think of Florida as a land of oranges, but few know that hens find it a paradise.

EGGS VS. ORANGES.

The same amount of capital and labor that is required to produce a box of oranges will produce a case of eggs. The box of oranges will sell f. o. b. for about $2.50, while the case of eggs will sell f. o. b. from $9.00 to $14.00 in the same market. There is about the same per cent. profit in a case of eggs as there is in a box of oranges. (Investigate).

This man appeals to the imagination. Everyone has a box of oranges in mind, and by associating eggs with oranges the reader is compelled to stop and think of the connection. We hear through the brain, and we must sell to a direct trade that way too.

*

A PROMINENT educator in Ohio said not long ago that no one was really fit to teach a school until *"some little white coffin had been carried out of their home."* What he meant was that only those who had children of their own, and could thus realize the parent's attitude toward the child, should teach in our public schools. What a contrast is presented between this and the attitude of the New York City Board of Education. They claim that the mother has no place in the school room, and they will, if they can carry out their plan, discharge married teachers who have children. There are said to be 1,000 married women teaching in the New York City schools. The courts have finally decided against the school board and denied their right to remove a married teacher who asks for leave of absence in case of maternity.

*

THERE is a story going around of an old farmer who came home at the close of a market day, looking quite puzzled. He had a string tied around his finger, and his daughters asked him what it was for. He told them that while in the town he tied that string around his finger in order to remember to bring something home, and now to save his life he couldn't remember what it was. The daughters tried to help him, but were unable to jog his memory, until one of them asked "Where is mother?" "Why," said the farmer, "I have actually forgotten to bring your mother home, and that's what I tied the string for." Of course, this story originated in the brain of some funny man, who tried to earn a dollar by making a joke of this sort, and yet after we laugh at it and say how absurd it is that any such thing should happen, it may do us all good to spend a little time in thinking whether mother is really ever forgotten or not. For the good patient mother often goes too far back in the meeting, and takes a seat too far back from the fire, when the younger people, busy with their own interests, do not realize that perhaps they are playing somewhat the part of father when he left her in town.

*

SEVERAL new "chain letters" are floating about through the country. The latest one is headed: "A letter from Christ." It contains about 900 words and carries a veiled threat that if the receiver does not copy it and try to have it published misfortune and loss will follow. A few years ago such letters urged the receiver to send a dollar's worth of cancelled stamps to a certain address in Australia, and millions of those worthless stamps were sent. The postal authorities try in every way to stop the circulation of these letters. They are useless and often mischievous. We hope that those of our readers who receive such "chain" letters will break the chain at once and take no further notice of such schemes.

*

I HAVEN'T much hope that much can be done for the *average* grown person. The average grown person has his or her habit of mind pretty unchangeably fixed. Some can take in new ideas, and some are always students, but mostly, I think, our hope lies with the children. The soft wax of their brains is all ready for new impressions. And I do not know but that the best way to reach the elders is through the children. The new ideas that the children can be got to advocate with their fresh enthusiasm at home will go farther, perhaps, than all our preaching.

D.

Have you considered that perhaps we have done too much preaching—or preaching of the wrong sort? We had a man tell us the other day that he was *compelled* to go to church until he was 21, and then kept it up for a few years from habit. The preachers thundered at him and expounded doctrines, but they "never touched him." Finally came a man of gentle, simple words, who somehow put a vision or picture before this man—something he could not put out of mind—and the work was started. There are wise and good people who go at their audiences as if they would cut into the head with a cold chisel and pack some of their science away inside. They find this "wax of the brain" too hard. Soften the "wax" through unconscious thought and the impression will take. It is in just this way that children influence such parents. Why not imitate the children?

*

On page 85 is a statement of the property rights of women in Pennsylvania. There will be articles to follow on the rights of women in the holding and training of their children. We have been asked about the women's pension law in Pennsylvania. The following statement covers it:

"We have a mother's pension, which is to indigent, widowed, or abandoned mothers who have continuously for three years been residents of the county from where they may receive relief for the partial support of their children in their own homes. The combined total maximum payment to one mother must not exceed $12 per month for one child; $20 a month for two children; $26 for three children, and $5 for each additional child. The payments last only until the child reaches the age when the law permits it to be employed. It is managed by not less than five, nor more than seven women trustees. The State appropriates a certain sum of money for this relief every two years, according to the population of the counties, the county must put up an equal amount. Satisfactory proof must be had before any recommendations are made."

*

CAN you suggest how I should proceed to make a comfortable living for my father, aged 84, and myself, near middle age, on a 30-acre place, 10 acres level tillage and 20 in pasture and wood, in southern New Hampshire, seven miles from town of 6,000 inhabitants? I purchased the place three years ago, paying nearly cash for it, and bought two cows and a horse and a few tools. I plant 2½ acres to corn and potatoes, and nearly one-half acre to garden truck, but frosts early and late interfere with beans, cucumbers, tomatoes, etc. I work out all the time I can spare after attending to my own work, but so far make a very poor living. My father is able to do most of the housework except the cooking, and I do most of that evenings. I wish to make the farm produce an income sufficient to supply our simple needs, but the outlook at present is discouraging. Dry weather last Summer made the hay crop short, and I have had to purchase hay this Winter, but think the place should produce hay enough for five cows and a horse when brought to proper state of cultivation. Before coming here I worked in a shop for 10 years and saved quite a sum each year, enough so that I was able to buy this little farm. I like the farm and will stick to it if there is any chance of getting ahead. Can you give me any ideas that will put me on the right track?

A. S. A.

Here we have a genuine life problem for which there must be some remedy. We know how hard it is for a stranger to advise in such cases, for the personality of this man must be considered, and we do not know it. Yet here is a brother with a hard task, and one which must demand our sympathy and help. Who has had experience that will help him? He does not want theory or random advice, but rather practical experience, and it is largely a housekeeper's job. THE R. N.-Y. has been made strong through the kindly and sincere help of its readers in just such cases. In the same way "Woman and Home" can be made to serve its purpose.

*

WE find that hundreds of women are developing a direct trade in food by parcel post. The women do this better than the men, and there are many opportunities. A New York man used our Subscribers' Exchange to call for food supplies. He received a good many offers to furnish butter, poultry, eggs, fruit and vegetables, and is buying from five different people—each supplying some particular food. He is well pleased. The goods are of fine quality and he makes a saving over city prices. The towns and cities are full of just such people, and direct trade with them offers great opportunity for farm women. In order to develop it one must be patient and accurate, prompt, and wise enough to give customers just a little more than they expect.

*

VERY few farmers hesitate to spend $50 on improved farm machinery, to carry on their own work, and they should consider the many steps, the drudgery of carrying heavy pails of water, and the exposure to bad weather which such a water supply saves the members of the household, to say nothing of the practical economy of preserving milk, butter, etc., fresh during the hot Summer days.

Virginia. MARY LEE C. ADAMS.

A description of the water system in Mrs. Adams's house is printed on page 83. She is entirely right. A good water system inside the house should be regarded as just as necessary as improved machinery on the farm. THE R. N.-Y. will make a campaign for water in the house, just as it has for Alfalfa, lime or parcel post. Let the men folks be warned. We shall make them all hot water men.

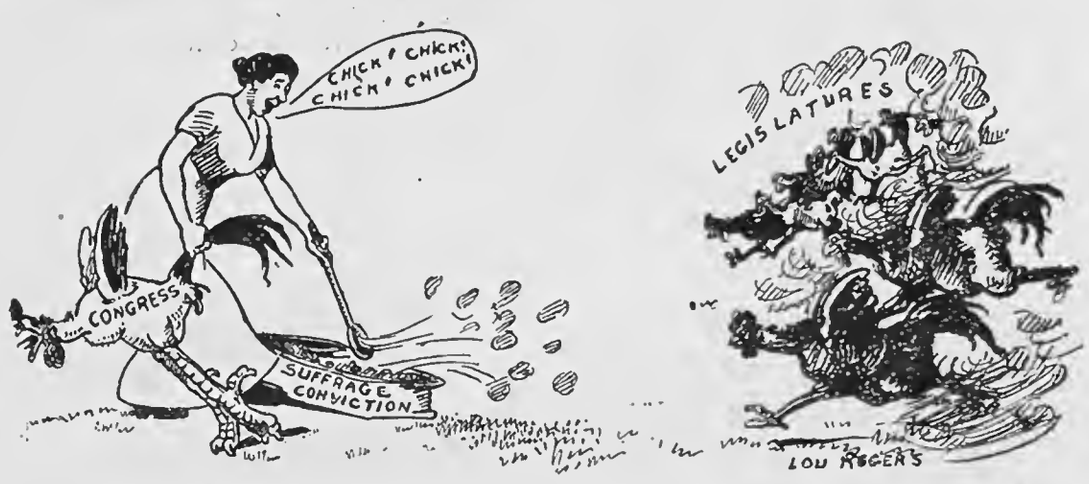
*

WE have been reading the "Letters of a Woman Homesteader" in the Atlantic Monthly, which are, we are told, the actual correspondence passing between a woman on an isolated ranch and a friend in town. The Eastern farmer's wife who thinks herself a "shut-in" because fate puts her on a hill farm four or five miles back from town would learn the meaning of real isolation from these letters, which are written so delightfully tha they give us a perfect picture, not only of surrounding conditions, but also of the courageous and light-hearted woman who wrote them. But there is one very dark side to the pleasant pictures of the wholesome ranch life, and that is the misery undergone by the women in sickness, and especially in maternity. There appeared to be, in too many cases, no help, medical or otherwise, and the sufferer must endure her burden as best she may, taking the risk of death or invalidism. It is just these conditions that have lead, in Australia, to the beginning of a great movement to supply trained nurses to the "back blocks" or frontier, the intention being to provide a nurse for a certain area, so that isolated women could receive care and hygenic instruction, even where no doctor was accessible. In the city, with abundant facilities for medical treatment, district nurses are provided both by public and private agencies. The country, which so sorely needs them, is without. Some of the Granges have, we believe, already put themselves on record as favoring the establishment of rural nurses. We think this is a matter to be taken up by farm women. In all our schemes for conservation of National resources, we cannot find any worthier assets than the life and health of the farm mother.

PERHAPS there are a few things we are apt to pride ourselves on as our good taste and culture. It is really no matter for pride at all. Good taste is a more likely comrade of humility, and goes with a childlike reverence for the work of the Creator as shown to us in the clouds, the mountains, the waves, the forests, the flowers, and in the flight of birds. These are examples of the highest attainable in beauty of form and colour.—Sydney Spalding.

"VOTES FOR WOMEN."

The cartoon on this page is taken from the Woman's Journal, the old and influential advocate of "votes for women." Probably this expresses fairly the attitude of the wiser and saner advocates for suffrage. They realize that the way to influence Congress is through popular thought or demand, and this is best expressed through the State Legislatures, and so they propose to hang on to Congress by the most convenient handle while they throw feed in the way of argument for the State legislatures. Without doubt these legislatures are coming, for more than ever before their members are being influenced by the folks back home. Everyone knows that when sensible and determined women make up their minds that they want a certain thing, they prove the worst hangers-on of any class of citizens. There is no escaping them, no frightening them, or bluffing them away when they are once convinced that what they are after is right and true. The advocates of "votes for women" will be wise if they follow out this idea. Hang on to Congress and get the legislatures



UNWILLING CONGRESS AND APPRECIATIVE LEGISLATURES.

coming. We have been asked by both the advocates of suffrage, and its bitter opponents, to take their side of the case. During the past year we have made what seemed to us as fair a test of the opinion of our readers as could be made. We quietly arranged with several people with whom we were well acquainted to make an actual personal canvass of the farm women in their own neighborhood, and asked them quietly and fairly how they stood on the question of suffrage. A great many people conducted these interviews, chiefly in New England and the Middle States. The result was that six out of eight women thus interviewed declared that they didn't wish to vote, or were not interested in the subject. Not satisfied with this, we took at random again and again a large number of names of women from our list, and asked them by mail to express an opinion. This was also confined to the Eastern States. The result was the same, with an even more decided expression against "votes for women." We concluded that in the East at least the movement for suffrage is very largely an industrial one, strongest at present in the towns and cities, among women who work for their living at manufacturing or business employments. We should say that in the Eastern States the movement is largely among those who are fighting for fairer industrial treatment in their work. At the same time it is unquestionably true that whenever country women have the case put before them fairly, by some advocate who has made a thorough study of the question, they change their minds, and we think a much larger proportion of them will join the cause. It is also unquestionably true that all the reliable reports which come to us from those States in which woman has been given the ballot, there is uniform testimony to the fact that political conditions have improved. Without argument the liquor question, the question of social improvement, and matter affecting the health and legal rights of women and children, have felt the effect of woman suffrage, and in every case conditions have been improved. Evidently this is one of the things which have come up for argument, and cannot be put down. We shall give fair statements from women in those State where suffrage has been tried, and we are quite willing to give the other side of the case from those who are opposed to suffrage. Of course, these arguments must be fair and good-tempered. We want to get at the real truth of the case, in order that our women may understand it thoroughly.

REFLECTIONS OF A RURALIST.

An Egg Lecture.—One can hardly pick up a paper without seeing something about eggs—the city end of the egg. One would almost think no eggs were used in the country. Here there is something about the egg on its native heath. Housewife No. 1 has eggs to use, plenty of them, no eggless recipes for her. She put down a goodly supply in water-glass last Spring when the price was 23 cents. The fresh-laid eggs of good size are sold at top price. The pullet-eggs that are small, the invalid has. Housewife No. 2 has a few eggs put down in salt early in the Fall when the price was 30 cents, and better. She uses them sparingly and sells the scattering fresh laid at top prices. Housewife No. 3 has no eggs laid down, uses eggless recipes, cooks the occasional fresh-laid for "him," and goes without herself. These three had a common starting point. Each began with practically nothing. No. 1 hires No. 2 to help her occasionally; No. 2 is glad to help; No. 3 can neither hire nor do much herself. Tell me how a country housewife uses eggs in November and I will tell which way the wind blows. No. 3 is drifting toward a lee shore, No. 2 is backing to windward, No. 1 is heading out to sea. Now do not think it is too early to think of putting down eggs next season. When No. 1 began she found the local store did not keep water-glass but would send for some. It didn't come, and didn't come. "Be here sure next week." In the meantime eggs steadily increased in price. Another time the jar she uses had been taken by the man of the house for pork, causing delay. It is much better to be beforehand than behindhand.

Timely Help.—It is on that lee shore that the poorhouse stands. Our community is all agog over an old man who is close inshore. Will he be washed up on the shore or will some kindly hand rescue him? It is curious how concerned we are at the eleventh hour. It isn't pleasant, the thought that earlier in the day we might have trimmed a sail or bent an oar for him. But how about that young man with a family of little folks and little work, at this off season, or that other struggling man who had the misfortune to lose his cow, leaving the babies in a sad plight? It is at such crises as these that many become discouraged. We might if we would, carry a part of the load through the shoal water and keep the boat from grounding. We ought in some degree to feel responsible for the wreckage that dots the sea of life.

Prices of Groceries.

Under the heading of "Business," J. L. C. says, that housewives are paying six cents a pound for sugar, and that he is going to get a large bag for 3½ cents a pound. Just think how unreasonable that is. The raw sugar costs more than that, and any child can tell at a glance that sugar costs $4.35 per hundred in ton lots f. o. b. New York. Why did not J. L. C. tell the whole story, and say he bought $10 (or more) worth of other goods to get the price he named? My objection to the whole thing is this: I am a grocer, and see the practical side of this, and know that a good many women are going to their grocer, saying they know of people who are getting sugar at 3½ cents a pound, which is absolutely impossible; so much so that if J. L. C. will prove it, I will give $10 to him on convincing evidence. A lot more could be said about the practice of sending away for goods under the "club order" plan, but will touch on only one phase. Let us suppose that any one of many women in many towns, who send away for their supplies are members of a church or lodge, and are going to give a harvest supper or to hold a fair. Who is the first person to be solicited? Why, dear Mr. Brown, the grocer. He always gives. See? E. G. W.

In reply to this I give below two orders for groceries and other goods. Will someone tell me where I could have bettered them?

Nov. 24, 1913.

1 pair snow excludors, 3 buckle	$1.73
3 cans salmon	.53
3 mackerel	.53
3 clam juice	.25
1 pineapple	.22
4 pkg. figs	.53
5 pkg. cluster raisins	.67
20 lbs. rolled oats	.63
33 1-3 lbs. sugar	1.00
1 tea strainer	.02
6 cans tuna fish	1.10
10 lbs. peanut butter	1.50
5½ lbs. cheese	1.03
10 lbs. beans	.41
10 lbs. honey	1.57
3 lbs. horehound candy	.30
1 doz. soap	.50
1 doz. soap	.38
3 cans powd. soap	.20
3 whiz	.20
	$13.30

Oct. 22, 1913.

1 pair slippers	$ .72
1 pair woolnap blankets	1.98
4 pkg. Kneipp malt	.76
½ lb. cinnamon	.25
3 lbs. currants	.35
5 lbs. peanut butter	.73
12 bars Magic soap	.50
6 lbs. starch	.31
5 lbs. honey	.79
1 gal. molasses	.62
10 lbs. rice	.53
25 lbs. sugar	1.14
	$8.68

Our friend says that when the women hold a harvest supper the first person they go to for a contribution is Mr. Brown the grocer. That is probably because these women have for years contributed to Mr. Brown through high retail prices! He might well "come back." The rural population has largely drifted to the city, yet my old uncle, who remembers back two generations, says there are more grocers in the small towns now than when he was a boy. I am pleased to note that one woman wants to know where those large sacks of sugar come from. It is not necessary for women to buy the five-pound sacks even if they do buy from the grocer. I know by experience they will get it for you in larger sacks if you insist. C.

Cheaper, Quicker, BETTER than Plaster!

Before you build, investigate Bishopric Wall Board — the only Wall Board made with laths imbedded under terrific pressure in Asphalt Mastic which keeps out rodents, damp, heat and cold.

Nails to studding as it comes. No delay. No skill needed. No drying to wait for.

BISHOPRIC WALL BOARD

Takes paper, paint, kalsomine, or burlap as soon as up. Walls can't crack, shrink, bulge, sweat or warp. Every sheet is covered by a $5,000 Anti-Warp Bond. Saves half the cost of lath and plaster walls.

Books, Samples, Plans FREE

Write today for book, model house plans, and free sample Wall Board. All free.

A Million Dollars Can't Hire Us to Cheapen the Quality of "Ball-Band" Rubber Footwear

We could use cheaper rubber, hasty methods, less care in making "Ball-Band" Footwear for just a few months and pocket a cool million dollars profit. Why don't we do it?

For the same reason that money can't hire you to cheat your friends—we won't cheat the men who believe "Ball-Band" Footwear is the best their money can buy.

"BALL (Red) BAND" TRADE MARK

It's solid satisfaction as well as good business for us to know that eight million men are wearing "Ball-Band" Goods and talking them up as the strongest, easiest-fitting, longest-wearing rubber footwear under the sun.

Go to your dealer and talk rubber footwear with him. If he is one of the 45,000 "Ball-Band" dealers he will tell you how every kind of rubber footwear that bears the Red Ball trade mark is sure to give honest service. If he does not sell "Ball-Band," the best he can say for any rubber footwear he sells is, "It's most as good as 'Ball-Band.'" "Ball-Band" Boots are made with either rubber or leather soles and in four lengths—Knee, Storm King, Sporting and Hip.

They will give you more days' wear for the dollars they cost than you expect of ordinary boots. That, you know, is the proper way to figure the cheapness of rubber footwear—*on how much it costs per day's wear.*

Look up the store which shows the Red Ball sign in the window and ask for the rubber footwear which bears the Red Ball trade mark. It is your guarantee of quality. If the Red Ball is not on the goods, you are not getting "Ball-Band" quality. If your dealer cannot supply you, write us and we will see that you are supplied.

"The House that Pays Millions for Quality"

THE LAND OF FULFILLMENT

A STORY OF HOMESTEADING

By ROSE SEELYE-MILLER

CHAPTER II.

The New Brotherhood

"Hello, pard!" The boyish voice was full of grave anxiety, as the stalwart figure bent above a limp and white-feced object under a great tree. "Why, there's blood on his lips—and wet—about done for." The good blue eyes were full of sombre shadows as the strong young arms lifted Nate, and placed him upon a lumber wagon, near by.

"Git up there, Red! Step lively Roan," and Norman Duane using his ox goad as a persuader and encourager, started towards his own woodland cabin not far away. In the midst of the woods the boy halted the oxen, and bore Nate to the cabin, and laid him upon his own decent bed. He stripped off the sodden clothes, tucked blankets about him, and set to work to build a fire. Rubbing Nate's limbs with his rough hands, trying to force a hot liquid between his teeth. Norm was considerably astonished to have those teeth open suddenly and a voice cry out fretfully:

"Haven't I been soaked enough in rain, without being scalded into the bargain?" and Nate's arm that had been so inert, reached up swiftly, and dashed the cup of hot liquid away, almost before he had spoken.

"Your wishes, have considerable weight." Norm replied staring at the white face below him, "And you've broken a perfectly good bowl into the bargain."

Nate's dark eyes met the good blue ones, and he smiled wanly, "I guess—I must have—lost myself—a minute—" he said explanatorily.

"I guess you must have," Norm admitted laconically, "and I found you, and finding is keeping, so for the time being you belong to me, and you're going to do what you're told, even if you're told to drink scalding hot stuff." Norm laughed, from sheer joy, that this strange boy, had so unexpectedly come back to sane consciousness.

"Hand it over then," Nate said faintly, "I'd rather take hot pepper tea internally than externally though—Now remember that!"

"You can't have it now, you've spilled it, I say, and you get your arms under cover, you're as cold as a ghost, and about as white. Here," and Norman pushed a jug of hot water, to Nate's feet, and then put a hot brick on either side of him, and got more bedding and piled over him. "Now if you want to shut your eyes and faint away you can, but you don't use very good judgment, lopping down under a tree for that purpose."

Nate did not faint away, nor close his eyes, but he watched Norm as he went about his log cabin, as neatly and as deftly as a woman. Suddenly Norm paused, in his task, and spoke to Nate accusingly:

"Say, I'll bet your hungry. Now when did you have anything hot to eat?" sharply.

"I'll bet I am hungry, and as to when I had anything hot to eat, I guess about a week ago." Nate answered his inquisitor whimsically.

"Spots of Jupiter! No wonder you look as though you had pin-fever, with your legs swelled up as big as knitting needles." With a look of pity, Norm rushed about making ready a meal in the shortest possible space of time.

How like an Arabian Night's dream it all seemed to Nate, as he lay there snuggled under the warm blankets, with the hot water jug at his feet, and the bricks at his sides. Why, it seemed heavenly just to be warm again, for he had rallied at once under Norm's vigorous treatment. Norm fried bacon and eggs, he made coffee and cut great slabs of bread, then he drew his small table up close to the bedside, and placed the steaming hot food before Nate. "Wade right in anywhere," Norm said hospitably. "Or shall I feed you?" with a twinkle.

"Hardly," Nate replied also twinkling, and then both boys laughed unroariously.

"I didn't suppose you'd ever laugh again, when I picked you up out there in the woods."

"Well, I'd about made up my mind that I wouldn't laugh again myself, but it's easy enough to change your mind—if your circumstances change too. I'm in for a good time anyway," and Nate helped himself with Norm's assistance to the food before him.

"My, but this is lickin' good," he said heartily. "I wonder if I did die out there and if I've got to heaven—" Nate's dark eyes shone out at Norm luminously.

"Maybe, but I never heard of bacon and eggs in heaven."

"Nor red hot stoves and hot water bottles!" added Nate.

"It's pretty safe then to conjecture that you just struck earth a little harder than common."

"It's an awful good strike anyway," Nate said cordially, lying back on his pillows.

"You're not quitting are you?"

"Yes, I've had a full meal, but I guess—I'm tired—I kept trying to walk and get warm or get somewhere, and I couldn't do either—I seem to have to sleep an awful lot," apologetically.

"Go to it," Norm said heartily. "I'm going out to take care of the oxen."

Nate slept a great deal that day, and the next, but along towards night the second day, he slipped into his clothes, which Norm had cleaned and dried, and when that young man came in from his evening chores, Nate sat by the window waiting for him.

"This looks good," Norm's voice was full of pleasure.

"I'm all right now," Nate agreed, "I'll be ready to start out again tomorrow."

"Where are you bound anyway?" there was both curiosity and wistfulness in Norm's voice. "I wish you'd stay here."

"Why—" Nate gasped surprised—then seeing the look in Norm's eyes, he reached out his long, slim hand, and Norm grasped it with a crushing grip.

"Sit down," said Nate, "I'd like to stay—there isn't anything in the world that looks as good to me as this place and its owner does, but, I guess I'd better move along." Nate's voice was low and his eyes were looking far away.

"Sort of down on your luck," Norm said with understanding sympathy.

"Oh, I don't know, I'm lots better than I was," Nate paused—and then because Norm was so humanly near, and he, Nate, had been so inhumanly alone, he blurted out the truth. "The doctor said I'd got to strike for the high altitudes—somewhere West. So I struck," simply.

"How long you been at it?"

"I've walked about 400 miles, and I've got about ten more hundred to walk."

"Whew!" suspirated Norm. "Quite a contract," and Norm looked at Nate's long, thin legs critically. "If they were strong as they are long—" Norm began.

"Oh, they're all right—" deprecatingly. "they've carried me to more pleasure than I'd ever had in my life before. I hadn't slept in a house since I started, until you put me to bed here. If 'twould only stay pleasant I'd get along, or if there were barns or haystacks close enough or convenient when a storm came up, but people are inconsiderate enough to put such things out of my direct road. For I've gone straight West ever since I started."

"What are you going to do when you get there?"

"Why I'm going to take up land, you can get it for almost nothing, and I've lived on almost nothing. If I could manage to get there and get a tent, and anything to eat—it doesn't cost hardly anything to eat—if you eat simple. A 25-cent sack of cornmeal, made up into mush, 'll last most a week—and you can pick up a tin can and dip water anywhere to cook it in."

"Mabbe a fellow could live so cheap he'd git over livin'," Norm put in thoughtfully. "What are you going to do to pass away your time? You won't spend much in cooking."

"I figure on getting a piece of stony land—the stoniest I can find. I'll exercise my muscles and get lots of deep breathing picking up stones." Nate spoke quite earnestly.

Norm laughed out uproariously. "Say, I know a man who's picked six hundred loads of stone off of ten acres and there's plenty left."

"And how are you going to haul all those stones you pick up? You can't carry them away yourself?"

"Glo-ry!" said Nate, "I'd never even thought of that! If I had a team of oxen, like yours, they'd be just the thing. Quiet and slow, they wouldn't mind standing still all day, waiting for me to dance around and get a load."

"They're the best team in the State." Norm said warmly, "and they'll do what horses won't do or can't do. They're patient, and noble and easy to keep!" Norm enumerated all these valuable qualities enthusiastically. It was easy to see how much attached he was to that identical yoke of oxen.

"How much are oxen worth?" Nate inquired, vaguely speculative.

"Oh, all prices. I wouldn't sell Red and Roan for a bunch of money. They're all the relations I've got. I make a good living with them too. Haul lumber and loads, and plow for folks. Say—" Norm paused.

"I have a little bit of money laid up, that I earned with my work."

"I wish you were going along with me," said Nate, "you've got such a clear sight for the glint of the golden egg."

"That's just what I had started to say, when you interfered with that blamed cough of yours. I do want to go with you—" earnestly.

"What!" cried Nate. "Go with me—Oh, here's how," and Nate's slim, weak hand reached out to be lost in Norm's large, strong one, "Brother!" joyed Nate.

"Pard!" cried Norm. And so the compact was sealed, which should change and amalgamate their future lives. "There isn't a thing to keep me here. We can hit the trail as fast with Red and Roan as we could afoot, and considerably easier. Then too if you should have many such spells as you've been having the past few days, you might need a proxy to do your stone picking, on rainy days anyway."

"This is better than any nest of golden eggs I ever dreamed of," Nate said warmly and the large hand and the slender one met again in giant grip. "I guess I've got money enough to grub stake us on the trip," Nate said glowing, "I'll furnish the eatin's and you can furnish the oxen."

The boys sat long talking and planning, and the next morning Norm began selecting the things he would take with him out into the wide world of the West.

"We'll want all the tools, and shovels and axes, the fishing tackle and my gun," Norm rattled off happily, "and all the clothing, which isn't much, and the bedding, and the cooking things and the stove, it's small."

"I don't imagine we will want to cart out much furniture," Nate put in dubiously.

"There isn't much to cart, but I guess we won't take a stick of it." Deftly and quickly Norm packed his goods into a compact compass.

"I don't know, hardly what to do with the six chickens, and the cat," Norm looked askance at the hens scratching cheerfully about the clearing, and the cat rubbing against his rough clothing.

"Why, you couldn't leave them," Nate replied, "You might better kill them than do that. A cat's a lot of company, and the hens—they lay eggs, don't they?"

"You'll make a great farmer, won't you," Norm mocked. "W haven't half a load for the oxen, I've a good mind to put the chickens in a box and cart them along. We can eat them if we find we don't want to do anything better with them." And so Norm made a neat, slatted box, and installed the fowls therein. "I'm blamed if I'll leave this cat here to fend for herself, anything but a homeless cat."

"Let's take her for a mascot; she may bring us great prosperity or something."

Their last meal was cooked at the cabin, and the groceries and provisions were stored away safely on the wagon. Norm looked around his little domain thoughtfully, and his eye rested on a little pile of lumber which lay ready for use.

"I hate to leave that good lumber," Norm said meditatively. "I've a good mind to take it along—we'll need some lumber anyway," suiting the action to the word, Norm reconstructed his load, and piled the lumber on the long wagon, then the two boys in the highest kind of spirits and feeling like the oldest of friends started on their quest—the quest of fortune. Norm turned back for one last look—drew his hand across his face at the sight of the deserted cabin, and garden patch, which had already taken on that look of loneliness and abandonment common to deserted buildings.

"Sho!" deprecated Norm. "We can come back here any time, that little tract of land is mine, and it won't hurt the log shanty if someone should shelter in it. I wish I'd carved 'Come In' on the door—but then they'll go in if they want to—so—" and then both boys lapsed into silence, Norm walking beside his oxen and Nate riding, by Norm's insistence.

"You can walk sometimes to rest yourself," he had said, "but otherwise you're part of the load."

Slowly they lumbered onward, Norm stopping at the first little village he came to and getting his precious nest egg, to take with him.

"We'd better strike towards the railroad and follow West by that," Norm said, thoughtfully.

"I tried, that, but there were so many tramps I finally quit it, although I enjoyed an occasional chat even with a tramp, but my ways weren't their ways, nor their ways mine. I kept the main travelled road—or if possible keeping my direction and going through woods or fields. I always tried to find a stack of hay or straw or something to sleep in—or some out-house, where I could not possibly trouble anyone. I've lived mostly on rolls and cheese, getting a small supply as I passed through a town, and only enough to last till I could reach another place."

They jogged along steadily that day and until late that night, because they had not really put in a day's work on the road. Norm made a business-like camp, picketing the oxen in a rich, grassy place and near a stream of water; digging a little pit, and in this making a little fire, over which when it had burned down to red coals, he made some good coffee and broiled some rich slices of bacon.

"That's a great scheme, building a fire like that," Nate commented approvingly.

"That's the only woods way to make a fire," Norm replied. "Any woodsman must watch out that he sets no fire, and with this there is no possible danger, and a pail of water over the embers on quitting camp leaves everything as secure as it was found."

Both boys ate heartily, and it seemed to Nate he had never eaten so delicious a meal before. He fell asleep on a rich bed of pine needles, with the starlight sifting in upon him softly, and while he did not thank God in so many words for this new-found brotherhood, his whole attitude of mind was full of joy and gratitude. He had left home (?) without a "good bye," and had tramped many, many lonely miles without a friend, and then, when he seemed to have reached the limit of his endurance this wonderful thing had happened! A friend, a real friend, and one who would not be separated from him! Perhaps there would never be any separation. Such infinite comfort and quietness lay in this thought, his very sleep was made better thereby.

And so day by day the boys travelled onward. The trend of their travelling was northwest, and in spite of Nate's objection, they did finally follow a railroad knowing that by so doing they could not be led astray. The oxen made from 15 to 25 miles a day, according to the roads, and while this would not have been much of a walk for a man, it seemed good to Nate to lie in the blankets on the wagon, a good share of the time, although he often walked up a hill as a constitutional, breathing deeply in consequence, Norm did not think it best for him to walk more than a mile or two at a time, for Nate's cough still clung to him, and the color in his cheeks was not what Norm wanted to see.

In Minneapolis, the boys secured some literature about land, and it was a puzzle to them to know which golden opportunity to take, when there seemed so many, according to the glowing prospects, presented to the public. There seemed to be, then, a great deal of vacant land open to settlement.

"It will cost us about fourteen dollars to file on land," Nate observed, after some study of the land books.

"Well, I reckon, we can put up the price," Norm parried.

"I guess I've got enough left for that," Nate said thoughtfully. "But most things cost a good deal more than they're advertised to—I'm wondering just what our expenses will be."

"They won't be any more than the legal fees, we have our own team, and can do our own locating and haul out our own stuff. I believe it would be a good plan to buy here the supplies we think we will need for a few months, probably prices will be high in the new country."

Norm had been so long accustomed to buying his own supplies that he made a reasonable selection. Flour, cornmeal, oatmeal, bacon, and some tinned stuff. With these and other supplies packed compactly on the load, they were ready to go forward. Norm climbed on to the load beside Nate for the roads were hard and smooth, and they could talk much better when side by side.

"Now we must decide on some definite point for our destination," Norm said decisively. "We have made this jaunt with only 'some place,' in view, we must have a real location"

As the oxen jogged along, the boys looked over the land literature again, and finally decided to stop at the first place in Dakota (then a territory) where a land office could be found, and near enough vacant land to make filing feasible. They hit upon a place called Wetaske, not very far from the Jim River, and lying about 300 miles west of Minneapolis. Having settled this point to their satisfaction, and without much thought except that it seemed the nearest possible place, Norm jumped off the load, and with a hilarious, "Giddap!" to the oxen they started on the "home stretch," of their long journey.

The oxen were in fine fettle, and went along steadily and strongly, making, 30 miles a day for two days, but the third day proved to be an exceedingly warm one, it being now about the first of August. The way was rugged and difficult, and they were not making as much progress as they hoped to do, and when in mid-afternoon they came upon a thickly-wooded place, with a stream of water and everything ideal for camping, Norm thought it best to stop, and then get an early start the next morning, and so travel in the cool of the day. Both boys felt the heat, and were worn and dusty, for even Nate had walked a good deal, as the roads had been so rough and steep, riding had been no pleasure, and the load was heavier than it had been before they had taken on their new supplies. The whole outfit, boys and oxen seemed to rejoice in the cool shade of the trees. Norm unyoked the heated oxen, and when they had rested a little he fed grain, and picketed them out on a grassy plat, near a stream of water. The oxen waded out and stood knee deep in the water, chewing their cuds contentedly, and the boys after cooling somewhat took a plunge in the stream too. This refreshed them very much, and Norm went off with his gun to look for game, while Nate was ordered to lie down and sleep. This he did cheerfully enough, although he protested that he too should go along to help with the hunting.

"You stay right here, and 'knit up the ravelled sleave of care,'" Norm ordered laughing.

Nate slept and dreamed and dreamed and slept, the climax of his dreaming being that he was in the water, and the walls of the ravine fell in upon him with a terrific crash; with this he awoke to find that the crash had not been a mere dream, for the heavens were white with lightning, and the constant roar of thunder seemed almost deafening. For a moment Nate sat up questioningly, then looking about for Norm, but did not see him, nor could he see the oxen. The wagon, which stood in a comparatively sheltered place, would soon be drenched, and their precious store of food be ruined. To care for these supplies kept him busy for some time, for he had to lift them down and put them under the wagon, and then make a shelter of some of the lumber on the windward side to keep the rain from beating in upon them. He crept under the wagon too after his work was done, and the rain raged for a time, and then the sun came out. Nate rose and went to look for the oxen but he

could find no trace of them although he wandered around long searching. It had been sometime since the rain had ceased and still Norm did not come. What could be the matter? Nate had little woodsman's sense, but he was learning some, so he finally started out to hunt for Norm. He did not know where to go, but he took the general trend Norm had taken. Nate went forward slowly, a feeling of awe and depression creeping over him as he advanced into the depths of the woods. He whistled the whistle taught him by Norm, putting two fingers in his mouth, and shrilling forth a trumpet tone of sound. There came no answer but the dull echoing of his own call. Farther and farther went Nate, calling, crying, shouting, whistling, but no answer came back to his waiting heart. What could have befallen?

Nate had no idea how long he had tramped about the sodden woodland, but it had grown from sunset to twilight, and from twilight to dark, so dark in fact that he could no longer see to pick his way, and he stumbled upon the trunk of a fallen tree, and fell. His head struck a protruding tree root, and for a few minutes Nate lost consciousness from the impact of the blow. He lay there, when he came slowly back to consciousness, and he wondered dimly, dizzily, then vividly, anxiously, where Norm could be. It seemed as though he must have tramped the entire woodland over, and with the sense of depression much deepened, he struggled to rise. He knew that he had lost his direction, and the fall had set his head to throbbing painfully. He felt that he could not find the camp should he try to do so, unless by sheer accident, and he knew too that if he remained in the woods, he must seek some drier shelter than that afforded by the earth and leaves. Still his one obsession was to find Norm. Norm must be found and with that accomplished his world would revolve upon that axis successfully. Nate began to cough, roughly, harshly, and he raised himself as quickly as he could, to find himself facing an object, that sent a shudder all over him. For there upon the opposite side of the fallen tree lay Norm, his face looking wan and ghastly in the dim light. Nate noted the tree was rent and splintered, as he scrambled over it.

"Struck by lightning," he gasped as he bent over Norm's sodden form.

(*To be continued.*)

WATER SYSTEM IN A VIRGINIA FARMHOUSE.

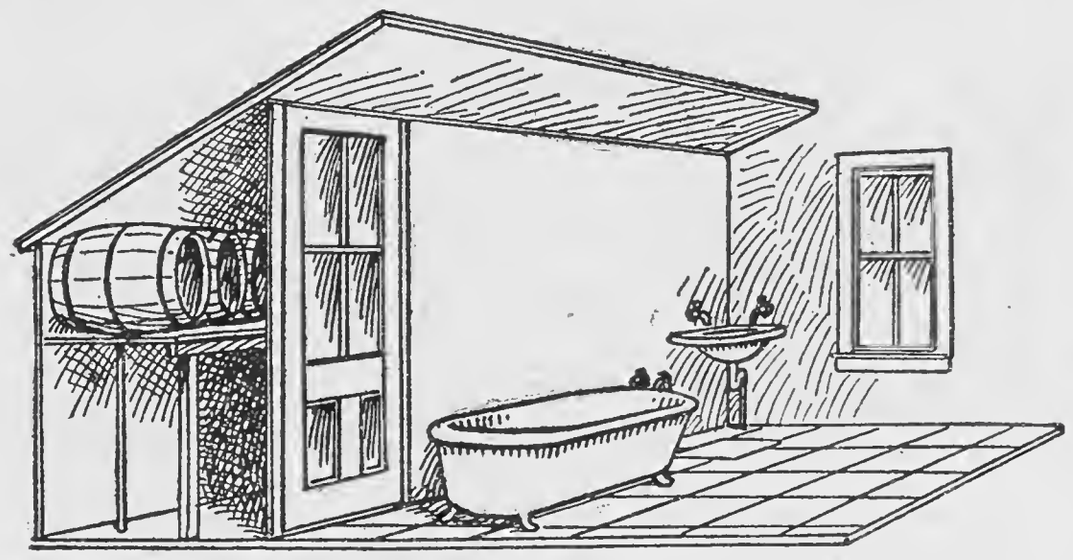
We have established a very satisfactory water supply in our home at such small cost that it must be within the reach of most country householders who own a nearby spring. The trouble and time saved soon pay for the outlay of $50 for materials. A spring about 500 feet from the house was carefully dug out and walled in with cement, in order to keep out surface water. A gable roof, with ventilated wire openings, was placed over it to exclude insects, leaves, etc. The spring-house was fitted, near the top of the cement wall, with an overflow pipe, which carries off the surplus water to a neighboring stream.

An inch pipe carries the water for 300 feet to a small $6 ram which has given steady service for two years without any attention whatever. It pumps the water through a half-inch pipe, to a 200-gallon tank, which is placed above a small room on the back porch called the milk-room. This room contains a large cement box in which the water is kept constantly fresh and cool by the overflow from the tank. Furnished with shelves placed at different levels, this box is a wonderful convenience in keeping milk, butter and many other foods, fresh and cold. The 200-gallon tank supplies the hot-water tank attached to the kitchen stove, and furnishes hot and cold water in abundance to both kitchen and bathroom. The bath, kitchen sink, and milk-box, afford more comfort and real economy than could be represented by any other $50 outlay. Any moderately handy man could install a similar system, which requires no expert workman.

MAY LEE C. ADAMS.

HOMEMADE WATER FIXTURES.

Some 10 years ago THE R. N.-Y. offered prizes for what we may call homemade bathrooms. It was stipulated, that the articles should cover homemade affairs, where the work was largely done by the farmer himself, without expensive plumbing or skilled labor. There are many situations where bathroom fixtures can be put into a house at light expense, and we were after such an outfit. We reprint herewith a picture of the outfit which won first prize. This was put together by W. N. Miller of Connecticut, who may be called an ingenious Yankee, quite handy with tools. He had purchased an old farmhouse, and the bathroom problem presented itself. At first they thought they would be obliged to build an addition, or take a needed bedroom for the bath, but they finally utilized the attic in the ell of the house over the kitchen. The entire room was ceiled with Southern pine, half an inch thick, and varnished to make a pleasing finish. The work was done at odd times, as the employment of a carpenter or plumber was out of the question. In place of a tank for the water, Mr. Miller put in what he calls a battery of six vinegar barrels. These are shown in the picture, mounted on a stout shelf. These barrels are connected together with piping, and give a combined capacity of 300 gallons. This little room is heated by an ordinary register, cut in the floor directly over the kitchen stove. A 40-gallon hot-water stove tank put on the kitchen stove



WATER SUPPLY FROM BARREL STORAGE.

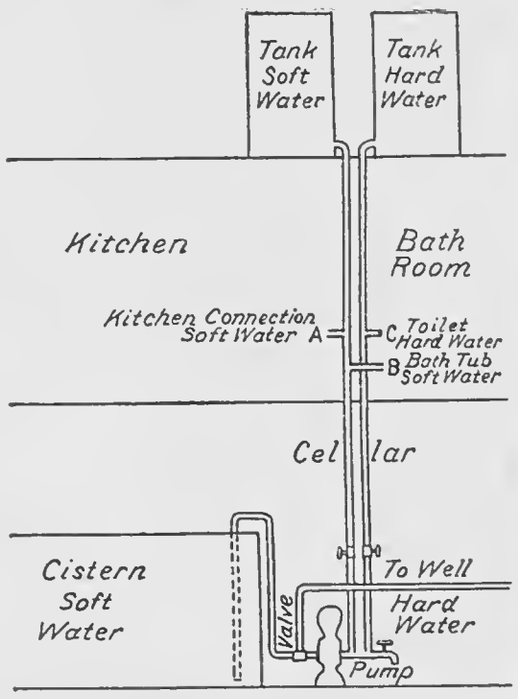
furnishes the hot water supply. Mr. Miller gives the following items of cost in putting up this useful outfit:

6 barrels	$2.00
Enameled bath tub	7.00
Force pump	5.00
Pine lumber	7.50
Studding	1.00
Nails	.25
4 faucets	1.80
Bowl and connections	1.30
Iron piping	4.25
Water back for stove	2.50
Hot water tank	7.50
Extras	7.74
Total	$47.84

The pumping was originally done by the force pump from the well, but now a hot-air engine has been installed, and also a closet. Thus for $50 cash outlay in this homemade plant, Mr. Miller was able to obtain conveniences which would be worth $100 every year to his family. There are thousands of locations where similar work could be done for the price of one cow, and no one save those who have such conveniences can realize what a blessing this would be to the entire family.

A WESTERN NEW YORK WATER SUPPLY.

The water system here described has given three years' constant service to a large farmhouse for bathroom, inside toilet and kitchen use. First cost was



ARRANGEMENT OF PIPES.

$50 for material; labor was done by home talent and at 25 cents per hour did not exceed $15. Like most farmhouses, we had a large cistern, soft water, in cellar, and a good well nearby. The first step was to connect these two sources by means of a three-way valve to a double action force pump in cellar; 1¼-inch galvanized pipe was used, the pipe to well being laid below frost. We next placed in an unused clothes press on second floor two round upright galvanized tanks 2½ feet in diameter and six feet high. These were made by a local tinsmith, and being small in diameter went easily through doors and into place. From the bottom of each of these tanks a one-inch pipe led to the cellar, one being tap fed conveniently to supply bathtub, sink and hot-water front to stove, the other tapped to supply toilet. These pipes united at the pump, but in each pipe near the pump a gate valve was placed so that either tank or both may be filled at will.

It has seldom been found necessary to draw on well, the cistern being sufficient for both tanks, so we open both valves and fill both tanks at once. In case cistern is running low we close valve in pipe supplying kitchen and bathtub, turn the three-way valve to cut out cistern and we have an unlimited supply of hard water for toilet, thus saving soft water for other use.

About five minutes pumping each morning is sufficient for the day's needs. Water in cistern is about same level as pump, total lift being 12 to 16 feet to tanks. This gives about five pounds pressure on faucets. The pump is worked easily by women of household, but this they are seldom expected to do. A faucet on side of soft water tank gives a supply of water on second floor if desired.

An addition, which is convenient, but which has not been figured in first cost, is 25 feet of hose, which is connected to pipes in cellar by a valve. Passing this through cellar

From Childhood to Old Age
Kimball Pianos
Are Pleasing in Tone
Write Today for Beautifully Illustrated Catalogue

Mrs. Piano Buyer Before making the purchase of a piano for your home and children we are sure you will want to see our catalogue—you will want to know about our new plan of selling and distributing our pianos direct from our factory and from our various factory distributing points. **Write us today for**

Factory Distributing Prices and Convenient Payment Terms

and learn how easily you can secure the STANDARD Kimball Piano for your home, no matter where you live, on terms to suit your convenience. Monthly, quarterly or annual payments can be arranged.

Valuable Features of the Kimball

Kimball Pianos possess many important exclusive features such as our *hermetically sealed* metal covered pin block—the heart of the piano—impervious to dampness, unaffected by heat or cold, strings scientifically treated to prevent rusting, and other valuable features that give the Kimball that *heirloom value* and most splendid musical quality.

Kimball Player-Piano Perfect in Detail

There are very few persons who are not lovers of good music. Unfortunately there have been but a limited number that could produce it, but now with a Kimball Player-Piano in the home, the young, the old and even the feeble "*indoor*" people can play and reproduce the "Grand Opera" or play any and all of the old time songs or popular pieces.

Cuts **Grease** and **Soot** From Kettles

One rub with "OLD DUTCH" will prove its marvelous cleaning power. Try it where grease and stains stick.

Does the work in half the time with half the effort.

Don't be without it – 10¢ LARGE CAN

A WESTERN NEW YORK WATER SUPPLY.

(*Continued from page 83.*)

window enables us to water nearby flowers, wash carriages, etc. It is kept coiled for immediate use, and might be valuable in case of fire in cellar or kitchen. Below is estimate of cost:

2 Galvanized tanks, 2½x6 ft., at $9,	$18
1 Double-action force pump	11
Piping, valves, fittings	13
30-gal. hot water tank	8
	$50

It should be noticed that the same pipe which fills the tanks also supplies the different faucets and bathroom, thus saving in first cost, reducing number of pipes in rooms below. To avoid running the tanks over when pumping a home-made electrical device rings a bell when either tank is full. This is simply a wood float which rises with water, causing two wires to lower into a cup of mercury, completing the circuit. We used the door bell already installed, so only cost was for wire, mercury and a two-way switch costing less than a dollar in all. This is not a necessity, but saves an occasional trip upstairs. I inclose sketch, which is shown on page 83.

Cayuga Co., N. Y. A. M. KOAN.

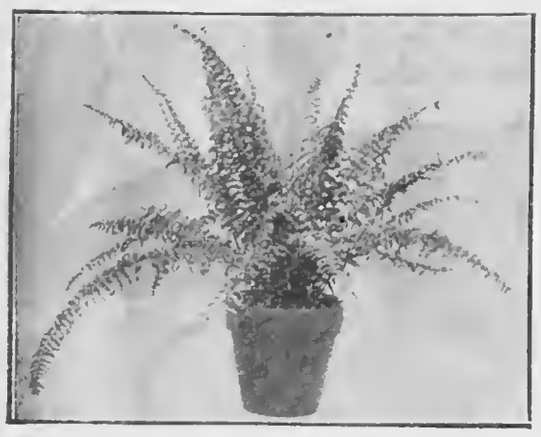
FERNS FOR THE HOUSE.

The trade in potted greenhouse ferns has now assumed enormous proportions; they are bought as individual specimens, and in pans or baskets, while florists use vast quantities of them in conjunction

PAN OF MIXED FERNS.

with cut flowers. Most of the varieties in ordinary commercial use are excellent for the house, if treated properly.

At the head of large single specimens the Nephrolepis continues to hold its place. The familiar Boston fern is a greenhouse form of Nephrolepis exaltata, though N. cordata compacta is often called dwarf Boston fern. Varieties of the Boston fern, with crested, slashed or divided fronds, are numerous; most of them are robust and desirable, and prove of distinct commercial value, though the ordinary type still holds its place. The Boston fern likes a good com-



A YOUNG BOSTON FERN.

post of loam and leaf-mold, with the addition of some well-rotted manure. There must be good drainage, as the plant needs plenty of water, but dislikes sour or waterlogged soil. In the Summer especially it will need lots of water, as the extensive root system will dry out the soil quite rapidly. During the Summer it may be out on the porch or in partial shade under a tree. We are accustomed to regard all ferns as shade-loving plants, but in the Winter the Boston ferns need all the sunshine they can get, and the house gardener must not push a specimen fern off into some dark corner, and then expect it to thrive. Yellow fronds often result from chill and starvation; the color becomes pale where the temperature gets below 60 degrees at night, in the Winter. An occasional dose of liquid manure, or a very small quantity of dried blood, will increase vigor of plant.

Insect troubles are few with the Boston fern; red spider or thrips sometimes appear in a dry hot atmosphere, but may be controlled by vigorous syringing with cold water. Several sorts of scale, or the pernicious mealy-bug, sometimes gain a foothold; the best plan with a single specimen plant is to rub them off with a brush or softened toothpick dipped in soapsuds. If the plant is clean when procured, there will be no trouble from scale unless infested plants are in its vicinity. The fancy Boston ferns, with crested or forked foliage, are very difficult to cleanse if once infested.

The small ferns in general use include Cyrtomiums, Aspidiums, Onychiums, Adiantums, Pteris, small Davallias and others; when made up in a group small plants of the asparagus vine often mingle with them. Cyrtomium falcatum and C. Rochfordianum are sometimes called holly ferns, because of their shining, slightly angular pinnæ, and they are both excellent house plants. They need good light and a reasonable amount of water; if allowed to dry out the fronds flag, and may be permanently crippled; it is not unusual to see house specimens in this condition. Our personal experience with Cyrtoniums is very favorable, as we keep them growing on year after year. After danger of frost is over these house ferns are all set outside for the Summer, in a partly shaded place. They must not be forgotten when taking their Summer vacation, for small pots dry out quickly, and they need copious watering.

The only maidenhair fern we have grown with prolonged success in the house is Adiantum cuneatum, and one specimen has stayed with us for over 20 years. The fronds are very airy and graceful, and as the plant prefers partial shade a north window will provide a congenial home. This maidenhair likes a temperature of 60 degrees to 65 degrees. In the early Summer it dies down more or less, and takes a partial rest, while placed in the shade outside; following the rest new fronds appear, and the plant is very attractive through the Winter. Our beautiful native maidenhair, Adiantum pedatum, which grows scarcer year by year, is desirable for a shaded border or window box during the Summer but dies down in Winter.

Onychium Japonicum is an Asiatic fern with light green finely cut fronds, very often used in fern pans; it requires the same treatment as Cyrtomiums, and is very dependable. Various forms of Pteris are very popular as house plants; they have fronds divided into strap-like pinnæ, some being crested and contorted. Among those most commonly grown in the trade are Pteris Cretica and its variety Albo-lineata, which has a broad white line down the center of the pinnæ; P. serrulata, light bright green, with many crested forms, and P. tremula, with bright green pinnæ on slender chestnut-brown stalks. The different forms of Pteris being strong growers, they are likely to become starved when crowded into a small fern pan with a number of other plants, and P. tremula especially will soon lose color with starvation; occasional doses of liquid manure will keep them in condition.

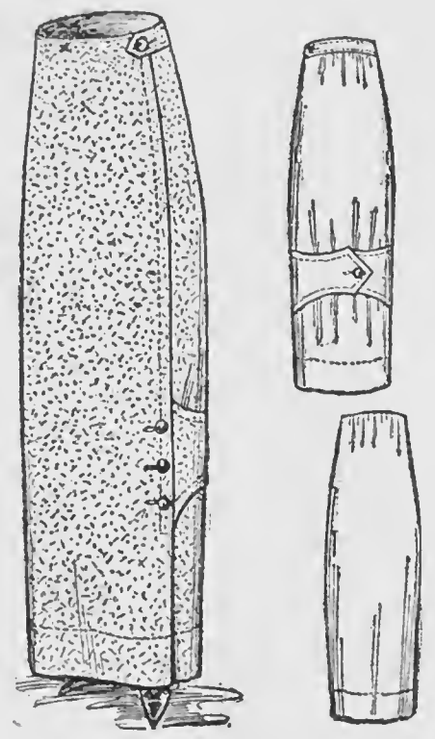
When the house ferns are put outside during the Summer, be sure they are brought in before cold Fall rains start. Many house plants, especially ferns, palms and rubber plants, get a check at this time that they never recover from. The chill received from a cold rainstorm at this season affects the fine root system, and damaged foliage results.

Several of the smaller Davallias are used in fern dishes and hanging baskets, some of these being used for the quaint monsters twisted into monkeys and other forms by the Japanese. The creeping rootstocks, covered with light brown scales, look almost like rabbits' paws. As a summary of fern-growing in the house, don't thrust them into a dark corner because "they don't need sun"; water them regularly; see that drainage is good, and feed them before they become starved. The loveliest and more delicate of ferns (apart from some tropical sorts) may be grown in a Wardian case, which is now old-fashioned as compared with the widespread fern dish.

THE RURAL PATTERNS

When ordering patterns always give number of pattern and measurements desired

PRICE OF EACH PATTERN, 10 CENTS



8030 **Two-Piece Skirt, 22 to 30 waist.**

With or without Trimming Straps, with High or Natural Waist Line.

8029 **Faacy Blouse, 34 to 42 bust.**

With Long or Elbow Sleeves, with or without Peplum and Chemisette.

Stamped on the best pure white linen, with mercerized floss to work.....$ .30

No. 738. A design for embroidering the ends or a dresser scarf twenty inches wide.

Dresser and Scarf. Stamped on best round thread, white linen, 20 x 54 inches.....$1 .98

One dozen of 12-yard skeins of mercerized floss in two sizes.....$ .20

The Woman At Law

[Under this heading we shall discuss the legal rights of women, particularly as regards their property and their children. There will be direct answers to actual questions and general statements of law.]

MARRIED WOMEN'S PROPERTY RIGHTS IN PENNSYLVANIA.

We are much interested in your article on married women's property rights in the State of New York, but what we want here is married women's property rights in the State of Pennsylvania, and would be glad to have you give them fully, as we are led to believe they are quite different. M. B. A.

Pennsylvania.

The laws of the State of Pennsylvania in regard to the rights of married women are somewhat behind those of New York, but changes are being made each year, so that in the near future it is hoped that married women in that State will have the same rights as are generally given to them in the other States. In brief, they are as follows:

In 1893 a law was passed giving married women the same rights and powers over all property, real, personal, and mixed, as has an unmarried person, with the exception, first, that she cannot convey or mortgage her separate real property unless her husband joins in the conveyance or mortgage, and any separate deed, lease, or mortgage in which her husband does not join is absolutely void except where her husband has been declared a lunatic, when she may dispose of her separate estate by deed or otherwise, or bind the same by mortgage as fully and completely as if unmarried, without it being necessary for her husband to join in or consent to the deed or mortgage; but she may mortgage her separate estate to secure her husband's debts and, although she may not mortgage her property, she may sell, assign, transfer, or satisfy a mortgage or judgment as if unmarried. Second, she cannot become an accommodation endorser, maker, guarantor, or surety on the note or obligation of another. If she is of full age, she may transfer railroad stock and bonds or stock of any corporation created under the laws of Pennsylvania, as if she were unmarried. She may keep a bank account in her own name and draw money on her own check, or receipt, without the consent of her husband.

Any married woman of full age may hold stock in any savings fund, building or loan association, and have all the rights and privileges of other members, including the right to borrow money from them and bid premiums therefor and to secure the loan by assigning her stock or other securities or by executing bond and mortgage upon her separate estate, provided her husband join in the bond and mortgage. When living apart from her husband under articles of separation, she may convey or mortgage her real estate without joining her husband and she may sue in divorce without a next friend, that is, may bring an action of divorce in her own name. Where property is claimed by a married woman as against the creditors of her husband she must show very clearly either that she owned it at the time of her marriage, or else acquired it afterwards by gift, bequest or purchase, and it is upon her to prove conclusively that she paid for it with her own funds or which were furnished by her husband during his solvency without fraudulent intent, and unless she does so prove and does make such claim, it is presumed that her husband furnished the means of payment.

A number of rights have been given to married women of late years, such as that of 1911, in which she was given authority to make conveyances of real estate directly to her husband as if she were unmarried, and by the same law all conveyances of real estate which had previously been made by any married woman to her husband, which had been duly executed and delivered, were made good in law. A married woman may sue and be sued civilly and in all respects and in any form of action as an unmarried woman, but she may not sue her husband except in her proceeding for divorce or in a proceeding to protect or recover her separate property; nor may he sue her except in a proceeding for divorce or in a proceeding to protect or recover his separate property. And in 1913 a law was passed by which a married woman who has been deserted, abandoned, or driven from her home by her husband may sue him upon any cause or action whatsoever and she is a competent witness against him in any such case. She may dispose of her property, real or personal, by will, but she cannot affect her husband's right to his tenancy by courtesy in her estate (which means that he has an estate for his life in her lands at her death), nor his right to take against the will as provided by existing laws.

A widow is entitled to $300 out of the husband's estate, payable in preference to debts and legacies. She may take the $300 and also what the will gives her, although the gift be expressly in place of this sum, unless the gift by will be in the alternative. Her dower right at his death, which is a one-third interest in his property for her life, attached upon all the land owned by her husband at the time of marriage or acquired by him during the marriage, and to bar this right the wife must join in the deed to any property, and if her husband conveys land during the marriage without his wife joining in the deed, her dower therein is not barred, and if she survives him she may recover one-third of such land from the buyer.

Wife's Right to Husband's Personal Property.

Can you tell me what a wife can hold out of her husband's property if he dies without a will, and the property is less than $2,000 and is with the exception of two or three hundred, all mortgages and accounts? A. R. S.

New York.

It is hard to tell what proportion would go to the wife, unless we know how many other relatives and what relation they held to the husband. As this is personal property, if there was left a wife and children, there would be no inheritance tax to pay on the estate but all of it would go to the wife and children in the proportion of one-third to the widow and the rest in equal portions to the children or their representatives.

Property of Incompetent Wife.

My wife is evidently losing her mind, and I feel that she is incapable of doing business. She has some property in her own name, which I could use to advantage. Under the circumstances, believing that her mind is unsound, would I be justified in handling and using this money without consulting her? L. M.

You would not be justified in using your wife's money at the present time, any more than you would if she was in her right mind. The proper procedure for you is to petition the court and have her adjudged an incompetent person, and have a committee of her person and property appointed, and this committee, with the leave of the court, may use her property for her support. But until this is done you should not use her money in any way, as you have no more right to it than you have to the property of a stranger.

Wife's Claim Against Husband.

A woman has property in her own right, and lends all her part of it to her husband for his personal business. She takes no note, or other acknowledgment from him, but he handles the money. In case of his death how could this woman proceed to obtain her money back, or how could she obtain it now in case of her need, or of any trouble with her husband? J. B.

A married woman may deal in property with her husband the same as with a stranger. There is a slight presumption, where no evidence of the loan is made, that the property was given to the husband as a gift which would have to be overcome by some evidence. In case of the husband's death the wife would proceed to prove her claim against his estate the same as any other creditor. The only trouble in this case is that she has no evidence of her claim other than her own word, and this would make it harder for her to prove her claim now or after her husband's death, and it is always wise, even in family matters, to take the same precautions in regard to loaning money as it is when dealing with strangers. It saves a great deal of unnecessary trouble later. She should first get from her husband some acknowledgement in writing of the indebtedness. If he will not give this, nor pay her, the only alternative is to bring an action against him.

THE ADOPTED CHILD.

PART I.

Why the Adopted Child?

[NOTE.—This article will be followed by others on the physical, mental and moral training of the adopted child.]

Before entering the field for considering the care of the adopted child, it may be worth while to answer the above question. One can answer it in all conscientiousness and good faith, and at the same time be fully conscious of not having attained the highest degree of success, as may be evidenced in the lives that have been committed to one's care.

Why the "adopted child?"

We will use this term to include any child not our own, the ordering of whose daily life becomes our duty, as well as the child legally adopted.

Why this child, or children, of other parentage than ours in our homes?

For two very simple reasons which may also apply to any effort to do one's duty in the world. First, because of the need of such child or children; and second, because of our obligation to meet this need. The world's history is full of the struggles of orphan children, and many worse than orphaned, the children of irresponsible parents. The fiction of all ages has chosen such children to be the types of heroes and heroines. Why open our homes to them when institutions may care for them?

However good and well managed an institution may be, it cannot do for the child what the home and family life should do. To be sure an institution is far better than no home; but, except to meet temporary needs, it is not an acknowledged success in the development of real character. The notable exceptions to this statement are the orphanages founded by George Muller and Dr. Barnardo, both in England, where orphans by the hundreds were trained into noble men and women. The very spirit of the founders of these orphanages seemed to enter into the lives of the children there; but George Mullers and Dr. Barnardos have not lived in great numbers in this world of ours.

Since institutions, then, cannot meet this great and obvious need, it remains for the homes of our land to do it. Not every home, of course. Many houses in which people dwell would be poor places, indeed, for a homeless child. We all know them. Yet it need not be the exceptional home, or one seeming to offer exceptional advantages. It should be, though, a home in which there exists a genuine love for children and for child life. To those who have such love for children life holds few things greater than the satisfaction of watching the physical development of a child, and the unfolding of the mental and spiritual natures; and the more unpromising the child, the greater the satisfaction.

Why our obligation? Some twenty centuries ago we were told that "To whomsoever much is given, of him shall much be required."

To most of us there comes a time when we must answer the question, "Who is my neighbor?" Then it will be for us to decide whether we will be the priest or the Levite and "pass by on the other side," or will prove ourselves "neighbor" to some one in need, oftentimes a little child.

Let no one who is unwilling to make sacrifices assume this obligation; nor should anyone do so who magnifies the sacrifice involved. Rather let him count among his blessings the influences that react upon his own nature. Everything in life that is worth while *costs;* and, if we would possess it, we must pay the price. We women hold that motherhood is the best that life has to give. Yet what is so costly? Mothering some motherless child may be counted among the next best things, and it, too, costs; but it is well worth the price.

When considering the matter of taking a child, it is surprising how much opposition one meets. "You are taking a great risk." "That child may disappoint you and bring you great sorrow." "It is not fair to your own child." Thus go the criticisms; and the eyes of the critics are ever open to watch for any seeming injustice. Confident in one's own integrity of purpose, a deaf ear can, and should be turned to any and all such; but let no one assume the care of a child who is unwilling to pay the price.

Possible disappointment? Yes, disappointment, time and again. Yet, consider over and against this, that no honest, earnest effort ever can be wholly lost; and that the one for whom the effort is made *must*, of necessity, be the better for the love and care expended.

One frequent cause of disappointment in the results of years of care and devotion to a child arises from *expecting too much.* This is also true in other relations of life. While we should have high ideals, yet there is danger of idealizing; and this, of necessity brings disappointment sooner or later. In the case of children of unknown heritage and limited possibilities, it is manifestly unfair to exact or expect too much.

The experience of all organizations whose purpose is to find homes for homeless children proves that many people who take a child are often unjustly exacting, as well as impatient of the child's development. There are cases on record

A PRIZE PACKAGE OF HUMANITY.

in which a child has been returned to the organization to be placed in another home, after months and even years of being "on trial," during which time the child's name was changed, as well as every condition of life. Oftentimes the only apparent reason for such action was that the child was expected to be a model child—something a little less than an angel. In some cases there were reasons for which the child was not in the least degree responsible, such as that would-be parents concluded that they were too advanced in years to modify the conditions of their lives as necessitated by the presence and care of a child. This uprooting must be both painful and demoralizing to the child, and may leave a shadow on the little life; but who shall say that in the end the child is not the gainer and the home left behind the loser?

The possibility of being disappointed in a child is, then, no argument against taking one or many. Recall instances, only too frequent in the most limited circle of acquaintances, in which *own* children have been bitter disappointments. "How sharper than a serpent's tooth it is to have a thankless child!" Should the disappointment in an adopted child ever be so severe as that of one's own flesh and blood?

Is the taking of a homeless child unfair to own children?

Quite the contrary—in any home worthy the name. Such homes and parents must have high ideals of character, and a desire to develop the traits of generosity and unselfishness. What better opportunity can be had than to teach an own child to "share and share alike" with other children less fortunate, in no patronizing way, but as a matter of course, all being practically on the same basis? This applies to externals, and in so far as may be possible, to the sharing of affection also. Yet, it is expecting too much of human nature to require the same degree of affection in the one case as in the other. This opens up a topic too comprehensive to be more than touched upon here, that of the place in the heart in which each child is held. Is it not, and must it not of necessity be a little corner for each one, differing in both kind and degree even as their natures differ? Surely every personality with which we come in contact means something entirely different to each one of us; then how can thought or feeling ever be exactly the same for any two children? Indeed it is better that it should not be. The question of justice or injustice will not enter into the situation with persons of right feeling and intentions. One can afford then to ignore suggestions and criticisms, secure in the belief that, as we may not expect to fit the same hat or coat to each child, neither do we hope to deal with all children in just the same way. In fact, one of the inherent rights of a child is that his or her distinct individuality be considered.

The *one* thing to be kept persistently in mind is that results are not in our hands. When one conscientiously cares for a child in what seems the right way, there should be no room for remorse, no matter what may be the outcome; for, in any given instance, or in all, no other action than the one taken would have been possible. "Train up a child in the way he should go; and when he is *old* he will not depart from it."

THE HOPE FARM WOMAN.

The Study Hour.

At seven p. m. or a little sooner, if outdoor chores and supper work are done in time, the bell is rung vigorously by Three-year-old to call the two older boys to the study hour. This is all the part the little fellow has in the work, as at seven sharp he is undressed and put to bed.

It is Seven-year-old's turn to read first to-night, and he gets the "Memory Gem" book and goes to work something after this fashion, in drawling monotone:

"Robert of Lincoln merrily s-w-i-n-g-i-n-g—"

"Swinging," prompts mother.

"Merrily swinging on brier and weed, near to the nest of his little dame, over the m-o-u-n-t-a-i-n- s-i-d-e. Mountainside."

"Over the mountainside and mead, Robert of Lincoln is telling his name, Bobolink, bobolink, Spink, spank, spink, Snug and safe is this nest of ours, Hidden among the Summer flowers. Chee, chee, chee!"

"Mamma, you read it over first," pleads the little boy.

So Mother reads it all and Father carries the littlest boy off to bed trilling happily an echo. "Bobolink bobolink, spink, spank, spink." After hearing the beautiful poem read understandingly, Seven-year-old wades through the rest of the verses very creditably and with evident enjoyment.

Now Big Brother takes his turn at the "Skeleton in Armor," which also has to be read to him before he can read it and get the "sense" of it. A short recitation in number-work for the younger lad comes next and then a bit of written geography work for the big boy. This only takes about half the hour usually, and if the work has all been done cheerfully and well, each has earned two pennies and besides the rest of the hour Mother reads aloud, which is counted a great treat.

Bedtime has always been at seven, until this year, and the reading has always been a part of the bedtime hour, but this Winter the school work has been added for the benefit principally of the older boy, who is backward in all but his number-work. It is easy to say in such a case "Why don't the parents help him at home?" But people generally do not realize that country children have a harder day than village children at school. They often walk a mile or two night and morning over bad roads in all sorts of weather, have only a cold lunch at noon, and besides help with the chores at home, being, when night comes, physically unfit for a strenuous hour or so of mental work, as indeed the parents are too. They are often dead tired with the long hours of hard labor which is the lot of most country folks. However a hot, hearty supper, soon after the children get home from school fits them for an hour of light mental work after the chores are done. After eight o'clock there still remains at least an hour for Father and Mother to enjoy, after the youngsters are safe in bed. If neighbors "drop in" or some social event calls the folks away from home, books are laid aside just for the evening. As for the reading matter there is always a book going; at present "John Halifax" just begun, and "Robinson Crusoe," just finished, while "David Copperfield," "The Little Lame Prince," "Heidi," "Dri and I" and others have had their turn. There is too, always a brief Bible reading, and the "Youth's Companion" and other papers and magazines furnish material for a varied program. F. J. F. F.

HAUNTED HOUSES.—Most people of middle age have heard stories of haunted houses. Many of them in fact have known buildings situated in lonely places which were thought to harbor ghosts. We have known several cases where ignorant or superstitious people absolutely refused to go by such houses at night, or to enter them and remain alone. A recent medical article gives an account of the investigation of such a haunted house. Reputable people who slept in it declared that they heard strange noises, and that they actually saw various shapes and shadows gliding about. A cold-blooded scientist who could not have possibly been frightened by a ghost, spent several nights in the house, both alone and in company with those who claimed it was haunted. He found that two or three stoves burning coal were not properly ventilated, and that the windows and doors had been kept shut tight. Thus there was an accumulation of coal gas in several of the rooms. The effect of this coal gas is peculiar upon some humans. Among other effects it disturbs the mental processes, makes them exceedingly nervous, and in a half-awake and half-asleep condition they frequently see visions and hear peculiar noises. The house was haunted by coal gas, and that was all. It was poorly ventilated, and poorly heated, and people of a naturally nervous temperament when sleeping in the house were affected by the gas and imagined a long series of vain things.

RAPID FIRE KITCHEN WORK.

Ham and!
Draw one in the dark!
Brown the wheats!
Sunny side up!
Put on two!
Two sinkers!

Every business will in time develop its own peculiar language. If you were in the habit of eating your dinner in one of the quick service restaurants in lower New York you would need no translation. Here is a crowded place where 1,000 people must be fed in an hour. They do not put their head in the door and ask if dinner is ready. They crowd right in and must be served at once or they go elsewhere. Walled into one little corner stands the cook. He can stand in his hot box and with scarcely moving reach a hot charcoal fire, an iron slab heated by gas, a great boiled ham, a chunk of boiled beef, and a great pan of hot baked beans. Now let us see what follows as a result of this clipped and condensed language.

"Ham and!" If you were in your kitchen at home you would say, "Mother, let me have some of those hot beans with a thick slice of boiled ham with plenty of the fat!" The cook makes a quick slash with his knife and off drops a slice of ham. The bone has been taken out. Another quick motion and he scrapes out a spoonful of beans and smears it on the plate. Almost before you could walk across your big kitchen to the stove and back the "ham and" has been eaten and paid for.

"Draw one in the dark!" Easy! That of course means a cup of coffee without any milk in it. There is a tank full of hot coffee always ready. A turn of the faucet and the cup is filled.

"Brown the wheats!" There is a pitcher of batter on a shelf. With a sweep the cook rubs a brush full of fat over the hot slab with the gas burning under it. Then he pours three 'round patches of batter on the slab. He knows just how much to pour. It is a wonder how quickly those patches brown on the under side and show bubbles on top. With a quick jerk of the broad knife they are flopped over and the wheat cakes are browned.

"Sunny side up!" The cook dives his hand into a dish of eggs. Another smear of fat on the hot slab and with a single quick smash each egg is broken and spread out to fry. Had he been ordered to "flop 'em" he would have turned them over for cooking, but "sunny side up" means that only one side is cooked. So he turns them out—little white rafts with the yolk red and natural on top.

"Put on two!" At the top of his shelf are a dozen or two wide-mouthed tin cans. Each holds perhaps a dozen small oysters, a quantity of milk, a lump of butter and salt and pepper. At his right are several metal dishes connected with steam pipes. Almost before you know it he has poured the contents of two cans into two of these dishes, turned a valve to let in the steam and two good oyster stews are nearly ready to serve piping hot.

"Two sinkers!" A sliding shelf comes out and there are 100 or more round pieces of flour dough slowly "rising." They are much like flour biscuit, only a quantity of yeast has been used with the baking powder. These when put on the hot slab grow thick and brown—more porous than biscuit—more like quick baked bread.

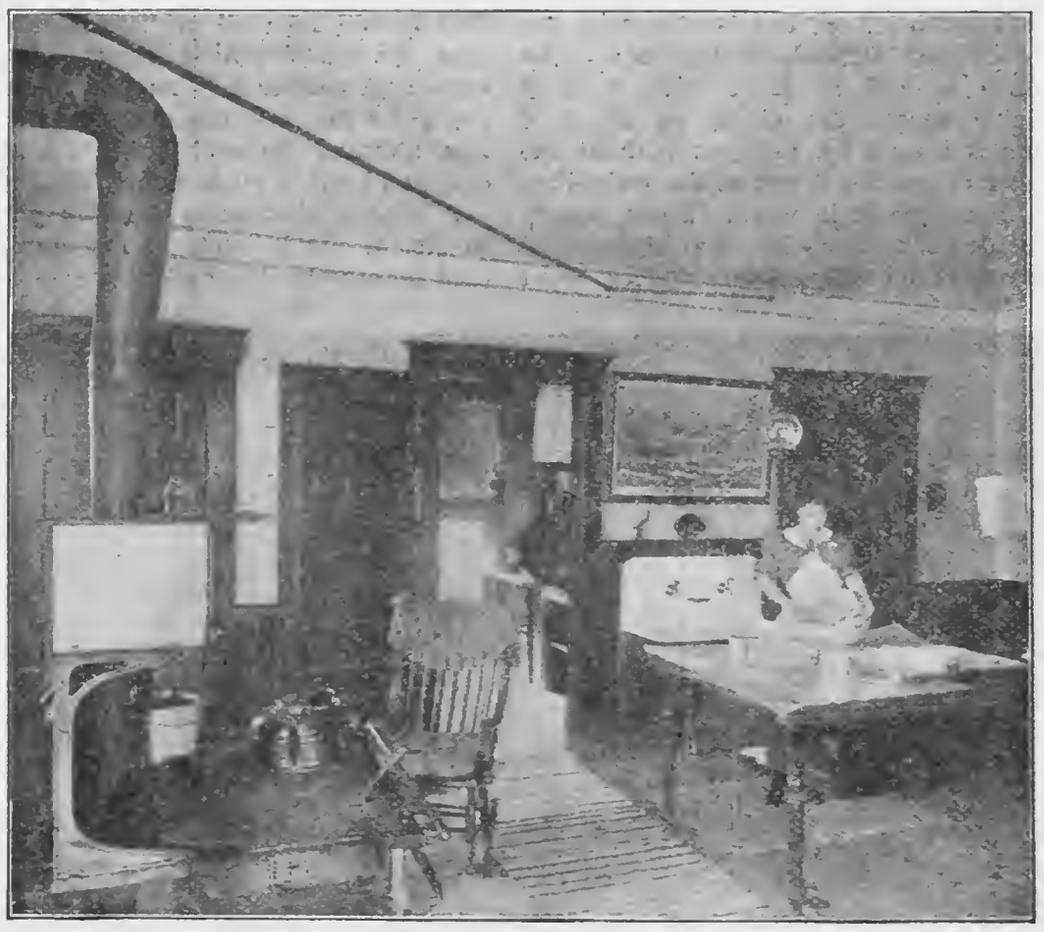
One who has never seen it done can hardly believe that good food can be turned out so rapidly. It *is* good, well cooked and clean and it is possible to do it because this cook has everything at his hand. The meats are cooked ahead in steam cookers, the "sinkers" and beans are prepared while trade is slack, and there is *always* a hot and constant fire. The pies are bought from a great wholesale pie baker.

Off in another obscure corner, close to the kitchen, stands a woman and boy washing dishes. What a job this is for a family of five. Think of washing for 2,500 people and not making such a disagreeable job of it either. The dishes are brought out in wooden trays. A boy rapidly scrapes off the "leavings" into a bucket. Then the dishes are put into a rack which fits down into a tank. A spray of kerosene or a dust of powder goes over them. A turn of the hand sets hot water and steam pouring upon them, and an electric motor sets the rack to churning up and down. Then the rack is lifted into another vat where clean water and steam are sprayed upon the dishes until they are more than sterilized. Then they go into a dry heat, a brief towel polish and they are ready for more "ham and" and "dark."

New York could not be fed at noon without this quick and efficient service which has developed this strange and picturesque language. No one wants the farm housewife to use this language and throw the food at father and the hired man, but she may well copy some of the time-savers which makes this cook efficient. The thing is to study out kitchen conveniences which are within reach and put them to use. Save kitchen time. You will have better food and more time for yourself.

FEWER KITCHEN MILES.

The average farm kitchen, in arrangement and in the number of conveniences for doing the work with the least effort, does not compare favorably with the average kitchen in town or city. Our contention is that there is no very good reason



ALL THE COMFORTS OF HOME.

why this should be true. On the average farm of the present day there is provided some way of watering the live stock without having to do the pumping by hand; but in the average farm kitchen, all water used has to be carried in by the pailful and all waste water carried out in the same manner. This does not seem to us a fair arrangement; and when we see a kitchen of this kind we cannot help wondering if a change would not soon be made if the farmer and his wife were to "change work" for a week or two.

From observation in a number of farm homes I am inclined to the belief that many kitchens are larger than they need be for the greatest comfort and convenience of the housewife. There is often too long a journey to be made between stove and work table or sink; and too many steps have to be taken between the sink where the dishes are washed and the cupboard where they are kept. Most housewives could learn a valuable lesson from the kitchen in a dining-car. In the old-fashioned kitchen which is used also as a dining-room a part of the year, there is some excuse for its being a large room; but the room which is to be used for a kitchen only, should be small enough so that the mistress may stand in the middle of it and reach range or sink or cupboard or flourbin without taking more than a step or two. Of course this means that there must be windows on at least two sides so that good ventilation may be provided in warm weather. This arrangement also means that there must be some place provided aside from the kitchen for the men to wash in and to keep their extra working clothes. This problem was nicely solved in one farm kitchen which the writer recently saw. The kitchen as originally built occupied the whole of a wing of the house, and was about 20 feet long by 18 feet wide. When it was decided to make a change, a partition was put through the whole length of the room so as to leave the kitchen a little less than 12 feet wide, and the other part was divided into two rooms, a washroom for the men and a bathroom. The washroom contains three porcelain-lined iron wash bowls and the bathroom the usual fixtures, tub, washbowl and seat. All these fixtures are connected with a sewer pipe which was laid below the frost line, and extends to the bank of a little stream nearly a quarter of a mile away. The supply of water for the washroom and bathroom is in a small tank in the attic over the kitchen. The water is pumped from the cistern to this tank by a little gasoline engine. I may add here that this same little engine also pumps all the water needed by the live stock on the place, runs the washing machine, wringer, ice cream freezer, fanning mill, feed grinder, wood saw and cement mixer. It is mounted on a little wagon, and a stout man can move it about easily. Every Monday morning it is taken to the house, where it is used to run the washing machine and wringer and to pump enough rain water from the cistern to the tank over the kitchen to last a week. The remainder of the week it is kept in the feed room, where it may be connected with the deep well pump or with feed mill or any of the other machinery.

In most farm homes an arrangement something like the one mentioned above could be provided, and nearly all of the work of installing such a system could be done by the farmer and his sons, provided they had some mechanical ability. Running water in the kitchen and a drain to carry off the waste water from the kitchen sink should at least be provided, and then the boiler for hot water, the bathtub and other fixtures could be added later. In many cases it may be difficult if not almost impossible to make a satisfactory rearrangement in an old house, as described above, but in the planning of a new farm home it seems to me that it would be a good plan to decide that the kitchen be used simply as a kitchen, and that the washroom, and if it can be afforded, the laundry, be entirely separate.

J. M. DREW.

MAPLE SUGAR A DESIRABLE SWEET.

To keep the body well adjusted and efficient, one needs to eat a certain amount of sugar, and there is no other manufactured that fills this want so completely, when taken with moderation and at the proper time, as maple sugar. Especially is this the case with growing children, when some sweet is absolutely necessary to keep the daily menus well balanced. The housekeeper, too, who must cater to the appetites of her household with the grocery store three or four miles away, or depend on the uncertain visits of the supply-man who calls at her door, is never at a loss for a substitute when her sugar runs low, if she has a goodly supply of maple sugar on hand; like her resourceful forebears she can turn, with equal satisfaction, to this pure wholesome home product for her sweetening. In fact, she finds the flavor of many of her desserts, as well as other dishes, greatly improved by its use. Among the recipes given here are some new preparations that are well worth testing.

Vermont maple waffles are delicious when served nicely buttered and piping hot. To make them, soften one cupful of finely shaved maple sugar in three cups of milk. Sift one quart of flour with three teaspoonfuls of baking-powder and one saltspoonful of salt, then rub in one tablespoonful of softened butter. Beat the yolks of four eggs until light, then add the milk and sugar, and stir gradually into the flour; beat thoroughly, fold in the whites of eggs beaten stiff and dry, and beat again. Bake in well-greased and heated waffle-irons.

Maple nut biscuits are especially nice served with fresh fruit, or for the children's school lunches. Chop one-half cupful of walnut meats, and mix with one cupful of finely shaved maple sugar; this will be more satisfactory if put through the meat chopper. Sift one quart of flour with four teaspoonfuls of baking-powder and a little salt three times, then add two tablespoonfuls of softened butter or lard, and sufficient sweet milk to make a soft dough. Turn out half the dough on a floured board; knead lightly and quickly; roll out in a thin sheet and cut with a small biscuit-cutter; brush over the top of each with a little milk or white of egg, and spread with a layer of the maple mixture. Roll out the remaining dough and cut out in the same manner; place one on each of the first, and stand the biscuit in a baking-pan, far enough apart that they do not touch during the baking. Brush the tops with white of egg, and bake twenty minutes in a quick oven. A small lump of maple sugar, or a perfect half of a nut meat may be added to the top of each if one likes.

Maple sugar rolls are tempting, particularly when served for breakfast with coffee. Make a biscuit dough in the same way as given above, and just before rolling out stir in one cupful of finely chopped maple sugar; roll out in a sheet about half an inch thick; cut out with the biscuit cutter and brush each with white of egg; make a crease through the center with the back of a knife, and fold one-half over the other. Brush the tops with the remaining white of egg, and bake in a quick oven. Serve warm or cold.

Baked apples are delicious served with currant jelly and maple sauce. Wipe and remove the cores from medium-sized tart apples, and fill the cavities with a spoonful of currant jelly. Put into a porcelain baking-dish, with one cupful of boiling water and bake in a quick oven, basting every few minutes. When perfectly tender remove from the oven, peel carefully and place on a serving dish. In the meantime, put one cupful of maple syrup and one-half cup of boiling water in a double boiler, and heat until boiling hot. Rub one tablespoonful of cornstarch with two of softened butter, and add to the syrup. Cook five minutes, cool, and pour over and around the apples.

Maple junket is a dainty wholesome dessert. Slightly sweeten and warm one quart of milk, using either maple sugar or syrup. Dissolve one junket tablet in one tablespoonful of cold water, then add to the warm milk. Pour into glass serving-dishes, and when firm, set in the ice-box and chill. Chop one-half cup of maple sugar and one-half cup of nut meats together, and when ready to serve the junket, spread a layer on top of each dish.

Most children love maple sandwiches, particularly if they are made in this way. Put one cupful of shaved maple sugar through the meat-chopper with one cupful of peanuts, then mix to a paste with thick sweet cream, and spread on slices of graham or brown bread.

Did you ever make a chocolate cake with maple sugar? If not, try this recipe: Put one-fourth cake of chocolate, the beaten yolk of one egg, one-half cupful of maple sugar, and one-half cup of milk into the double boiler, and cook until smooth, then cool. Cream one cup of crushed and sifted maple sugar with one-half cup of butter, then add two well beaten eggs, one-half cup of milk, with one teaspoonful of soda dissolved in it, one teaspoonful of vanilla, two cup-

Transformation Garnitures.

The woman who always aspires to appear well-dressed, cannot have too many accessories, as the latter will conceal the deficiencies of an old frock and give it the stamp of a smart up-to-date garment. Personally I long ago decided that the

1. Chemisette guimpe of net, edged with Irish lace at the top. The lace collar is fastened to the waist.

best-dressed woman is not the one who possesses many gowns, but rather she who has one gown or so with numerous accessories to change its appearance for different occasions. This secret I learned from the most stylish woman I have ever known.

Although an American, "Mademoiselle" has lived in Paris for many years, making fashion drawings for one of New York's big papers. On her first trip home we all thought her recklessly extravagant, for apparently she wore a different frock at every appearance. But she really did nothing of the sort, for as a matter of fact, she had but one good black tailored broadcloth suit, with a smart cut-away coat, and a dinner gown or two, as I discovered when I was given a peep at her steamer trunk. To my amazement I saw nothing but accessories, pile upon pile, all of which I learned in due time had been fashioned by the deft fingers of Mademoiselle herself from bits of left-over laces and lingerie. It was a revelation to us really extravagant ones.

There were transformation tunics or over-dresses—a black silk one cut long on one side and short on the other, with two full frilly ruffles, one on the edge, and one set above it on the tunic itself, which had a crisp black silk blouse finished with a wide green silk sash and a butterfly bow in the back, with cuffs of the green also; there was a black and mauve plaid transformation, a separate affair also, cut on the bias straight all round the bottom, box plaited and with an upstanding frill; then there was the smartest straight gathered tunic of black satin, the bottom wired in order to give it a little flare, and edged with skunk fur banding. With the latter was worn the most fascinating little black satin bolero imaginable, edged with skunk banding also. It was sleeveless and was worn over a white net guimpe, edged with frilly net ruffles. Last, but not least among the tunics, there was a black lace one made from an old-fashioned Spanish scarf bequeathed to her by Great-aunt Mehitabel. It was not even necessary to cut the lace, for it was cleverly draped, so it hung straight in the front and back, with long points at the sides. A touch of black Spanish lace on a low cut crepe de chine blouse, gave her a handsome dinner gown.

While on the subject of tunics and overdress arrangements, I wish to emphasize the value of this particular accessory as an aid to bringing last year's gown up-to-date. While it may not be becoming to the very stout woman, the slender one will welcome it as a most convenient and attractive accessory. Pliable wire and a featherbone cord that comes especially for the purpose, and which are sold at the notion counters in all department stores, will be found useful in giving the not too extreme lampshade flare now considered fashionable.

An old silk gown that has seen its best days and which has too little good material left to remodel it, may be utilized for such a transformation. Patterns for the latter may be ordered through THE RURAL NEW-YORKER'S regular pattern service. No. 8087, shown on page 18, is particularly well adapted for the purpose, as this one pattern will serve for numerous variations of the tunic idea.

Even the most conservative woman must admit that she is delighted over the fashion which calls for an unconfined neck dressing in lieu of the former high-necked style. No one stops to consider whether the neck itself is thin or plump nowadays, as there is really but one style of neck garniture—the low with its many changes. The nearest approach to the high style is the net guimpe with its high collar, which is preferred by many women for street wear; for even though the net is transparent, there is a feeling that the neck is not so much exposed to the gaze of the public. This accessory must be as faultlessly fitted as a blouse, however, and have a high, snug collar edged with narrow Irish beading to give the correct finish. Any woman can easily make these guimpes (of which there should be a goodly supply for the sake of an immaculate appearance) cutting over an ordinary blouse pattern, hemming at the waistline and running elastic through the hem. The superiority of the elastic over the old-fashioned method, is apparent. The guimpe is held in place with never a wrinkle across the chest, as all good guimpes should be, and yet without the danger of pulling it out at the waist-line, the first time it is worn. Some women who do not care for the high-necked guimpe under any circumstances, omit the collar, and after the guimpe is fitted add as a finishing touch a smart upstanding frill of plaited net. When worn under the blouse only the front of the guimpe is permitted to show with its frill falling gracefully over the edge of the waist. In other words, it was formerly the custom to trim the blouse with net yokes, cuffs, etcetera. When new and fresh, the waist was certainly a joy, but the moment it began to soil and look dingy, the wearer appeared dowdy. To attempt to cleanse the lace usually played havoc with it unless it was entirely removed. This meant "making over." That is one reason why there is such a vogue for the separate neck garniture.

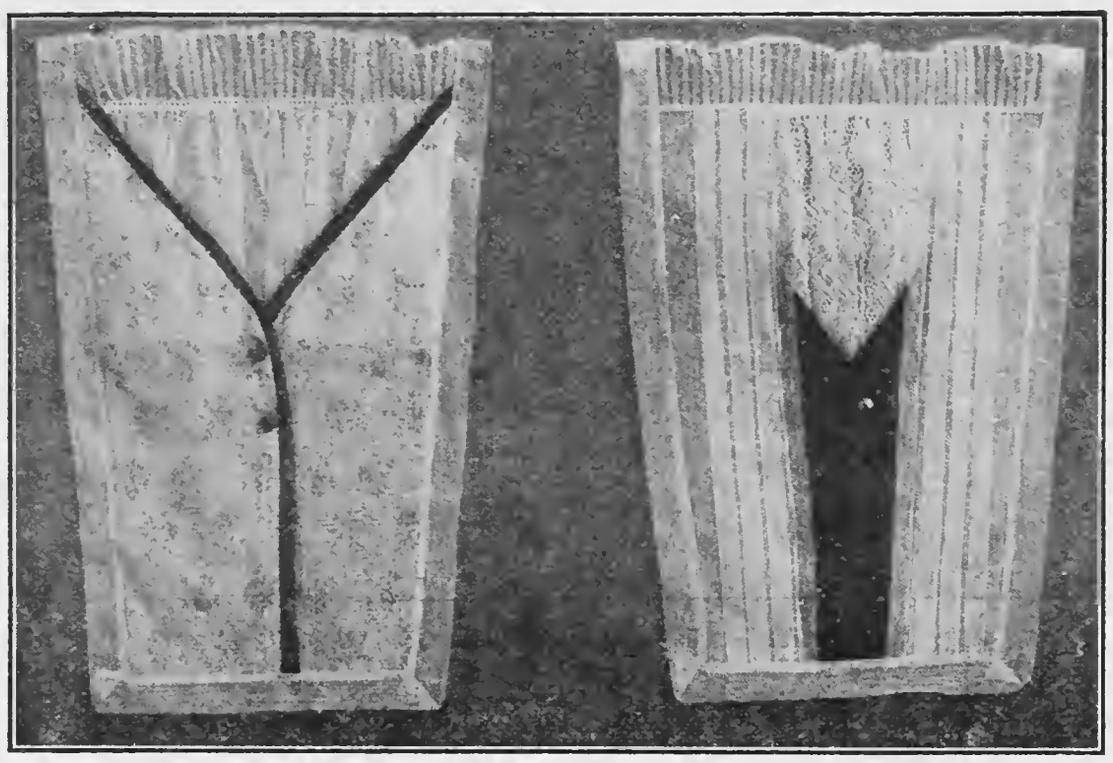
There is romance and history in the present-day accessory, particularly neck garniture. We may select neck fixings such as were worn by one or several of our favorite heroines in historical fiction, and have the serene satisfaction of being in the mode as well as reviving the memory of such personages as Marie Antoinette, Mary Stuart, Catherine de Medici, Charlotte Corday, Queen Elizabeth and others of the gallery of women of a past age. The rage for the dainty ruff, upstanding frills, fichus and surplices is due, no doubt, to the vogue of the semi-diaphanous blouse, and the fashion of the decolleté neck for day as well as evening wear.

The fashionable need is forecast in the sleeveless bolero mentioned in the foregoing, in the Eton jacket, the sleeve-finished waistcoat guimpes, and the Tuxedo outline of the smart frocks that require the soft "filling" offered by the chemisette-fichus such as are pictured. Many of the very newest gowns are so made that the wide deep front is left without any trimming in order to give an opportunity for these transformation vestees and chemisette-fichus, according to the personal taste and inclination of the wearer.

The lightly wired upstanding frill of lace, a la Medici, is the newest type of neck garniture. The back of the collar is wired, high and straight around, gradually sloping down toward the front where the throat is left bare above the crossed folds of fine net. A black velvet band is worn around the neck with this style of neck garniture, by the woman who would appear individual. Indeed, there is a quaint reminiscence of the old "Books of Beauty" and "Keepsakes," in the new neckbands of narrow velvet, with their prim back bow fastening, or with their side closing under clusters of silken or satin ribbon rosebud or forget-me-nots. There is something about them even more essentially feminine than can be claimed for any circlet of jewels. Little jewelled slides and buckles such as our grandmas used, may be utilized, but they are more appropriate for older women than the flower closing. One caution should be observed. A little scrap of the velvet should be tested and the wearer assured that it will not soil or "crock" the fair skin against which it clings. This is especially necessary where one perspires easily, as the moisture may cause a dark line, staining the neck under the accessory, and leaving an unsightly rim.

A simple chemisette fichu is pictured in No. 1. It is made of fine net, gathered across the top and bottom—the top finished with Irish lace. A frill of plaited lace is secured loosely to the blouse, so it may be removed easily for cleansing or renewing. Two yards of lace for plaiting, or one yard of plaited lace are required for this neck garniture. For the chemisette, one half yard of net will be sufficient for three or four guimpes. Another form of chemisette guimpe is pictured in No. 2. These may appear flat and uninteresting off the figure, but they are smart and modish when worn as on the figure in No. 1. One of these is made of flowered net—the latter white with a rosebud pattern, and edged with old rose satin binding and buttons. This gives the waistcoat effect, over the chemisette of plain white net, finished with a net ruffle inset with net beading. The other chemisette, with shirt-bosom plaiting has a black satin vest effect. A single baroque pearl button simulates a closing. The chemisette is of lace fulled in place. The net frill may be worn very high, if desired. These chemisettes may be varied to suit individual taste and requirements—incidentally to conform to the contents of the ever-resourceful scrap bag.

What "rag-bag" cannot yield enough left-over material to at least furnish a portion of the net, lace or satin bindings for such accessories? Even the smart little bow tie shown at the bottom of illustration No. 3 is made from left over bits. A coarse mesh white linen, a knot of blue velvet, and a little handiwork made the tie a beautiful possession. The tab ends were pointed and buttonholed with blue embroidery silk. The rose is pink a la Pompadour, which is nothing but simple stitchery, commencing in the center and working toward you, with three shades of mercerized cotton. The leaves and buds are in lazy-daisy stitch. Aside from the hour's time to embroider and buttonhole stitch the ends, the tie cost nothing.



2. Chemisette vestees of net—figured and plain, with satin garniture, and upstanding lace or net ruches.

The net fichu is made of a rather open-meshed net, so the buttonholed edges would not fray out before they were worked. Only cut one scallop at a time, in order to obviate this. Work with white mercerized floss. The dots are in satin stitch—over and over, filling the small circle. The floral design is worked in satin stitch also. This fichu is seamed on the shoulder in order to make it fit—French-seamed to insure a neat finish, of course. There is a shallow sailor collar effect in the back. A single frill of bought plaited net finishes the fichu proper. A double upstanding frill high in the back and sloping toward the front finishes the throat dressing. One of the daintiest fichus imaginable may be made exactly as pictured, buttonholing with pink mercerized floss, and embroidering tiny Pompadour roses and leaves in pink and green, the same as on the tie.

Little waistcoats of brocaded silk and satin are now classed among the indispensable fixings of the up-to-date wardrobe. They are worn with little wrinkles or creases across the waist, very like the masculine garment, to accentuate the lines of the uncorseted figure.

LOUISE E. DEW.

A Song in Exile.

O they that leave their father's land, new friends and homes to find them,
They turn their faces to the sea, but leave their hearts behind them.
Their hearts lie buried in the fields, along the blackthorn hedges,
Beside the brooks where rushes cool crowd close about the edges,
They're rooted in the holy soil, the green soil, of the sireland,
Who turn their faces to the West must leave their hearts in Ireland.

The West is wide and rich and free, a grand land—but a cold land.
I hunger for the warmth of love that's found but in the old land,
I hunger for the linnet's song across the sunlit spaces,
I want the sights and sounds of home, the dear familiar faces,
At twilight how the heart stirs—when the angelus is calling,
And on the misty Irish fields the silver dew is falling!

Asthore machree! The sea's between, and foreign skies are o'er me,
But in the night I feel my heart throb in the land that bore me,
I feel it beating strong beneath the shamrocks and the mosses,
It clings about my people's bones beneath the Irish crosses,
It calls and calls across the sea, to come home to the sireland,
The haunted hills, the singing winds, the smiling skies of Ireland.
—Marie Conway Oemler, in the Outlook.

LET us with caution indulge in the supposition that morality can be maintained without religion * * * Reason and

experience doth forbid us to expect that National morality can prevail in exclusion of religious principles.—Washington's Farewell Address.

MAPLE SUGAR A DESIRABLE SWEET.

(*Continued from page 87.*)

fuls of sifted flour, and the chocolate mixture, and bake in layers. For the filling and top, cook two cups of maple syrup with a speck of cream of tartar, without stirring, until it spins a thread, then cool and pour slowing on the beaten whites of two eggs, and beat until stiff enough to spread.

For a delicious maple ice-cream, heat in the double boiler one quart of rich sweet milk until boiling hot. Mix one-half cup of maple sugar with two tablespoonfuls of cornstarch, a speck of salt, and one-half cup of milk, then add gradually to the hot milk, and cook ten minutes, stirring often. Beat three eggs until light, and pour the hot mixture over them, return to the fire and cook until the eggs are set; remove from the fire and cool. When cold add one pint of cream whipped stiff, and one cup of thick maple syrup. Turn into a freezer and freeze.

ROSAMOND LAMPMAN.

PIN MONEY FROM FLOWERS.

It is sometimes a bit of a problem for the woman and the children on the small farm to earn a little extra spending money. Of course there is the old standby, the chickens, but sometimes these do not do their full duty, or there is need for more money than the chickens yield. During one of the "hard times" periods of quite a number of years back, while I was a youngster, my mother and I went into partnership to earn a little extra money. I wanted to visit a friend in Madison, 40 miles away, but lacked the carfare, and mother always could find use for an extra dollar or so. A lady visitor suggested that we might be able to sell flowers at Devil's Lake, a Summer resort four miles away. We had quantities of pansies, sweet peas and Asters, as well as other flowers, so we decided to try the plan. Mother picked and bunched the flowers the afternoon before, and I would take them over and sell them to the guests at the hotel and those living in the cottages around the lake. Sweet peas sold the best, and 20 or 25 stems were tied in a bunch. Six or seven Asters made a nice-sized bunch and were popular also. Two or three leaves of rose-scented geraniums tied in with a dozen or 15 pansies sold quite readily. While we had other kinds of flowers these three sold the best. I received five cents each for the little bouquets. The Summer resort season is short, and we started rather late, but the first year we sold $12 worth. I made two trips a week and sold from 50 cents to $1.25 each trip. This does not seem so much now, but it was a good deal then, when money was scarce. I had enough to make my visit and some left over towards buying a new suit of clothes out of my half of the $12. The next two years we sold nearly $20 each year. After that I had grown large enough so that my time was worth more to work at home. I was always rather timid about offering my flowers, and I have no doubt I could have sold more if I had been more forward.

Of course there is not always a Summer resort available, but usually some market can be found if searched for. If near a fair-sized town, arrangements can probably be made to have them sold at a grocery store, allowing the grocer a commission of a cent a bunch for those that he sells. It may take two or three years before people buy very readily, but it will be surprising how much may be sold when people know fresh flowers are always to be had during the Summer months. The grocer may feel that the profits are not large enough to be worth bothering with, but he can be reminded that a chance customer, attracted by the flowers, may become a permanent buyer of groceries later. This argument, together with the fact that there is no risk of loss, will usually attract favorable attention. A 10-cent store or a popular drygoods store might also be good places to try. In a small town or village where there is no regular florist some business may be done furnishing flowers for funerals or other occasions if people are informed that flowers are for sale. In the smaller places people are so used to having flowers given to them it may be a little slow to get them into the notion of paying out good money for flowers, but if one has good taste in arranging the money will come in time.

For the Summer resort trade probably pansies, Asters and sweet peas, with possibly daisies and bachelor's buttons are enough to grow. For very early Spring flowers pansy seed should be sown in August and the young plants wintered over with a little protection of coarse hay. Quite early flowers may be had from young pansy plants that have been started in the house or hotbed the latter part of the Winter. For Summer and Fall flowers the best results will be had from seed sown outdoors as soon as the ground can be worked in the Spring. Pansies bloom best during the cooler weather of Spring and Fall.

For very early flowers, Asters should be sown in hotbeds, but for a general crop and for later flowers the seed can be sown during April and transplanted to their regular quarters as soon as large enough. The Queen of the Market is a very satisfactory variety of Aster for early cut flowers. The Giant Comet and Ostrich Feather varieties are later flowering and many like the long-petalled feather flowers of this class. These, as well as the Queen of the Market variety, may be had in a variety of colors. The Crego Pink is another very beautiful kind of the feathery class. The Branching varieties of Asters are very useful for cutting, as the stems are long and the flowers large, with beautiful incurving petals.

Sweet peas should be sown early to succeed best. More of the pink and white colors will be needed than any others. When bunching either sweet peas or Asters, a little taste must be used in combining the colors if bunches of mixed colors are made up. The pinks and purples mixed together are especially displeasing.

If the flowers are to be sold through grocery stores or direct from the garden a succession of flowers must be planned for from Spring to Fall. The heaviest sales will be made during Spring and early Summer and in the Fall. For early Spring the tulips, Narcissus, and Iris will give a variety and later will follow peonies, daisies, Iceland poppies, Canterbury bells, oriental poppies, roses, bachelor's buttons, larkspurs, Gaillardias, Coreopsis, Pyrethrums, Golden Glow and other varieties. Of course the bulbs will have to be bought, and also the roots for a start of Iris and peonies, and the roses, but almost all the others may be raised from seed. It is not necessary to have all of these the first year, but the collection may be added to from year to year as the demand for cut flowers grows.

The county fairs often offer a good opportunity to make money from flowers. At many of the fairs there is not much competition in the flower department, and a showing of well-grown flowers is almost sure to take several premiums. If possible, flowers should be cut the afternoon or evening before being used or sold and the stems placed well down into water and set overnight in the cellar or other cool place. During the night the flower stems fill up with water and they will keep much better after being sold than if put into a warm room as soon as picked.

IN BOOKLAND

I. Freedom, Dwell With Knowledge; I Abide With Men by Culture Trained and Fortified.

The best book-readers live in the country. During the long, quiet Winter evenings there is time to read a book without interruptions, and the reader may get the full spirit of the author. The really strong books are those which induce thought. The great author leaves the best of his message unprinted. It lies between the lines, and the reader must think it out in his own way. There are too many "skimmers" who dash through book after book for recreation, or merely to occupy the time. A woman once told us that she had nothing left to read—having run through every book in the neighborhood. It was found that she could give only the merest details regarding some of the strongest books she had "read." When she came to something which required thought she skipped it in order to "go on with the story." Country people as a rule have access to fewer books than town people can reach. That is why the good book in the country is studied and pondered over, while amid the distractions of the town it would be merely skimmed through.

For true thinking is hard work. It must be hard for through it the man must run the gauntlet to knowledge. No nation ever fought its way to permanent freedom with the sword alone. Men can be free only through knowledge. That is why we would discourage the reading of what we call fool or foul books. The fool book may tickle or please the mind for a moment, but it does not make the reader *think*—which is the true end of reading. The continued reading of fool and foul books leaves the mind incapable of clear thought or reasoning. We have a friend who considers Tolstoi's "Ivan The Fool" the most thoughtful satire on modern government that ever was written. Yet we gave that to another friend and he pronounced it the most stupid, childish thing he ever tried to read. "Nothing in it." One man got the vision and meaning which the author put between the lines. The other could not get back of the printed word. So when we ask our readers to name their useful books we mean the volumes which have given them a mental struggle and taken them away from themselves. To put it another way, a book should be a tool and not a plaything. There are all sorts of tools. Some of us have come to the point (or remained there) where we can only think of a tool as something we can take in the hand and use for manual labor. Does not everyone know that the mind directs the hand and the tool which it may handle? A mental tool therefore may mean better work and more work if it will make the mind broader and quicker. The value of a book all comes back to its ability to make the reader *think*. It may give him *facts*, but unless it can in some way make him think and reason from those facts they are dead. We know a practical man who says he reads the old "Confessions of St. Augustine" over every year! Here is a mental tool which 1,500 years cannot dull or discard. Yet our friend says he is a better farmer and a better citizen from the undying thought which this old book gives him. Friends tell him that a modern discussion, perhaps like "The Inside of the Cup," would be more "up-to-date," but he sticks to the old "Confessions."

A book which has made me think hard is "Newest England," by H. D. Lloyd. This is a new series of essays on the social and political conditions in Australia and New Zealand. It is evidently written by a man who started out to prove his theories if possible, yet the statements have never been controverted. Without question the individual which we call "the common man" has a fairer chance in New Zealand than in this country. It is easier to acquire land and work it, and harder to monopolize on a special privilege. I can easily see that our conditions are vastly different and that we could not put into practice some of the things which have become fixed in New Zealand. Yet I am sure that the present upset and turmoil in politics with us is caused by the plain instinct of the common people shaking itself to demand what "Newest England" has long enjoyed. If 50,000 farmers in New York State could read this book slowly until they understood every word of it, Albany would be shaken up from the bottom. J. H. J.

There are as many ways to tell about books as to introduce people; the most frequent is the short notice, like the hasty introduction of a waiting line at a public reception. Then there is the longer and more pompous "review,"

SPRING WILL SOON BE HERE.

which is the "We have with us this evening" of the toastmaster introducing the prominent citizen. But once in a while some friend of yours will say that he has a friend whom he would like to have you know, and he wants to tell you about him first, and that is the sort of talk about friends—or books—that is worth while.

The young people from nine to ninety among THE R. N.-Y. readers will be glad to know Dan and Una and Puck. The children didn't mean to call Puck out of his Hill, but he came, Mr. Kipling tells

FUN AT RECESS.

us, in "Puck of Pook's Hill," and "Rewards and Fairies," and took away their Doubt and Fear and gave them "seizen" of Old England. And then—out on the rolling Downs deep in the oak woods, and even in their own meadow there came to them the shadows of those who had lived. Of course the tales mean more to English children, but we are so near akin that if we can sing:

"Land of our Birth, our faith, our pride,
For whose dear sake our fathers died;
O Motherland, we pledge to thee,
Head, heart and hand through the years to be!"

we will be glad to know Dan and Una and the friends they met. And some older folks, city-bound for years, will think of the home town as it used to be on Summer evenings and find themselves softly saying:

"Oh hop vine yellow and wood smoke blue!
I reckon you'll keep me middling true."

F. D. C.

The home feeling carried out in an orchard—an immense orchard in Indiana, planted with apple trees, with two rows of peach trees around the sides, which in bloom make it look like a great soft, pinkish, white blanket, with a deep pink border, spread lightly on the green earth—would alone promise a book of more than ordinary interest, and offer an assurance that the man who would plan such an orchard, spending hours looking over that particular stretch of land, was more than an ordinary character. It would, too, assure you that his family of 11 children would not move and think in ordinary channels. In "Laddie," by Gene Stratton Porter, we have such a family. The story is told by Little Sister, and she relates the everyday home happenings and it is full of fairylike fancies and stirring interest, including two weddings in the same church at the same time, not to mention those which go before. Little Sister's unfailing love for Laddie and her belief in the fairies, helps in the happy denouement of his courtship of the "Princess," and the reconciliation of the respective fathers. The bright childish philosophy which Little Sister brings to bear on these homely everyday occurrences, with the apropos quotations from McGuffey's Sixth Reader, gives you the feeling that you are living the life with them—life with a clean, wholesome, interesting family. Their joys and sorrows are yours and the excitement rippling through will cause you to close the book longing for more. Their love for outdoors is so invigorating you wish to take your hat and go out too.

M. G. K.

The Left Hand.

On page 1350, in speaking of left-handed children, the Hope Farm man thinks this is caused by differences in the lobes of the brain. We know to a certainty that the muscles of the right side of the body are controlled by brain elements in the left side of the cranium, while the muscles of the left side of the body are controlled by brain elements in the right side of the cranium. So accurately have post mortems and surgical operations following attacks of paralysis disclosed the seat of the trouble causing the paralysis, that by studying the organs paralyzed we can tell with almost absolute certainty just where in the brain the blood clot may be found in any given case. If a man gets a blow directly on the top of the head of sufficient force, his legs will be for the time being at least paralyzed, so that if a man is stricken with paralysis of the legs we know that the blood clot will be found in the top region of the brain. By the same tests we know if an arm is paralyzed the blood clot lies farther down toward the region of the ear. Still farther down we find the areas that successively control the mouth, the lips, throat and tongue. If the paralysis is on the right side of the body we know that the blood clot is in the left brain, whatever the region may be. Conversely if the paralysis on the left side of the body the blood clot will be found in right brain.

From the foregoing facts it seems that the motor forces of the body are originated in either or both sides of the brain. But not so the intellectual faculties. Just below the region of the brain that controls the tongue we find what is known as Broca's convolution, which is not much larger than a pea. It has been demonstrated that this little body is the sole center of articulate speech. It seems to control directly the muscles of the tongue, mouth, throat and lips. Hence an injury to that little organ renders speech more or less impossible. Now there is a close relation existing between speech and gesture, and as that part of the brain which controls the arms and hands lies next to the brain that controls speech, there seems to be good reason for the use of gesture as an aid to speech. It is true at least that an effective use of gesture in a set speech helps greatly to impress an audience

Now note this fact, that in the right-handed the speech center is always in the left brain, and not in both, while in the left-handed it is always in the right brain. It is true there is a Broca's convolution in both the right and left brains, but only one is used. However, if the convolution on one side is damaged in youth it is possible for the individual slowly to learn to talk. But if the damage occurs in middle life or after that, speech is rarely regained, even though the individual seemingly recovers in other respects.

Now what has right-handedness to do with this nobody knows. I am inclined to believe that in some way it is a hereditary trait that most people are right-handed, but not because one lobe of the brain is larger than the other. I have never read in any authority that the left lobe of Broca's convolution is larger in the right-handed than in the left. Dr. W. Hanna Thomson of New York City, an eminent authority, has written a small book which he has very appropriately called "Brain and Personality" in which this whole thing is more completely thrashed out than in any other book, I believe, in existence. He sums up his discussion of right-handedness and left-handedness by saying, "as the right hand is the oftenest used for every purpose, it is of the two hands oftenest used for gesture, which means of course for language. As soon as other parts were sought for to coöperate with gesture in language, the appeal would necessarily be to the neighboring centers in the left brain. It would not be long therefore, before the habit became settled to use only parts in the left brain for this specialized work, until finally the habit became fixed for life." Why some people are left-handed we do not know. This discussion on right-handedness and left-handedness comes down to us from ancient times, and is ever renewed."

This book of Dr. Thomson's is, I think, an epoch-making book in the discussion of the brain and the person. He aims to show that there is an indwelling personality within every human body which uses the brain as an instrument. I do not see with his array of facts how his conclusions can be gainsaid. At any rate it is a book to be reckoned with, and should be read by every thinker, and it will make him realize that he "has another think coming." A. W. FOREMAN.

Illinois.

The Wail of the Well.

Johnny Jones has lost a leg,
Fanny's deaf and dumb,
Marie has epileptic fits,
Tom's eyes are on the bum.
Sadie stutters when she talks,
Mabel has T. B.,
Morris is a splendid case of imbecility.
Billy Brown's a truant,
And Harold is a thief,
Teddy's parents gave him dope
And so he came to grief.
Gwendolin's a millionaire,
Jerald is a fool,
So every one of these darned kids
Goes to a special school.
They've specially nice teachers,
And special things to wear,
And special time to play in,
And a special kind of air;
They've special lunches, right in school,
While I—it makes me wild!
I haven't any specialties,
I'm just a normal child.

—May Ayres, in The American School Board Journal.

Live Stock and Dairy

The Scrub Cow Problem.

I have read with interest the views expressed by your correspondents in relation to improvement of our dairy animals, but judged from the standpoint of my own limited experience none of these writers have fairly struck the keynote of success.

First let us note briefly existing conditions. A vast majority of our dairy cattle are scrubs. My definition of a scrub is an inferior dairy animal. If this definition is correct, a majority of our registered cattle are scrubs, for a majority of these cattle are certainly inferior dairy animals. I believe this lamentable fact is the result of bad treatment of these cattle; that they are living illustrations of how quickly men with no knowledge of the correct principles of breeding, feeding and care of dairy stock, can cause good dairy animals to degenerate into scrubs. Wherever a scrub herd is found, and they can be found very easily, a scrub dairyman is also usually found, for they go together as naturally as a deranged stomach and a headache.

A scrub herd cannot be improved until the dairyman is improved, and I know of no better way to do this than to excite his cupidity by convincing him of the greater profit which can be derived from good cows. If the "almighty dollar" will not cause him to sit up and take notice he is a hopeless case.

The improved dairyman can secure an improved herd in two ways. If he is wealthy he can buy one ready made, but this is expensive, for good dairy cattle do not have to go begging for a good price. If he is poor the best way is to improve his scrub herd by the use of purebred sires of the right sort. And now we come to what I regard as the most important thing in the business of cattle breeding, a thing which I have already alluded to as the keynote of success; the selection of the sire.

How shall we select this sire? Certainly not by buying a bull simply because he is a registered animal, for I have already noted the fact that most of these registered bulls which can be found so easily and bought so cheaply are scrubs, and the dairyman who places a bull of this sort at the head of his herd is doomed to failure from the start. I will give my method of selecting a bull. When I wish to buy a bull I look first of all for a cow, paradoxical as this may seem, and I look for just the sort of cow which I wish to breed from the bull which I buy, i. e., the very best cow I can find. Why? Because the dam gives her characteristics to her sons just as certainly as the sire gives his characteristics to his daughters. When I have found a cow that is individually satisfactory I examine her breeding. And here is where the value of the registered pedigree comes in, for it is a record of her ancestry. This pedigree must fairly bristle with great dairy preformances. If it lacks these I reject the cow as a "sport," an animal which, though good herself, will most likely lack prepotency, which is the power to transmit her good qualities to her offspring. If I find her pedigree crowded with great dairy animals I next examine critically what I will term the line of transmission in her pedigree. This line goes from the cow to her sire, and from this bull to his dam, and from this cow to her sire, and so on the further the better. If all the animals in this line are great dairy animals I look no further, for I have found the dam of the bull I wish to place at the head of my herd. Of course I want the sire of this bull to be good, but this is of secondary importance, for a cow bred like the dam of this bull will be so prepotent that she will have about the whole say as to what her sons shall be.

I buy the first individually good son of this cow which I find for sale. Of course I buy him as cheaply as I can, but I buy him, for he will be cheap at any price which I will have to pay.

And this leads us to consider what a dairyman can afford to pay for such a bull to grade up a herd of scrubs. Let us take a case in which this bull would be used to his full capacity. We will assume that he will be used on a herd of 50 scrub cows which average 200-pounds of butter each per year, for 10 years, and that he will sire 250 daughters which will average twice as much butter as their dams. And right here let me assure the doubting ones that there is nothing optimistic or visionary in this assumption, for such a bull can be depended upon to double the product of any scrub herd just as certainly as a good farmer can be depended upon to double the product from impoverished soil by a good system of fertilizing and culture. With butter at 35 cents per pound we will find the problem of this bull's actual value solved in this way: 250 daughters x 2,000 pounds butter x 35 cents per pound equals $175,000. It is impossible to say what such a bull can be bought for. One might be found in the hands of a small breeder which could be bought for $40 or $50. In the hands of a noted breeder he would probably be held at $1,000 or more. I have been lucky in finding two such bulls which cost me about $100 each.

The question which every dairyman must answer for himself is, can anyone afford to do business with a scrub herd when bulls of this sort can be found at any price within the bounds of reason.

New York. J. W. SHURTER.

GUERNSEY CATTLE NOTES.—At the recent National Dairy Show eight cows were selected to found demonstration herd to illustrate the correct principles of following and handling a dairy herd. Each cow was charged with the cost of food and credited with the amount of butterfat produced. The cows varied, from showing a loss of 75 cents during the week up to showing a profit of $4.14 for the same period. The cow showing the greatest profit was a grade Guernsey. She showed a profit of $4.14 for the week, or $1.02 more than any other cow in the herd. She also showed a favorable profit for the amount which was expended in food. She returned $2.77, or 53 cents more than any other cow in the herd. There have been many instances in the past which show the great value of the Guernsey bull in the improvement of the scrub cow, and the above is a most emphatic one. Aside from the fact of the return of a profit, the natural color and fine flavor so characteristic of the Guernsey product are also prominent in cows resulting from this line of breeding.

RIVAL BREEDS.—I heard a story the other day which I never saw in print, and as it is rather better than anything I have ever read I thought you might like to use it. Two prominent breeders were extolling the merit of their pet breed of cattle when they were approached by a city cousin, who said to them: "All cows are alike to me. What's the difference between a Jersey and a Holstein?" The Jersey man replied: "You take a silver dollar and put it in the bottom of a milk pail, then after you have milked the cow and can see the dollar through the full pail of milk, you will know it is a Holstein you have milked." The Holstein man said: "Take that dollar and put it in the bottom of another pail and after milking another cow, you find just enough milk in the pail to cover the dollar you will know then, you have milked a Jersey."

60 FRESH COWS, good size and well marked and in good condition; extra large producers. Come and see them milked. 40 COWS due to calf soon. They have the size and quality you like. Registered and grade Bulls always on hand. Bell Phone—14 F 5.

JOHN B. WEBSTER, Dept. Y, Cortland, N. Y.

Purebred Registered
HOLSTEIN CATTLE

Large sums are put into land, buildings, horses, machinery and labor in order to maintain cows that are utterly unable to return a profit.

On a dairy farm the efficiency of the herd should be the first consideration. With good purebred Holsteins you are sure to earn a generous profit on any intelligent investment of your money, time and labor.

After the cost of her feed is deducted a good Holstein will return a profit of $60 to $100 per year in addition to a valuable calf.

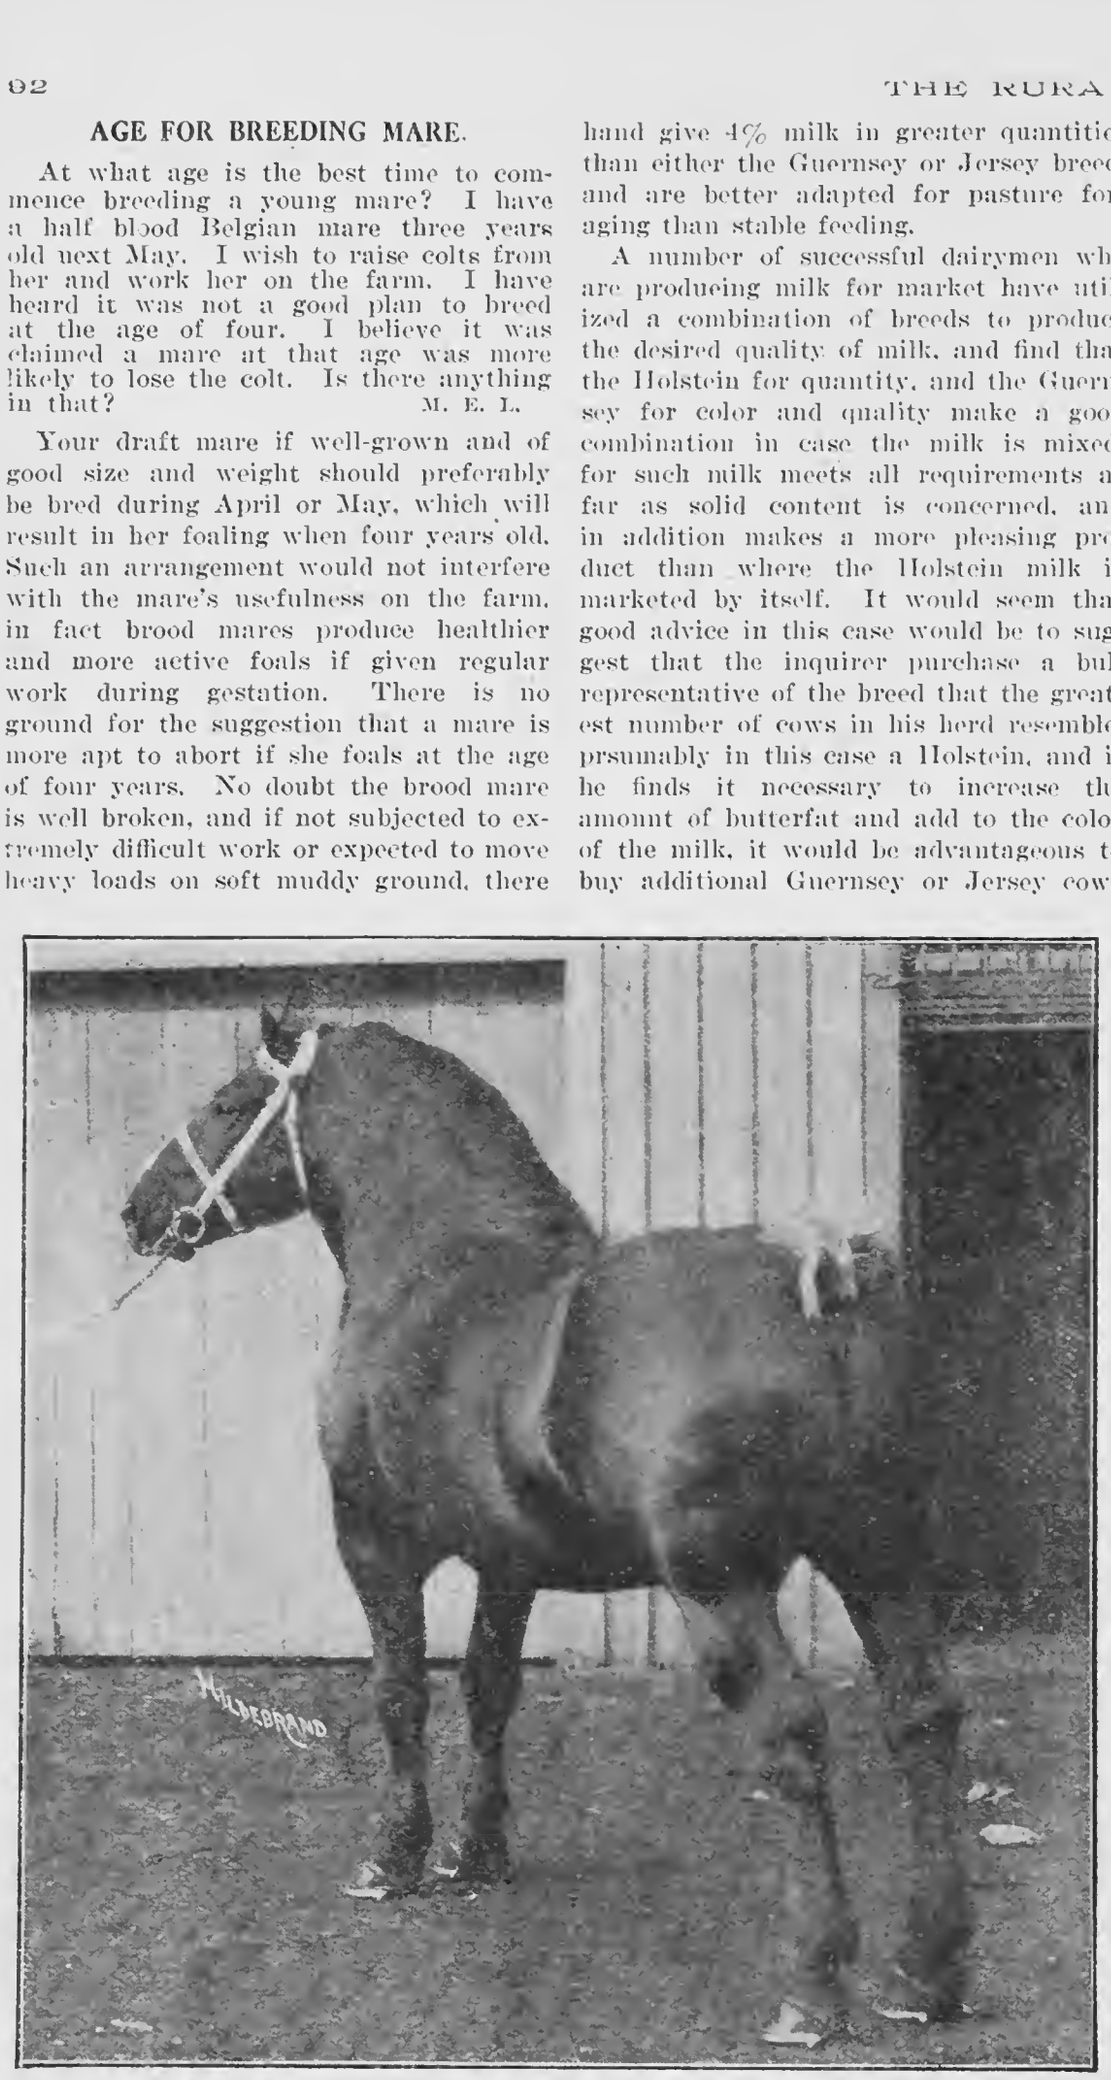
AGE FOR BREEDING MARE.

At what age is the best time to commence breeding a young mare? I have a half blood Belgian mare three years old next May. I wish to raise colts from her and work her on the farm. I have heard it was not a good plan to breed at the age of four. I believe it was claimed a mare at that age was more likely to lose the colt. Is there anything in that? M. E. L.

Your draft mare if well-grown and of good size and weight should preferably be bred during April or May, which will result in her foaling when four years old. Such an arrangement would not interfere with the mare's usefulness on the farm, in fact brood mares produce healthier and more active foals if given regular work during gestation. There is no ground for the suggestion that a mare is more apt to abort if she foals at the age of four years. No doubt the brood mare is well broken, and if not subjected to extremely difficult work or expected to move heavy loads on soft muddy ground, there



IMPORTED PERCHERON STALLION IDLEFONSE.

is no reason why she should not produce a strong, vigorous colt. In some instances, where a mare is heavy and well grown for her age, some breeders mate her so that she will produce a foal during the Fall when she is three years of age past, but it is much better under average conditions to grow the females well, and let them foal at the age of four years. F. C. MINKLER.

BREED FOR RETAIL MILK.

I am retailing milk, and have a good grade of milk with a good fat per cent. My cows are all good grade cows, but of different breeds. I have Holstein, Ayrshire, Guernsey and one Swiss cow, and I want to work up to purebreds. I am undecided as to which breed to give preference in purchasing a registered bull. I do not favor any one breed. I have seen big records for Holstein cows, bigger than any other breeds, but would the consumer like this milk as well as the Ayrshire milk? I keep my cows in barn Summer and Winter. Holstein being bigger cows, would they make as much profit deducting feed as the Ayrshire? Will you advise as to Holstein, Ayrshire and Guernsey, which to your opinion would be most economical and most satisfactory? P. J. C.

Danielson, Conn.

The important unit in milk production is the persistently high producing individual cow. We find such representatives in all breeds, and it is entirely a matter of selecting the individuals rather than relying on a breed's reputation to supply animals of the character desired. However, certain breeds have been developed for definite purposes, and it is conceded as far as quantity of milk is concerned that the Holsteins lead; as far as color is important, the Guernseys excel; while the butterfat can be obtained from representatives of the Jersey breed with great economy. The Ayrshires on the other hand give 4% milk in greater quantities than either the Guernsey or Jersey breed, and are better adapted for pasture foraging than stable feeding.

A number of successful dairymen who are produeing milk for market have utilized a combination of breeds to produce the desired quality of milk, and find that the Holstein for quantity, and the Guernsey for color and quality make a good combination in case the milk is mixed, for such milk meets all requirements as far as solid content is concerned, and in addition makes a more pleasing product than where the Holstein milk is marketed by itself. It would seem that good advice in this case would be to suggest that the inquirer purchase a bull representative of the breed that the greatest number of cows in his herd resemble, prsumably in this case a Holstein, and if he finds it necessary to increase the amount of butterfat and add to the color of the milk, it would be advantageous to buy additional Guernsey or Jersey cows rather than attempt producing them by cross breeding. The proportion of five Holstein grades to two Guernsey grades makes a nice product. Naturally a dairyman does not care to market 5% milk when 3% milk would serve the same purpose, for certainly it costs more to produce milk of a high testing quality than milk low in butterfat. The value, therefore, of a breed is to select individuals that produce the quality of product that is desired, and generally speaking selected individuals of the Holstein and Ayrshire breed would supply the quantity, while representatives of the Guernsey or Jersey breed would supply butterfat, color or quality at the least expense.

The important item to remember is that each individual in the herd should be there for a definite purpose, and that of furnishing a reasonable amount of milk or butterfat. It is the low-yielding, low-testing individual that takes the dollar from the dairyman's pocket, while it is the average high yielding individual that persistently from year to year milks in sufficient quantities to make her profit a positive fact rather than an indefinite presumption, that leaves the dollar in his pocket. The Holstein bull might be used to freshen the Guernsey cows, but the calves should not be raised. This arrangement would mean breeding the quantity cows and buying the color specimens. Ayrshires and Jerseys might also be used for the same purpose if preference suggests this combination.

BIG HORSES POPULAR.

At the International Live Stock Show, 1913, there was one class of Percheron stallions in which there were entered and shown 149 head. It was one of the greatest equine spectacles ever witnessed in this country. In this class a single Indiana breeder showed eight animals. There were other big classes of the heavy draft types, and some of the finest exhibits were in drivers and saddle horses. The whole seems to show that not only is there not any falling off in horse breeding and raising, but it is fairly galloping along. The exhibits this year came, in many instances, from farmers who are not breeders in a business sense, but are raising horses for their own use, with the surplus to sell. Seemingly the use of the automobile and motor truck has had but little if any effect on this branch of stock raising.

The greatest showing of Shetland ponies ever seen at an international show was made at Chicago at the show just closed. There were more Welsh ponies than formerly, and an immense interest was stirred up. Little people, almost entirely, are the cause of the great demand for this tiny stock—at least the children who have well-to-do and indulgent parents.

Idlefonse, the fine Percheron stallion shown in the picture opposite page, has had an unusual record in winning high awards. In 1911 he was third in his class at the International; in 1912 he was given second place, and in 1913 he was declared to be the finest specimen in the four-year-old class and the grand champion Percheron stallion at the show. He was imported, owned and shown by the Crouch's of Indiana. Big classes at this show was a predominating feature; in fact, they were too large for the biggest arena in Chicago to hold them.

Chicago. J. L. GRAFF.

REGISTRY QUESTIONS.

Would you call a bull calf, A. R. O. De Kol dam, and sire Korndyke Segis, grandson of King Segis, a good strain for milking qualities? I have a good dairy of grade Holstein cows and heifers, with as good a grade bull as I could buy. I am now going to buy a registered bull calf and would like to know if I bought one what would I have to do? I do not know one thing about registered stock. Would I have to join a breeders' association or something of the kind to have the papers? J. C. W.

Unionville, Pa.

The letters A. R. O. simply mean Advanced Registry Official, and are appropriately applied to dairy cows of pure breeding that have by performance met the requirements of breeders' associations that have fixed definite standards of milk or butterfat that are required of a cow to be either re-entered or placed on record that signify that they have been officially tested, and are recognized officially by the association, and their names placed on the A. R. O. lists. With certain registry associations bulls are recognized in the Advanced Registry if they have sired a stipulated number of daughters that have been entered and have met the requirements of the Advanced Registry Record Association regarding performances. Breeders often state that a bull is an A. R. O. bull, basing their statements upon the fact that the bull's dam was an A. R. O. cow. This is a false and misleading claim. Whether or not the bull referred to is an A. R. O. bull would depend upon whether he has sired daughters that are in the Advanced Registry themselves, and provided he has met the other requirements of the Holstein-Friesian Association of America. Such information could be obtained by writing to the secretary of the Holstein-Friesian Association, F. L. Houghton, Brattleboro, Vt.

It is not necessary to join any breeders' association in order to register purebred animals regularly. If a man is the owner of a large herd, and registers annually a large number of animals, it would be to his advantage to be a member of the particular breeders' association. All associations have two rates of registration, one for members and the other for non-members. If the inquirer is desirous of registering animals with the Holstein-Friesian Association he should first send to the secretary, requesting application blanks and other information giving definite instructions as to the procedure for appropriately identifying animals, and supplying the necessary information to meet the requirements of said association. F. C. M.

MATERIAL FOR BARN.

I intend to build a new barn 36x80. The intended new barn will have concrete basement, large windows on south and small ones on north, on account building the barn to the north against a bank. The upper part or second-story is intended to be only for hay; hip roof. I give list which one of my neighbors made up for me. Will you give me your advice if same is correct, or what has to be changed? Do you think the size of the roof in right proportion with the barn?

24 basement post, 10 feet long, 8x8 inch.
4 endsills, 20 feet long, 10x10 inch.
8 sidesills, 22 feet long, 10x10 inch.
4 corner posts, 15 feet long, 10x10 inch.
8 plates, 22 feet long, 8x10 inch.
8 plates, 22 feet long, 6x10 inch.
Sidepost, 10 feet long, 10x10 inch.
116 rafters, 10 feet long, 2x4 inch, bass wood.
116 rafters, 9 feet long, 2x4 inch, bass wood.
82 studdings, 14 feet long, 2x8 inch.
18 post, 14 feet long, 8x8 inch.
6 cross timber, 19 feet long, 8x8 inch.
14 sleepers, 20 feet long, 10x10 inch.
77 sleepers, 12 feet long, 2x8 inch.
8 girths, 19 feet long, 4x6 inch.
2,400 feet flooring, 1 inch thick.
3,040 feet roofing, 1 inch thick. E. J.

It would be impossible to build a barn of the size you mention from the bill of lumber submitted. To mention one or two defects in the bill, 10 and nine-foot rafters are specified for one side of a gambrel roof which is to cover a barn 36 feet wide; four such rafters, laid end to end, would span 36 feet, with one foot overhang at the eaves, only if the roof were absolutely flat. One-inch flooring is also specified, but barn floors should not be less than two inches in thickness. In a bill of lumber, sticks are not specified in the exact lengths which are to be used, but in certain standard lengths in which they must be bought, even though this involves some waste in cutting. You should make, or have made, a floor plan and sketch of the barn as you wish it built, and submit this to any competent carpenter and builder, who will then be able to make out a bill of lumber for the structure. M. B. D.

BRIGGS: "What! Are you going to Mawkser's funeral? I thought you made it a rule to associate only with superlatively happy people?" Griggs: "That's why I am going. You see, Mawkser left a lot of money to his relatives."—Life.

ONE of the numerous land agents of California was enumerating to a nurseryman the wonderful qualities of the land he was trying to sell. "On this land," he explained, "you could raise every crop you want in your business!" "Why," replied the nurseryman, "I know that place. You couldn't even raise an umbrella on that land."—Florists' Review.

For ANY Barn

A New Carrier For Both Rigid and Rod Track

JAMES 2-in-1 Carrier

Rigid and Rod Track Combined

A combination that offers all the advantages of the rigid track inside the barn—all the advantages of the rod track outside.

It enables you to use, inside the barn, the celebrated JAMES I-beam track, bent to any curve without use of heat, with JAMES simple switches and a raising and lowering carrier.

"Button-on" hangers make the I-beam track easy to erect.

Tub lowers by its own weight; is kept under perfect control by JAMES friction brake and clutch.

While filling tub carrier "stays put"—moves only when you push it, because track cannot sag.

Outside the barn you use the rod track. Stand at the door, give carrier a shove; it runs out, dumps itself at proper point, and returns automatically to the barn. *Never fails to dump.*

Cannot jump either the rigid or rod track.

We make carriers for rigid track—carriers for rod track—also this combination; all backed by the proved national success of JAMES Sanitary Cow Stalls, Stanchions, Pens, Ventilators, etc.

Get the facts before you invest a dollar in carriers.

$1.00 Puts It On Your Farm

THE CHATHAM Grain Grader and Cleaner

Handles 70 Kinds of Seed Grain and Grass Seed

From Wheat, it takes Wild Oats, Tame Oats, Cockle, Rye and Smut.

Cleans the dirtiest Flax. Has special knocker and skimmer which prevents clogging. (Other machines choke up.)

Takes Dodder, Barn Yard Grass and Foxtail out of Alfalfa and Millet "slick as a whistle."

Takes Buckhorn from Clover.

Sorts Corn for Drop Planter.

Famous BEAN MILL. Handles all varieties, takes out the SPLITS, Clay, Straw, etc.

Handles Peas as well as any Grain or Grass Seed. Removes foul weed seed and all shrunken, cracked and sickly grains. Takes out all dirt, dust and chaff. It is also a bully chaffer. Handles 60 bushels per hour. Gas power or hand power. Easiest running mill.

Manson Campbell

For $1.00, I Clean and Grade Your Seed Grain

You can't afford to plant common Seed (and take chances on a poor crop, when I am offering to scientifically clean and grade every bushel of your Seed Grain for this spring's planting for one paltry dollar.

Here's my proposition, and if you are a smart man you will write me before sunrise tomorrow:

Send me one dollar and I will ship you, FREIGHT PAID by MYSELF, this improved 1914 Chatham Grain Grader and Cleaner, with all equipment. Clean your Seed Wheat, Oats, Flax, Barley, Peas, Beans, Corn, Grass Seed, etc. Then PLANT those fine seed. AFTER you have harvested a bumper crop, pay me the balance of my low price. Not one penny need you pay, except the $1, until next October. And by October YOUR CHATHAM WILL HAVE MORE THAN PAID ITS ENTIRE COST IN INCREASED CROPS. Then you'll have it to work FREE for you the rest of your life.

Your Dollar Returned

I only want the dollar as evidence of good faith—to protect myself from mischievous boys. If after 30 days' hard test, you don't want my "Chatham," send it back at my expense and I will return the dollar.

A "Made-to-Order" Machine

Every "Chatham" is practically a *made-to-order* machine, for I send you the exact and proper Screens, Riddles, Hurdles and Sieves to grade and clean every *Grain and Grass Seed grown in your locality.* That's the secret of my success. I would not be the leading maker of Graders and Cleaners if I had tried to make my equipment fit ten million farms. What would you think of a clothing maker whose suits were all one size? Wouldn't it be a *miracle* if he gave you a fit. Yet all makers of Graders and Cleaners, except me, send the same equipment, whether you live in Maine, Ohio or Oregon. They wouldn't do that, if they had my 41 years' experience.

Extra Screens Free

I use, all together, 81 Screens and Sieves. It usually requires 15 to 17 for the average farm. These I select from the 81. After 41 years in the business, I am pretty sure to pick the exact equipment needed on your farm. If I shouldn't, just drop me a line and I'll send your additional requirements. There will be no charge for this.

Samples Graded Free

Maybe you have some Seed Grain that you can't clean or grade or separate. Send me a sample. I will purify it and tell you how you can do it cheaply. No charge for this.

Seed Corn Sorted

My big Corn Sorting Attachment, invented 2 years ago, is a great success. Twelve thousand farmers and many leading Agricultural Colleges are using it. It is the only machine I know of which scientifically sorts seed corn for drop planters.

New Book Ready

Send me no money now—just a Postal, for the finest, most complete Book on Seed Selection I've ever written. After the Book comes, write me what size machine you want and I'll ship it, freight prepaid, on receipt of $1.00. Then clean and grade all your Seed Grain. If you write today, you get my Book by return mail. Address nearest office.

FEEDING YOUNG FISH.

I have lately put in my fish pond a lot of young crappie. The pond contains a considerable amount of moss and other vegetable matter, but as I do not know what kind of food the young fish subsist on, I would like to know whether it would be necessary to feed them or not. If so, what kind of food should I give them? N. J.

Cuba, Mo.

In their natural state the food of crappie consists of crawfish, minnows, frogs, tadpoles, worms and mussels, while the young feed on insects and other minute forms of life found in the water. Ordinarily a pond one-half acre to one acre in area will furnish a sufficient amount of food for several thousand crappie. If there is an absence of natural food in the pond the fish can be fed on finely chopped beef liver, hog plucks and mush made of a low grade of flour. The mush should be given in a paste and the meat in its raw state in the proportion of one part of meat to three parts mush. E. LESTER JONES,

Acting United States Commissioner.

CONSTRUCTIVE GRANGE WORK.

The lecturer of the Massachusetts State Grange, Mrs. George S. Ladd, is planning some constructive work for the Subordinate Granges of the State for the present year. So important does this work seem to be that I would like to have Granges in all States consider the lines of work marked out by Mrs. Ladd, and of their own accord, adopt such of her suggestions as may be of local application.

First is the improvement of the farmers' homes. The lecturer argues that improvement in the home enhances our respect for it and for ourselves, and its attractiveness will have something to do with retaining the boys and girls. The State Grange offers a week's trip to Washington, D. C., to the farmer's wife who shall show in a written report to the executive committee of the State Grange, the most helpful way of managing the farm home as to comfort, convenience, economy and pleasure, with a statement as to the way the results were obtained.

Second, increasing the attendance and support of the church. This is a new idea to most Grange workers, but is an important consideration, nevertheless. The church and the Grange can and should work together. Massachusetts Granges will set apart one Sunday as Church Rally Day, with a view to increasing the attendance of Grange members at church, and for the Granges showing the largest per cent. of church attendance according to membership during the year, certain valuable prizes are to be awarded.

Third, there will be an effort to increase the efficiency of the rural schools. A bill will be introduced in the Legislature this Winter for State aid for the teaching of the practical arts in the public schools in the small towns of less than $1,000,000 valuation. There are 110 such towns in Massachusetts. The Granges of this State will be asked to support the bill.

Fourth, the local development of agriculture. One or two meetings will be held early in the year, which will be devoted to the discussion of the agriculture of the locality, as to best crops to raise, best seed, fertilizer, method of cultivation and the marketing of the crops. To stimulate an interest in this work among the young people the State Grange offers to the young man and the young woman, under 18 years of age, each a week's trip to Washington. The young man is to show by results, in a written report, what can be done taking into consideration location, cultivation and selection of crops from a half-acre of land. The work and management of operations must be done by the competitor, and he must keep an itemized account of all expenses and state results attained. The young woman must "do likewise" with poultry, fruit, flowers, bees, or any other line of farm work she may select.

The fifth endeavor must be to increase attendance on Grange meetings, for which two valuable prizes are offered, and the sixth is to make a study of the State's possibilities and resources with "Massachusetts Quality" as the motto and the standard by which every Grange endeavor is to be measured.

Here is an outline of some constructive work which, as said before, should bring results. The inactive Grange is likely soon to be in the dormant class. The Grange that serves its community best serves itself best, and proves that it has a reason for being. J. W. DARROW.

BLASTING FOR DRAINAGE.

On page 1375 "J. F. McF., Indiana," asks help in the matter of "two-thirds of a 20-acre field covered with muck." The cause is water held in suspension by a clay bottom; the depression is always bowl-shaped, holding the water as a bowl holds water, and the bottom is always clay. Surface cultivation, without drainage through this bottom, is simply a waste of time and material, and does not do the slightest good; the bottom of this bowl must first be broken through, and the water let off into the lower earth below. This can be done most effectively and at least cost with dynamite—exploding properly balanced charges of dynamite, at right depths; and if properly done, the conditions will never occur again. After drainage is secured, and proper elements now wanting in the soil supplied (potash, phosphate and lime) he will get results and have reclaimed a waste field. Bumper crops have been produced first season after reclamation, many times paying the cost. H. S. J. B.

R. N.-Y.—We understand that the field has been drained so that it can be plowed and worked. Lime and potash are certainly needed from the description.

MAINE POTATO SHIPMENTS.

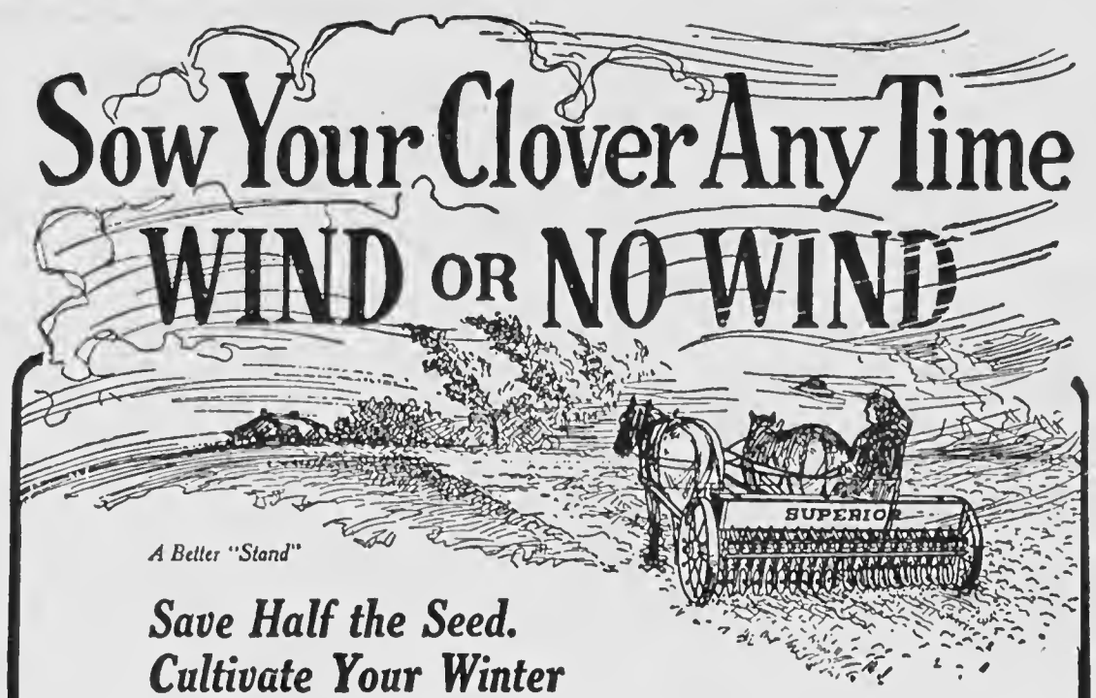
From July 1 to December 1 the Maine Central Railroad transported to the various markets from Central Maine 3,229 cars of potatoes, as compared with 2,850 cars for a corresponding period last season. During this same time the Bangor and Aroostook Railroad delivered to the Maine Central at Northern Maine Junction 9,722 cars, as compared with 5,984 cars in 1912. From the Canadian Pacific the Maine Central received 3,390 cars, as compared with 1,392 cars in 1912. This makes a grand total of 16,341 cars for the five months in 1913, as compared with a total of 10,228 cars in 1912. Figuring on a basis of 650 bushels for each car lot, the total number of bushels would be 10,621,650 for 1913 and 6,648,200 for 1912, a difference in favor of 1913 of 3,973,450 bushels. The transportations over the Maine Central lines are not yet available for December, but the reports from the B. & A. would indicate that this road has delivered to the Maine Central 1,600,000 during December, which makes the total shipments 12,225,650 bushels now reported.

There are no figures available showing the percentage of New Brunswick stock in the foregoing shipments. However, New Brunswick growers have been carting over the border all the season, and since the hearing in Washington on the 18th of December up to the time when the embargo was placed upon Canadian stock there was a general rush to market every barrel that could be sold. The shipments of Maine potatoes to the markets in 1913 will no doubt break all records and will probably be the largest for some years to come. While there is a feeling that the embargo on foreign stock will be permanent on all countries where the tubers are diseased, there is a feeling that countries where they can give a clean bill of health will be large shippers to the United States and for this reason the American grower will not increase his acreage.

One of the results of the most remarkable hearing in Washington on the 18th of December before the Federal Board of Horticulture was the bringing out of the fact that potato diseases have been increasing during the last 10 years. This has awakened the Maine grower to action, and steps are being taken to safeguard the potato industry, and so far as possible eliminate disease. On January 15 the various local organizations connected with the Farmers' Union of Maine will hold a meeting at Presque Isle for the purpose of discussing the potato situation. It is proposed to organize the farmers all over the country, and bring about a method of planting and general field inspection by experts that will reduce disease to the minimum. Relative to the seed situation, it is proposed that in addition to eliminating disease the same care be given to growing seed true to name, and a system of shipping that will assure the seed being kept pure and properly graded.

On January 28-29 there will be a State-wide potato meeting called "Maine's Potato Day," at City Hall, Bangor. There will be representatives from all over the State, and a large gathering is now assured. Speakers from out of the State, among them Prof. Orton of the Federal Horticultural Board, and many speakers from within the State will be on the program, and it is expected that the discussion will be of great value to all concerned. C. E. E.

Sow Your Clover Any Time
WIND OR NO WIND



A Better "Stand"

Save Half the Seed.
Cultivate Your Winter
Wheat and Increase the Yield
From Three to Eight Bushels per Acre

Many farmers report increased yields of Winter Wheat from 4 to 8 bushels per acre by the use of the Superior Alfalfa and Grass Seed Drill.

Not only did these farmers increase their yields of wheat AT NO COST WHATEVER, but THEY SAVED HALF THE CLOVER SEED and got better stands of clover than when broadcasting.

The Superior Alfalfa and Grass Seed Drill puts all the seed **in the ground** at an even depth. **Discs cultivate the wheat at the same time.** The angle of the discs is so slight that the wheat is not injured.

The Superior Force Feed Accurately Sows Crimson and Red Clover, White Clover, Alsike, Alfalfa, Clover and Timothy mixed, Timothy alone, Red Top Fancy, Blue Grass, Millet, Flax and all other Grasses in widest range of quantities.

If you are going to sow Clover in your Winter Wheat, the Superior Alfalfa and Grass Seed Drill will show you a gain of about FOUR DOLLARS PER ACRE.

This Drill is invaluable in rejuvenating old Alfalfa Fields, Pastures and Meadows.

Go to your local dealer and ask to see the Superior Alfalfa and Grass Seed Drill. Sold under the strongest warranty. You run no risk in purchasing.

THE AMERICAN SEEDING-MACHINE CO., Inc.
SPRINGFIELD, OHIO

Eureka Potato Planter

Send for Catalog—FREE

Profitable for the large or small grower. Plants potatoes at lowest possible cost. *One* man operates it. Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if wanted)—covers up—marks the next row. Accurate, automatic and dependable. Sold with or without Fertilizer Attachment.

Here's why you should select the Eureka Potato Planter:—Furrow Opening Plow is directly under the axle—that means uniform depth at all times. The seed drops in sight of driver. Steel and malleable construction makes long life and few repairs. Made in three sizes—for one or two rows.

We also make the Eureka Mulcher and Seeder. Shipped from branch near you.

EUREKA MOWER CO., BOX 840, UTICA, N. Y.

Potato Profits

depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why

IRON AGE 100 Per Cent Planters

often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "*100 Per Cent Potato Planting*" and copy of Iron Age Farm and Garden News.

EVENTS OF THE WEEK.

DOMESTIC.—Three hundred thousand dollars represents the estimated damage caused by a fire in St. Louis Square, which imperilled a fashionable French section of Montreal, Canada, January 1. Having no water available, the firemen were forced at first to use snow and chemicals, but the Montreal Water and Power Company, through shutting off private consumers, gave a supply of water sufficient to protect the adjoining property.

A tenement house fire on the lower East Side of New York January 1, caused the death of eight persons.

Fire that originated in the building of the E. O. Langen Cloak Company at Indianapolis, Ind., January 2, destroyed that building and burned out the W. K. Stewart Book Company's store and the L. S. Ayers & Company's stock rooms. The loss is estimated at about $300,000.

Flanked by State militia, Miss Fern Hobbs, private secretary to Governor West, closed up the saloons of Copperfield, Ore., January 2. The trouble followed investigations showing that the mayor is engaged in the saloon business; that his associate in such business is a member of the city council; that the proprietor of another saloon is likewise a member of said council and that his bartender is also a councilman; that a fourth member is a hanger-on around one of these resorts and in sympathy with their activities. This gives the saloon element absolute control of all city affairs.

Bart Dunn, Tammany leader of the Eighteenth Assembly district, Manhattan, and Joseph J. Fogarty, formerly an inspector for the State Highways Department, were sentenced in the Supreme Court at New City, N. Y., January 3, by Justice Tompkins to serve each 10 months on Blackwell's Island, New York, for conspiring to defraud the State of New York in the building of a Rockland county road. Dunn was fined $500, as was also the Dunbar Contracting Company, of which he is president. Justice Tompkins denied a motion to set aside the verdict and order a new trial. The execution of the sentence was stayed automatically, however, by the granting of a certificate of reasonable doubt pending an appeal. Dunn and Fogarty were released each in $5,000 bail.

Thirty-seven men lost their lives when the tank steamer Oklahoma sank about 50 miles southeast of Sandy Hook, January 5. Eight men, including the captain, Alfred Gunter, were saved by lifeboats from the Hamburg-American steamship Bavaria, in charge of Captain Graalfs. Five others were rescued by the Booth Line steamer Gregory. The Oklahoma was broken in two by the mountainous sea.

Fire January 6 destroyed the Paterson Opera House, Paterson, N. J. The loss is $100,000.

One of the biggest seizures of arms and ammunition ever taken from a steamship bound direct for a Mexican port was made January 4 on board the freighter Guantanamo, of the Ward Line, which sailed for Tampico. Under orders from the Treasury Department a squad of customs inspectors searched the Guantanamo for two hours before her scheduled departure. In their raid the inspectors found a dozen shotguns, ten thousand cartridges and a few dozen revolvers. It is believed that more munitions of war were on board hidden out of their reach. They arrested the boatswain and a seaman and brought them to the Custom House, where it is said they admitted having hidden the contraband articles.

Gales along the Atlantic coast did great damage January 3-5. The Jersey coast is again reported to have experienced a loss of $1,000,000, Seabright, which suffered so severely in the Christmas gale, being badly damaged.

Three hundred and two persons, of whom 149 were children under 16 years of age, were killed by automobiles in New York City in 1913, according to figures made public by the National Highways Protective Society. Twenty-five of these killings took place in December. The December fatalities were five more than the number for December, 1912, but at that they were 13 less than the number for November last, when 38 were killed. The decrease shown in December, as compared with November, is attributed by the society to the more stringent enforcement of the automobile laws. The number of persons killed by street cars in the city in 1913 was 108, as compared with 134 in 1912. The figures for December, 1913, were six persons killed; for December, 1912, 13 persons killed. Wagons killed 132 persons in the year just closed, as compared with 177 in 1912. Nine persons were killed by wagons last month. Outside of the city the figures for the State for December show nine persons killed by automobiles, 10 by street cars and three by wagons.

FARM AND GARDEN.—At the annual meeting of the Illinois State Horticultural Society, W. S. Perrine, of Centralia, was elected president to succeed J. Mack Tanner, of Springfield. The other officers, who are re-elected, are as follows: Vice-president, E. J. Baxter, of Nauvoo; secretary, A. M. Augustine, of Normal; treasurer, J. W. Stanton, of Richview; directors: H. G. Street, of Hebron; L. R. Bryant, of Princeton; Geo. J. Foster, of Normal; O. M. McElvain, of Bushnell, and W. W. Thomas, of Anna.

The sixteenth annual meeting of the Pennsylvania Dairy Union will be held at York, Penn., January 20th to 22nd, inclusive. The meeting will be divided into three sections, the milk dealers holding forth on the 20th, the milk producers on the 21st, and the butter and cheese makers on the 22nd. In connection with the meetings, there will be a show, as the combined efforts of the Dairy Union, the State Horticultural Association and the Live Stock and Plant Breeders. All of these associations will hold meetings in York during the same dates, as well as also will the American Berkshire Congress.

Secretary of Agriculture Houston approved, Jan. 5, the disposal of 1,000,000,000 feet of Western yellow pine timber from the Kaibab national forest in northern Arizona. In order to get this timber out it will be necessary to build a railroad 200 miles long, which will connect Colorado and Utah with the Grand Canyon of the Colorado, hitherto accessible only from the south. For several years the construction of such a railroad has been considered but it has been stated that the lack of assured immediate traffic was an effectual barrier. It is pointed out, however, that a contract for a billion feet of timber will overcome this difficulty by providing a commodity for transportation which, together with tourist and local traffic, will place the project on a paying basis practically from the outset. The necessary investment to construct the road will amount to more than $3,000,000. Bids for the timber will be received up to the middle of June, 1914, and three years will be allowed for the building of the railroads and mills and twenty-five years for the cutting of the timber.

After a delay of more than two years the so-called Chicken Trust cases came up Jan. 6, before the Appellate Division for argument on appeal. The defendants are Erving V. Dwyer, Arthur G. Dwyer, Charles Westerberg, William W. Smith, Charles R. Jewell, James N. Norris, William H. Norris, Charles T. Hawk, Charles Thatcher, Clenen Bishop, Samuel Werner, Charles Werner, and Solomon Frankel. On Aug. 15, 1911, they were convicted before Judge Rosalsky in the Court of General Sessions of conspiracy in restraint of trade. Sentence imposed in each case was a fine of $500 and three months in the penitentiary. Since their sentence the defendants have been out on bail. Between the time of their conviction and their sentence they served a few days in the Tombs.

We are market gardeners, and retail our truck on the street in Philadelphia, but manage to be through by Christmas. Prices during month of November were: Potatoes $1.10; half peck 18 cents; celery 15 cents bunch; beets three cents bunch; turnips 12 cents half peck; onions 20 cents half peck; salad five cents head; cabbage eight cents a head; spinach 15 cents half peck; carrots three cents bunch; cauliflower 15 cents each; orange pumpkins 10 cents each; young roasting chicken 25 cents a pound; stewing chickens 22. At the public sales fresh cows sell from $60 to $90; good horses $175 to $250. Hogs for killing, 11 cents a pound. Milk shipped to Philadelphia, five cents per quart; corn at the sales 72; fat calves 11; fat cows six cents per pound. G. H. S.

More Money From Your Hens!

Do You Want to Learn How?

WE are in a position to help you with your poultry. The best poultry writers in the country are ready to answer your questions, and will direct you step by step in the development and care of your flock. Through their help you may become an expert yourself, if you will follow their suggestions and take up a line of reading in connection with your practical work in the henyard. This service is free to all subscribers and their families. Make frequent use of it, and begin at any time.

Keeping a Pure Strain.

Do you advise using a cockerel with pullets of the same mating? I have 12 pullets and five cockerels from a trio of imported birds from Tom Barron's flock of English Leghorns. Can I keep them pure Barron, or should I cross them with American Leghorns for best results? The cockerels are finer ones. W. C. M.

Rupert, Vt.

By all means, keep the Barron strain pure. These Leghorns, with their superb laying qualities, are the product of many years of skillful breeding by an expert. There is, of course, no guarantee that their good qualities will be perpetuated in the hands of their American owners, but it would be the height of folly to unnecessarily introduce inferior blood. Select the best cockerel of the five and mate him with the pullets next year.

Chickens With Colds.

This is the time of year when the poultryman must keep a sharp lookout to detect trouble in his flock. About the first thing that appears to make him uneasy is a pullet with a swollen eye, and perhaps a running nose also. There are many remedies used, and I have at various times used different methods, but the one that gave me quickest results is as follows: I remove affected bird from flock, place same in a coop with a slatted front, placed upon a box off the floor, in some protected building. If the eye is closed and suppurated, take camphorated vaseline and coat all around the eye, taking care not to get any inside the eye. Should you have any two-grain quinine pills, give one morning and night for three days, or one-quarter teaspoonful epsom salts in a wineglass of water. Give this to the chicken half a spoonful at a time. One dose will do. Take one-eighth of a teaspoon of permanganate of potash and dissolve in a pint of water, to use as an antiseptic solution for the cleft, in the roof of the mouth. Pour some of the solution from the pint bottle in a small vessel about the size of a wineglass and keep it there a few seconds, and it will move its tongue about and force the liquid up in the cleft. This solution is not intended for drinking, as it is four times stronger than that given in the drinking water, but I find that this method used four or five times a day is quicker than using a weak solution in the drinking water.

After you have applied the camphorated vaseline for two or three days the eye will open, and then I make a solution of corrosive sublimate, one teaspoonful to one quart of water, and bathe the eye, pressing the lids apart and letting the water reach the eye. Boric acid, 15 grains to the ounce of water, is good, but the above gives me best results. I have cured my birds in five days. Now don't mistake this malady for roup, as it is not. W. E. BROWER.

This is good treatment with the exception of the use of corrosive sublimate. This substance is extremely irritating, and when used in strong solution in sensitive places like the eye, is very painful. Boiling water would not be more so. A teaspoonful to the quart is at least eight times as strong as should ever be used in the eye, and even this might better be replaced by the boric acid, which while not so powerful, is painless and soothing. M. B. D.

The Poultry "Systems."

I think M. B. D. in his reply to W. I. B. on page 1337 is decidedly unfair to the so-called systems for distinguishing the laying hens from the drones. Five or six years ago I paid one dollar for a book describing one of these systems, and I consider it the best dollar investment I ever made in the poultry line, as it has saved me many dollars every year. I have two special uses for the system. First, beginning in November or December, soon after the pullets commence laying, I handle every one of them every two weeks until February, keeping a record of their laying condition, and have thus been able to know, and save for breeders, my best Winter layers. And I find that the pullets getting a high mark in the Winter are generally the ones that are still shelling out the eggs late the following Autumn. Secondly, when the hens begin to slack up in egg production in August or September, I go over them every week, and ship to market those that I find have quit laying (unless they are to be saved as breeders). This latter plan alone has saved me many dollars. I have made many tests, and never yet got an egg from a hen I picked as a non-layer. In all my experience I have found but one hen whose pelvic bones did not close up to one finger's width or less when she quit laying and of course opens again when she again lays. I fear M. B. D. has never given these systems a thorough trial or he would not so utterly condemn them. I may say that in my opinion the originators of these systems go rather too far in their claims, but to the extent I have mentioned I consider them of great value. W. A. R.

Yarmouth, Me.

You are entirely right in saying that the promulgators of the various "systems" go too far with their claims; in fact, that is characteristic of systems in more than one branch of human thought and activity. Some one discovers or appropriates a small bit of truth and builds around it an elaborate structure of error. If there is any value in the method of selecting layers by noting the width of the opening between the pelvic bones, you will obtain it by a regular and systematic examination extending over a period of several months. Few would do this, however, but would depend upon one or two tests.

As a little test of this method, I went to my henhouse the other evening and examined 26 two-year old hens, none of which is laying. I was able to place one finger between the pelvic bones of six; two fingers between those of 14; and three fingers between those of six. Then catching 15 pullets, an unknown number of which are laying, the one finger test applied to five; the two finger test to eight; and the three finger test to two. Not much in that to help me select the layers. I understand, also, that the originator of this test has failed signally to pick out the layers from pens whose records were known and which were submitted to him for demonstration. M. B. D.

MR. CRABB: "A speaker in Syracuse said that the women of to-day are not using their brains." Mrs. Crabb: "She's right. If they were there wouldn't be so many getting married."—Buffalo Express.

UNFORTUNATE PEDESTRIAN (who has been knocked down and is a little dazed): "Where am I? Where am I?" Enterprising Hawker: "'Ere y' are, sir—map of London, one penny."—Punch.

RHODE ISLAND REDS

The famous Vibert flock of beautiful, brilliant, glowing cherry to mahogany red-to-the-skin rose and single comb thoroughbreds. Not uncertain layers mated to males from uncertain layers, but specially selected, long backed, low tailed, certified trapnested record layers, scientifically line bred along Government lines for heaviest winter egg production, with yearly trapnest laying rates of 211 to 267 eggs; bred away from broodiness, and mated to large, vigorous, brilliant red males out of heaviest trapnest record layers. Heaviest winter laying, large, hardy Reds in America, hen hatched and raised, on absolutely free range, in wide-open front colony houses, on a scientific plant absolutely free from roup and white diarrhoea. Highly fertile, clean, well shaped, unblemished eggs, gathered hourly, shipped daily, delivered when wanted, guaranteed unbroken. Vibert Vitality Day Old Chicks. Splendid breeding cockerels from trapnested hens, trios, mated breeding pens for sale. Prompt shipment, safe delivery all over North and South America, courteous, strictly upright dealings. Mating booklet upon receipt of stamp.

The Henyard.

THE EGG-LAYING CONTEST.

The egg output still increases; the seventh week ending Dec. 19 shows a gain of 42 eggs over the previous week, and a total for the week of 1,004. Tom Barron's White Wyandottes lead again this week ,as they did last, the score being 47, last week it was 49. His total record to date is 246. Francis F. Lincoln's White Leghorns are still ahead, their total being 253, but Barron's Wyandottes reduced the lead last week from 14 to 7. Three pens of White Leghorns tie for second place with scores of 40 each. They are Francis F. Lincoln's, Cecil Guernsey's and pen No. 42 from Storrs Agricultural Station, the "sour milk" pen. Tom Barron's White Leghorns are third with a score of 34, and Jules F. Francais' pen of Barred Rocks are fourth with 32 to their credit.

I am asked "whether any of these eggs are for sale for hatching?" There may be others who do not know that no male birds are kept at the contest, and that the eggs are useless for hatching purposes.

I give below the records of some of the leading breeds:

	Week	Total
BARRED P. ROCK.

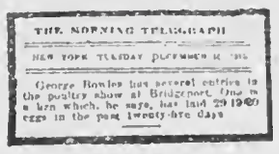
WHITE ORPINGTONS.		
P. A. Demgar, New York....	3	15

There are several breeds which have not laid yet. The unusual number of birds which have stopped laying and commenced to moult, will probably cut down the year's record of eggs considerably. There are 19 pens among the White Leghorns that have from one to seven of the birds moulting. The total number of eggs laid to date is 4,941.

GEO. A. COSGROVE.

"MIRACLE MARY" GOT NO RIBBON

Your article on page 1380 concerning the pen of scrub hens now competing with the blue-bloods for egg-laying honors at Storrs is exceedingly interesting, and states some good solid facts. Last week I entered some of my Leghorns at the poultry show of the Consolidated Poultry Association of Bridgeport, Conn. I knew they were not show birds, but they were good, profitable layers, and I wanted to see what the judges thought of them. A pen containing a cockerel and four pullets got fourth prize, and I received second prize for an exhibit of eggs, but over in a corner all by herself was a sturdy little hen that has been laying steadily and consistently ever since she was six months old. She is a member of a flock that originally consisted of 97 birds, but now number 93. This flock laid 13,635 eggs in a year; an average of 143 10/19 eggs per capita. Of course this is nothing wonderful when compared with the records at Storrs or the mark made by Mr. Cosgrove's 55 pullets; but it is a pretty good flock average. One of these birds, whom we call "Miracle Mary," was the little hen at the Bridgeport show. "Mary" has no trap-nest record; but nearly every day during the year we have found her on her nest. She is a pet, and her leg band number, 810, is very familiar to us because she seems to like to wait on the nest and have some one lift her off after she has laid an egg. Mary didn't win a prize. The judge passed her by with a sniff, and when I asked him



what was the matter, he said, "Everything." I hung the enclosed card (see above) on "Mary's" cage, and she attracted as much attention as the blue ribbon winners. She didn't lay an egg for the first two days of the show, but on the third day she just laid one out of spite, and on the way home in the express car she laid another. She is back on the job again, laying almost daily, and I wouldn't sell her for a whole carload of the judge's favorites. GEORGE BOWLES.

Connecticut.

Laying Type of Pullets.

I have 30 White Rock pullets, some hatched February 8 and some March 8. I have been told that unless you can lay two or three fingers between the pelvic bones that pullets will lay late and poorly. The above have not laid yet, while others hatched the same time are laying and I can lay three fingers between the pelvic bones very easily. Of the lot not laying most have small combs and some have the pelvic bones so close together one can only put one finger between, while others I can put one easily but cannot get two between. I have another lot of 25 pullets six months old, and I can lay two fingers between pelvic bones easily. Will pullets as described in lot of 30 lay at all? If so at what age will they probably lay? Will they be poor layers if they lay at all? Are not the pelvic bones of lot of 25 pullets, six months old, proper distance apart for that age? W. B. W.

Massachusetts.

Replying to your questions in their order, your description of lot of 30 chicks leads me to believe that they were bred for exhibition instead of laying qualities, therefore they will probably lay a few eggs when they get ready, at the age of eight to 10 months, and will develop into rather poor layers at best. Your lot of 25 pullets appears perfectly normal and should develop into good layers. In testing layers by the system you use it is necessary to take into consideration the fact that the same hen appears very differently when in laying condition than from what she does when not laying; so it is necessary to take into consideration the condition which the birds are in, and as it becomes evident that some experience is quite necessary before dependable conclusions may be reached. C. S. G.

BLACK MINORCAS.—Referring to E. D. F.'s letter on page 1289 and noting his desire for large white eggs combined with "table qualities" would call his attention to S. C. Black Minorcas—a breed that should be better known. They lay big white eggs and plenty of them, breed true, are easy to hatch and raise, are hardy and do well in confinement. Hens weigh seven pounds. Cocks nine pounds. Cockerels seven pounds. Hens lay, up to four years old, equally well as pullets; a fine breed for a moderate flock. Their one fault is their black legs and bluish thighs, which makes it difficult to dispose of quantities of surplus flesh, but which detracts nothing for home use or private custom trade. F. H. W.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

ROOT CROPS AND LEGUME SILAGE.

How will root crops, such as beets, carrots, etc., compare with silage? Can one feed carrots to milk and butter cows without flavoring the milk? Can turnips be fed to milch cows, and how do they compare with silage? Could cow peas or Soy beans be put in a silo whole? Sometimes late in the season the weather is unfavorable for curing hay, such as cow peas and Soy beans, and how would it be to pack them whole in the silo?
Delaware. J. W. F.

The comparative feeding value of corn silage, sugar beets, carrots and turnips based upon analysis of constituents is as follows:

	Water	Ash	Crude protein	Fiber	Nitrogen Free Extract	Fat
Sugar beets ..	86.5	0.9	1.8	0.9	9.8	0.1
Corn Silage...	79.1	1.4	1.7	6.0	11.0	0.4
Carrots.....	88.6	1.0	1.1	1 3	7.6	0.2
Turnips.....	90.1	0.9	1.3	1.2	6.3	0.8

It will be noted that the sugar beets and carrots contain a larger percentage of water, but smaller amounts of other constituents. However, from a standpoint of analysis pound for pound, there is not a great variation in feeding units; the difference, however, comes when one calculates the cost of production. The labor cost for growing, thinning, weeding and harvesting root crops is greater than that involved in growing corn for silage, and under ordinary farm conditions it is much easier to store corn in a silo than to put the roots in a cellar or cave well adapted to their preservation. An average yield of sugar beets would be about 20 tons per acre, carrots under similar conditions might yield 12 tons, while corn silage well matured could be expected to yield as much as 12 tons to the acre. The question resolves itself into one of labor cost, and in case 12 or more cows are maintained in the herd, it is generally conceded that the average is decidedly in favor of the silage. Carrots and mangels can be safely fed to dairy cows in case they are fed just after milking. When considering the matter of growing turnips for feeding dairy cows, it is a practice in South Jersey to seed the ground intended for grass, with two ounces of turnip seed, at the time of making the seeding for grass, usually after potatoes in September, and pulling the turnips just previous to killing frosts. They are stored in heaps which are covered with hay, and this practice seemingly is in great favor with the dairymen. The turnips are fed during the late Fall or early Winter, and usually if a large number of cows are maintained they have silage for later as well as Summer feeding. The same precautions in reference to the time of feeding should be taken, and unless they are fed in very large quantities no undesirable evidences are noticed in the flavor of the milk. Cow peas and Soy beans can be safely put in the silo, but should be mixed with corn in the proportion of five tons of corn to one ton of either cow peas or Soy beans. When the latter materials are ensiled by themselves the fermentation is excessive, and often burning results. The mass comes out of the silo with a very bad color, but is surprisingly palatable in spite of this condition. It was the practice of the New Jersey Experiment Station for a number of years to ensile cow peas and Kaffir corn with the regular silage corn, and the silage was of a very high quality. F. C. M.

Dairy Ration.

How is this for milk and butter? Please give proportions wheat bran, molasses feed, oats, corn, clover hay and corn fodder. How much should I feed per pound of milk? F. F. R.
West Virginia.

None of the feeds you mention are very high in protein. The various brands of molasses feeds vary much in comparison, so it is difficult to tell the value of this kind of feed without the analysis. Assuming yours is a good brand, analyzing 16 per cent or better of protein, I would say that the following would be a good ration for a cow giving 20 pounds of milk daily: Clover hay, 12 pounds; corn fodder, 12 pounds; bran, two pounds; molasses feed, two pounds; ground oats, two pounds; cornmeal, one pound. This allows one pound of grain for about three pounds of milk. If you have to buy the cornmeal, I should omit it and feed proportionately more of the other grains. C. L. M.

Feeding a Heifer.

How should I feed our heifer, 3½ years old? She will come in for the first time about March 1. Has suffered very much from indigestion. We have black grass, cornstalks, mangels, carrots and turnips.
Island Heights, N. J. P. J.

Black grass should be all right to feed your heifer twice a day, with cornstalks cut into one inch lengths at noon. The roots should be cut up and fed liberally twice a day. If your heifer is in good condition she will not need any grain with this feed until after she freshens. If you are careful not to overfeed at any time you should have no trouble with indigestion. C. S. G.

Ration for Dry Cows.

Will you balance me a ration for Jerseys now dry, due to freshen in one to two months? For roughage I have corn silage, mixed hay, some clear clover hay and oat straw. Grain costs as follows: Cornmeal $1.60, bran $1.50, cotton-seed meal $2, oats 50, distillers' dry grains $1.80. I have oats. G. T. S.
Sinclairville, N. Y.

For the present give one feeding per day of straw, silage and mixed hay, with three to five pounds of ground oats and bran, equal parts by weight, scattered over the silage. Two or three weeks after the cows freshen the following grain ration will be better for milk production: Cotton-seed meal, three pounds; distillers' dried grains, three pounds, and cornmeal, two pounds. If you can get white or flour middlings at not very much more than cornmeal it will be better than the cornmeal. If you have plenty of silage it will be well to feed twice daily, about one half bushel per cow at a feed. I prefer not to feed straw to a fresh cow, or one giving a good flow of milk, but by giving a little more grain straw may be used for part of the roughage, when the quantity of hay is short. C. L. M.

Buckwheat for Milch Cows.

How much value, if any, is there in buckwheat for feeding for milk?
Loon Lake, N. Y. W. G. L.

Whole buckwheat, ground, would make an inferior grain ration for milk production, ranking with cornmeal in this respect. It is fattening rather than milk producing. Buckwheat middlings, however, are one of the very best of milk producing foods, and the farmer should exchange his whole buckwheat for middlings when he wishes to use buckwheat for dairy cows. Buckwheat middlings rank with brewers' dried grains and gluten feed in milk producing value, but as the middlings are a local product in this State, they can usually be purchased cheaper than the others mentioned, and full advantage of this should be taken by dairymen who are in position to get them at home. Some find it difficult to understand why a portion of the grain can be superior to the whole as a milk producer. The reason is that the flour which is taken out when middlings are produced has little milk-making value, and may better be exchanged for the middlings out of some one's else buckwheat. M. B. D.

FREE-FARM ACCOUNT BOOK
KNOW HOW MUCH YOU MAKE THIS YEAR
No one shall pay a cent for Bickmore's Farm Account Book. Mr. Farmer, simply send us your name and address. Business farming puts money in the bank. This book is arranged to keep all accounts in simple form—more simple, and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborer's time record; and section for personal accounts. 64 pages; for ink or pencil. Not a cheap affair. Its quality is in keeping with
BICKMORE'S GALL CURE
A soothing, healing salve, the old-time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. Get full value out of yours. Bickmore's Gall Cure heals and cures Harness and Saddle Galls, Rope Burn, Cuts, Scratches, Grease Heel, etc. Keeps them sound and in condition for work. You don't have to lay the horse off. Bickmore's Gall Cure cures while the horse works. Great thing for sore teats in cows. Look out for substitutes and cheap imitations. Be sure to ask for Bickmore's Gall Cure at the store. The work-horse trade mark on every box. Farm Account Book is ready. Send today.

BICKMORE GALL CURE CO. Box 286 Old Town, Maine

KEEP YOUR HORSES IN PRIME WORKING CONDITION

A HORSE in the field—working for you—is worth two in the barn—simply eating their heads off. There is no way of *preventing* spavin, ringbone, splint or curb from suddenly laming and laying up your horses—but there *is* a way of *safely* and *easily curing all these ailments* and preventing them from *keeping* your horses laid up. For over 35 years there has been a reliable remedy that horsemen everywhere have *depended* on to save them money, time and worry.
Kendall's Spavin Cure
has been the trusted remedy of horsemen everywhere. It has not only been saving untold time, work and worry but thousands of dollars' worth of valuable horseflesh and has many times saved horses from death.
Here's a man—Mr. W. T. Campbell, Macadonia, Ky.—who not only saves money but actually makes money by using Kendall's Spavin Cure. He writes: "I have used 2½ bottles of your Spavin Cure, and have cured two mules of Bog Spavin. I bought the mules for $80.00 and can now cash them for $400.00. Shall never be without your great remedy."
Here's another man who has used Kendall's Spavin Cure with remarkable success. Mr. Floyd Nelson, Kings Ferry, N. Y., writes: "I have used your Spavin Cure for the past six years and have made in the neighborhood of $700.00 buying Spavined horses and curing them. I consider there is nothing equal to it if it is used according to directions."
Never be without a bottle of Kendall's Spavin Cure. You can never tell when accidents will happen—when this remedy may be worth the price of your best horse. It is better to be *prepared.*
Don't call your case "hopeless" in the face of above testimony.
Next time you go to town get a couple bottles from your druggist. The price is uniform, only $1.00 per bottle, 6 bottles for $5.00. At the same time ask for our invaluable "Treatise on the Horse," or write to
Dr. B. J. Kendall Co., Enosburg Falls, Vt., U. S. A.

BUFFALO MARKETS.

Winter conditions appear to have affected no produce prices as yet unless it be cabbage, which is not plenty and promises to be decidedly high before the early Southern crop is in. It now sells at $6 to $8 per 100, and good-sized heads retail at 10 cents. The market feature is still the growing plentifulness of Citrus fruits, especially grape fruit and oranges. Grape fruit of fairly large size now retails at five cents, and the big California navel orange is not above 40 cents a dozen. It has just appeared. Lemons are not much plentier yet. Full-size bananas retail as low as 10 cents a dozen. Apples are rather plenty, but high, the cooking, windfall grades retailing at not less than $1.25 a bushel, often showing that they have fallen where the ground is plowed. Some of the smaller Western apples, like Wealthy, retail as low as 15 cents a dozen; the big ones at three cents or more each. As appearance sells almost anything in preference to quality, the Western apple generally leads the dull Eastern fruit, unless the price gets unreasonably high. Green apples are now about as high as red.

The cheap vegetable is still potatoes, which retail as low as 85 cents a bushel, and still the little red Bermudas come in at $6 up per barrel to the retailer. The sweet potato supply is still large and promises to remain so, unless the weather becomes more severe. Celery continues to come in burned by the warm weather, very little of it capable of restoration to really marketable appearance. It retails at 10 cents the small bunch. New Southern green onions are coming in, retailing at 10 cents a bunch. There is plenty of leeks and garlic. Parsnips and vegetable oyster are 5 to 10 cents a bunch or small measure. The squash season closed early and in bad shape, as it had been most of the open season. The crop was poor and rotting was early. There are a few good specimens offering yet at four to five cents a pound retail. Pumpkins are keeping better accordingly and should be plentier. Often the sale would be much larger if people saw them on sale. Farmers dislike to raise them with corn, as they clog the binder badly. The egg market has settled down to about a 10-cent range ,40 cents for best and 30 cents for long-storage stocks. Some farmers are laughing over the efforts of ignorant people to make the hens lay during the molting season. They say that until that is accomplished the cold-storage problem will be with us. Butter is still quoted at 38 cents maximum to retailers, and retailing at about 40 cents. The price has been very steady for a long time, spite of feed fluctuations and Summer drouths.

J. W. C.

THE BOSTON MILK MARKET.

It was stated by some anthorities that Boston milk receipts were normal during the months of July and August of 1913, yet a recent statement of Dr. Jordan's that Boston did not have enough milk in July to supply the city's wants, and that unless an increase in production is brought about the people will have to turn to milk substitutes, the situation being serious, bears out what we have been claiming was the true situation, and these facts cannot be kept quiet and hidden by the milk buyer, as has been the case much of the time in the past. The low price received by producers of Boston milk has done much to bring the supply to a very low level, and if the statement is true that 3.8 cents per quart is the average price received by producers for Boston milk it is no wonder the supply runs so low throughout the year, even with best producing months. The one thing that can stop a higher price in the near future is the fact that under the new tariff the Canadian supply can be drawn upon, and undoubtedly will be to some extent the coming Summer, as a recent statement by Dr. Davis implies that this will be done. He says, I believe, that the dairymen of New England are alive to the fact that they can, if they wish, supply Boston with milk, and that the dealers would prefer to get their supply from them. In my judgment it would be a serious mistake on their part to let foreign milk come into this market, as if it once comes it is likely to continue. We know that in past times, when shortage was acute, some contractors wished to reach out into territory farther from Boston than this Canadian territory would be, but were refused permission by the city health board. A readjustment of present freight rates would make the idea less tempting, as present rates are in its favor very much, as milk can be freighted from there cheaper than from some points right here in Massachusetts.

It would seem as though the passage of the Ellis milk bill would help keep this milk out, but it is doubtful if this will happen this Winter because of the prejudice and feeling against this bill, largely, I believe, because farmers do not understand the bill, and are suspicious that it is just a move to get them deeper into the mire. However, intelligent, progressive, go-ahead farmers are largely in favor of it, and I believe it would do no harm, and perhaps lots of good. It would certainly do away with half a dozen different inspections we have at present, and put it all under one. It would also look after the dealers more strictly, and keep them under control, and not put it all on the producer. Personally I am neither for nor against it, but I certainly am not afraid it will harm me, and think it will help others who need help. I further believe that it pays to improve and keep up, or, better still, keep a little ahead of the times. I notice those who do are never complaining about the poor returns or price they receive, as they usually have no trouble finding a buyer for their product at a better price than their keep-in-the-rut neighbors receive. Any time one has a superior article to sell some buyer soon finds it out, and is ready to take it off our hands at a fair price.

I still believe the health boards of Boston and Massachusetts are and mean to be reasonable, and will not cause anyone to go to unnecessary expense in making needed improvements. A case to prove this came to my view this Winter. A man in a neighboring town wished to market his milk to the company I sell to, so went to them, but was turned down because of previous bad record with the Boston Health Board. He then came to me and asked me to see them for him, and see if I could get them to take him. I told him what he would have to do, or, rather, my idea of it. He said he would do it if they didn't want too much. I saw the manager, who, after I explained the case, said if I could get the inspector to pass him he would try him. The inspector at first refused, because he knew it was a bad case, but finally agreed if this producer really wanted to get in shape to sell to our company he would see him and tell him what he must do. I again saw the producer, and he agreed to fix up, so I sent up the inspector to see him. The result was the inspector's demands were complied with, the improvements made, and the man is selling to-day to our company. Personally I should have made this party do more than the inspector did before I should have taken him in.

A. E. P.

Massachusetts.

Prices here are as follows: Hay, $10; corn 75 cents; wheat 80; oats 45; barley 50; milch cows $40 to $75 each; butter 35 cents a pound; eggs 35; apples 75 cents to $1.50 per box.

C. O. B.

Canyonville, Ore.

Poultry dealers are paying to farmers, 45 and 50 cents each for live chickens, old and young, small and large, taken together. Dry cows are selling from $20 up; fresh cows from $50 up. Dressed hogs are selling at 9½ to 10 cents per pound; shelled corn $1.50 the hundred; potatoes $1 per bushel; hay in barn from $15 to $18 the ton.

W.

Dover, N. J.

Dairy products and hay are the principal market crops. Hay, choice Timothy, $14 per ton; seller boards hands, pitches hay to press and delivers to car. Low grades $10 to $12; oats 48 to 50; no potatoes shipped; local trade only, 75 cents per bushel. Apple crop a failure. We pay 45 cents per peck, $3.75 to $4 per barrel. Butter retails at 36 to 38; cheese 18 to 20; eggs 40. Most of the milk produced is sold to shipping stations. Price for December $1.90 per hundred. Good cows, to freshen in Spring, bring $50 to $75. Choice Holstein grades, springers or nearby springers, $75 and up.

O. L. B.

Canton, N. Y.

We had a very fine December; it has seemed more like a Southern Winter so far until Christmas night, when we had a severe snowstorm, which came in drifts and has made poor sleighing. Stock has been at large most of the month, very little stock being fed. Some are feeding pigs. Water in limited supply for Winter. A large amount of farm-work done last month, plowing, getting out stones, and general repairing. Times are dull at present; farmers are taking things easy. No cabbage on the move as yet, and not much in farmers' hands, and not very many potatoes, either. Some farms have been sold this month at high figures, considering the kind of property. Wheat 92; oats 40; corn 85; barley 65; hay, mixed, $12; red kidney and marrow beans $2.75; potatoes 50; veal 10½, live; poultry 12; pork 7, dressed, 9 to 10; lambs 6½ to 7½, live; butter 30; eggs 32.

E. T. B.

Canadaigua, N. Y.

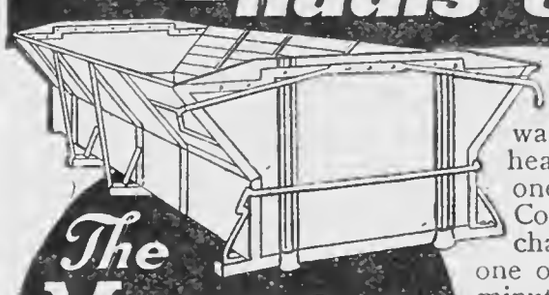
One Wagon Bed -hauls everything!



The MELROSE 15 Wagons in One

Think of the pleasure, convenience of doing all your hauling in the same wagon bed. No more back-breaking and heavy lifting, changing wagon beds from one purpose to another. With the Melrose Covertible Wagon on your farm you can change the bed from a grain tight to any one of the other necessary farm uses in two minutes, with no tools but your hands.

30 Days' Trial
Send No Money

All the word arguments in the world can't begin to convince you of the merit of this practical wagon idea. So we say, use this wonderful wagon on your own farm for 30 days—before you send us one cent. Try it out with your own work. Let it sell itself to you. Then after a month's good use decide whether you want to keep it or not. You'll be under no obligations to keep it. We won't urge you.

It is simplicity itself. There are no ratchet springs, complicated gears or intricate cogs to get out of order or cause trouble. Any farm boy old enough to handle a team can make the changes in no time.

Remember, now — we don't want you to send us a penny. Just write — tell us if you want complete wagon with geare or just the convertible wagon bed. The low price will astonish you. So don't hesitate.

Send today without delay for descriptive circular and details of offer. 16

BUSINESS COWS.

Farmer A. (in auto): "Good morning neighbor! Fine day this!"

Farmer B. (in wagon): "Yes, tolerably. Going to quit milking?"

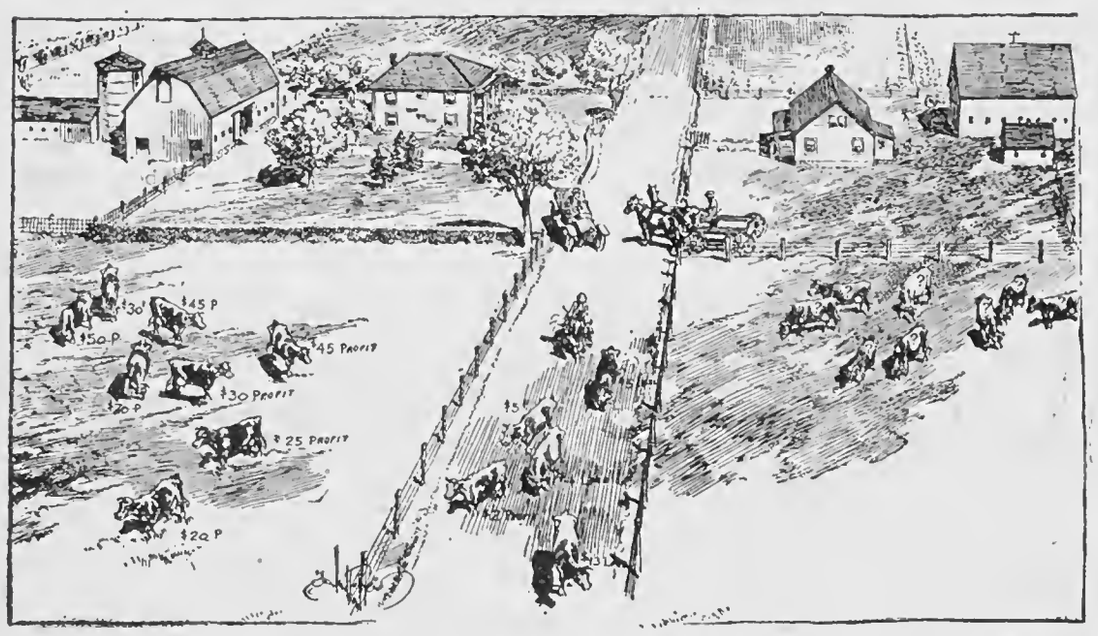
Farmer A.: "No, not exactly. I'm just going to quit milking for fun."

B.: "Well, how's that?"

A.: "These cows are eating their heads off."

B.: "They are, eh? But how do you know?"

A.: "I just weigh and test the milk from the herd and keep a record. Each



A MILK PRODUCERS' CONFERENCE.

cow gets credit for the milk she produces, also for the calf and the manure, then she is charged for the cost of maintenance."

B.: "But isn't that an awful lot of work?"

A.: "Well, it does take a few minutes a day, but I believe I get a dollar an hour for this work. You see it makes all the other work count. Before I kept records, I spent hours of labor on these cows and they didn't even pay for their feed. The labor was all wasted. It alone amounts to about $20 per year for each cow, to say nothing of the feed she consumes."

B.: "What is the matter with that brindle? She looks like a good one."

A.: "Yes, she made a profit of $5, but what is the use of keeping such a cow when you can just as well have one that nets $20 or more? These cows I'm selling averaged a loss of $2 each year, while those in the pasture averaged $39.37 profit. How much profit do your cows make?"

B.: "Well, let me see; really don't believe I know."

R. N.-Y.—The above dialogue with the picture printed above is taken from a bulletin issued from the North Dakota College. It was originally issued as a poster to be displayed in banks, stores and other public places. On the poster pictures are shown a dipper for taking cream samples, scales, Babcock tester and a statement of cow records. The following is also printed:

A Few Rules for Feeding.

GRAIN MIXTURE.

1. Feed one pound of grain mixture for each three or four pounds of milk produced daily, or—

2. Feed as many pounds of the grain mixture daily as the cow produces butterfat per week, or—

3. Feed all the grain mixture the cow will eat without gaining in weight.

ROUGHAGE.

1. Feed the average cow all the hay, fodder and straw she will consume without wasting it. If corn silage or roots are available, feed from 20 to 40 pounds daily in place of some of the roughage.

2. Alfalfa hay has a feeding value about equal to bran or oats. When it is fed, the quantity of grain mixture can be cut down.

All this may not seem very dignified to some of our scientists, but it is needed popular education.

SYMPTOMS OF TUBERCULOSIS.

Would you at some convenient time give a good article on tuberculosis, some of the first symptoms by which the farmer would have his suspicions aroused?

Lime Rock, Conn. W. B.

Assuming that you have reference to tuberculosis in animals, there are, unfortunately, no symptoms by which the disease in its earlier stages can be recognized, and ordinarily, there is nothing to arouse the suspicion of the owner until the disease is well advanced; frequently not then. It is often assumed that a tuberculous cow will cough, but unless the lungs are involved, cough is due to irritation of the respiratory tract from some other cause than tuberculosis. Enlarged glands about the neck, udder, or other portions of the body are frequently tubercular, and a general "out of condition" appearance which is obviously not due to care and feeding, should excite suspicion. The hair may be rough, pointing toward the head, the eyes dull, the hide tight, the appetite poor, and the general attitude one of deficient vigor.

Not only are the earlier stages of tuberculosis unrecognizable in cattle by unaided observation alone, but frequently the most advanced cases, as discovered by autopsy, are found in the sleekest, and apparently healthiest, members of the herd. It is not at all uncommon to kill a will become, dangerous and those which render the products of the animal unfit for use. M. B. D.

"ROBERT," asked the teacher, "did you throw any of those paper wads sticking on the blackboard?" "No," replied Robert, "Mine didn't stick."—Judge.

"WHERE'S your son, Hiram?" "Going to an agricultural college." "I've heard them colleges ain't practical." "You heard wrong. They put 'em right out in the field. My boy writes that next year they're going to let him take care of centre field."—Pittsburgh Post.

Save a Team During Harvest — Run Your Binder with 2 horses and a

THE MASTER KEY TO PERMANENT AGRICULTURE

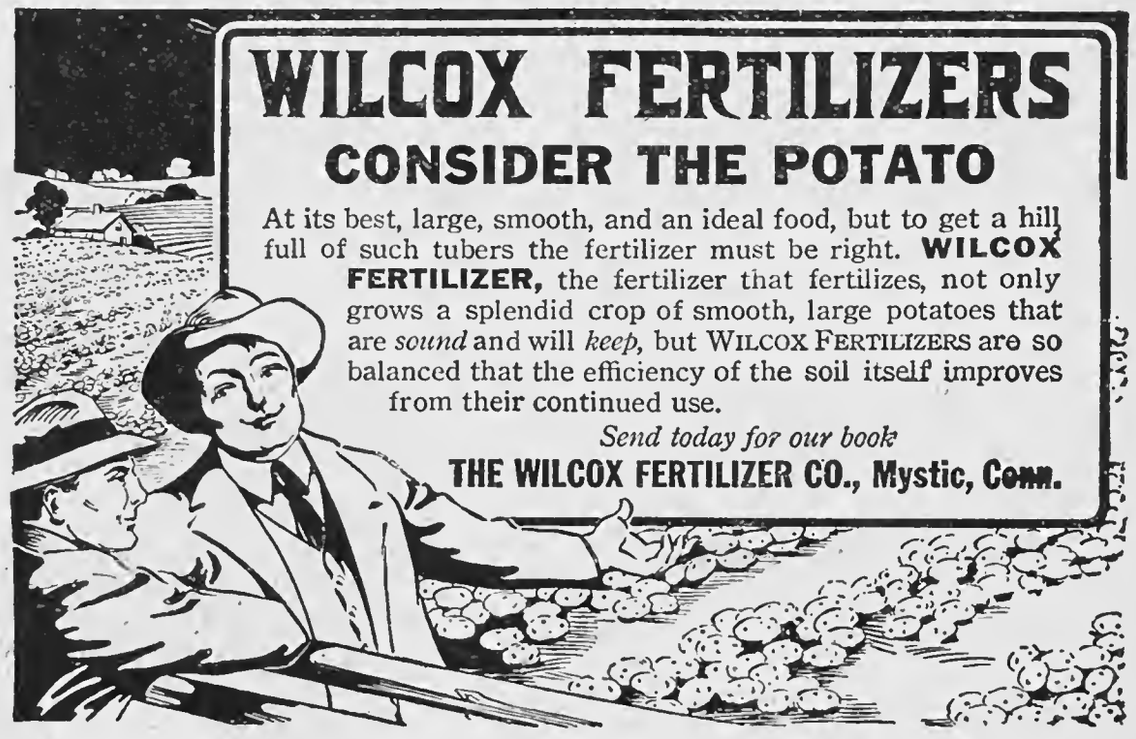
Phosphorus is so-called because it's use gives largely increased yields of clover, alfalfa and other legumes, which secure nitrogen from the air. The acids formed by the decaying roots of these plants make available the potash which is abundant in most soils. Recorded experiments on all normal soils in the Eastern and Middle Western states show greater profits from the use of phosphorus than from any other element, or combination of elements.

DAYBREAK ROCK PHOSPHATE

13% Phosphorus, Ground 95% Through 10,000 Mesh Screen

Rock Phosphate has been thoroughly investigated by the agricultural authorities and tested in the field by the leading Experiment Stations. It has proved to be the most profitable fertilizer on all soils deficent in Phosphorus, and the the soil surveys show this deficiency in 90% of the cultivated land in the Eastern and Central states. A review of these experiments and much valuable general information about fertilizers is given in "The Farm That Won't Wear Out," by Dr. Cyril G. Hopkins. This book will be sent free to the first 100 farmers who write to us for delivered prices on *Rock Phosphate*, and state where you saw this ad.

FEDERAL CHEMICAL COMPANY,
Ground Rock Deparment COLUMBIA, TENN.



WILCOX FERTILIZERS

CONSIDER THE POTATO

At its best, large, smooth, and an ideal food, but to get a hill full of such tubers the fertilizer must be right. **WILCOX FERTILIZER,** the fertilizer that fertilizes, not only grows a splendid crop of smooth, large potatoes that are *sound* and will *keep,* but WILCOX FERTILIZERS are so balanced that the efficiency of the soil itself improves from their continued use.

THE "CAST" HORSE.

A "cast" horse is one that gets down in the stall and is unable to rise. This is a common and often fatal accident, that might in many instances be prevented. Why does a horse become cast? That question is frequently asked, and cannot be answered in a word, for there are several causes of casting. It may happen from the halter rope or strap (shank) being so short that when the horse tries to rise he is held too close to the manger and his feet slide under it, keeping him down. Where the manger and hay rack do not come down flush with the floor a dangerous open space is left into which the feet are apt to slide and become caught, and we have known of at least one case where the horse got his head caught in the same way and broke his neck. The accident is also liable to happen in a stall that is too narrow or too wide. In the narrow stall the horse rolls up against the partition, and is unable to get up, or he turns partly around in a wide stall to scratch his tail and becomes caught and cast. When rolling in a wide stall, or box stall, the horse may get his shoes caught by the heels under a partition board that does not come down flush to the floor, and then finds he is unable to rise. Sometimes a horse manages to kick his foot through a thin partition board, or between two weak boards, and in struggling to free himself falls and stays down. Often the leg is fractured when such an accident occurs. Casting may also occur in another peculiar way. The standing horse, when scratching his ear or head with a hind foot, gets the foot over the halter rope or caught in halter, and goes down in a heap, kicking and struggling until he becomes exhausted. In one case on record a horse when scratching his head got a foot "impaled" upon one of his long, sharp tushes (canine teeth), severed an artery, went down and bled to death. The latter accident could not well be prevented, but the other causes mentioned above might well be removed.

The manger should always come down flush with the floor, leaving no space to trap the horse. This also prevents festering manure and trash from collecting at the head of the stall, and incidentally closes a favorite highway of rats. A stall should not be less than four feet six inches, or more than five feet two inches in width for ordinary horses. Very large draft horses need a trifle more space, but for them it should not be excessive. A brood mare should not stand in an ordinary stall when heavy in foal. So stalled she is afraid to lie down, hence suffers from dropsical swellings of the abdomen, or "stocking" of the legs; or she lies down and becomes cast. Many a mare has aborted as the result of this accident, and in more than one instance we remember of mares dying under such circumstances. Give the brood mare a roomy box stall when in the stable, and see that she is abundantly exercised every day. Stall partitions should be made of long, strong, thick planks braced at the center of the partition and at each end. Such planks "give" but do not break or splinter when they are kicked or rolled against by a horse. Partitions built of short planking put in perpendicularly are dangerous. The horse may kick an opening between two planks, catch his foot in it and go down or break his leg. In box stalls, which should never be less than 8x8 feet in size, and ought to be 12x12 feet, the partition walls should come flush to the floor, and better still, should be slightly sloped toward the center of the stall to lessen the likelihood of the horse's shoes becoming caught when he rolls. Box stall partitions sloped inward a foot also prevent a horse from rubbing his tail. Such walls are best used in box stalls over 12x12 feet in size. The partitions of a colic box stall in a veterinary hospital should be well padded. Halter ropes or straps should be sufficiently long, have "sinkers" of wood or metal attached to their free ends, and work freely through large metal rings. It is a mistake to fasten the halter directly to the manger.

When a horse is found cast in his stall do not become "rattled," as often occurs. Many a horse has been shot as paralyzed that would get up in time if sensibly treated. Remember that when a horse has been cast for a long time the hind leg on the under side tends to become numb or cramped from lack of circulation of blood. In this condition it is useless to the horse. Pull the horse out of the stall, if that is found possible. Never try to make him get up when it is seen that he is cast. He has tried his best to rise and failed. If he cannot be pulled into the runway at the rear of the stall, *pull down the partition against which he is cast;* then roll the horse over and examine the legs that he has been lying upon. One of them may be broken. That often is found to be the case, and usually necessitates the destruction of animal. If the legs are found intact proceed to move them thoroughly and massage the muscles to stimulate normal circulation of blood. A stimulating liniment rubbed upon the muscles will more quickly induce the circulation. After the extremities have become warm and sensitive encourage the horse to rise. If he cannot do so have several men assist him, if necessary helping to lift him by means of a folded canvas sheet or even a wide plank passed under his belly.

Before shooting a cast horse that is unable to rise, although his leg is not broken, have the veterinarian use the catheter to draw off the urine. Azoturia often is brought on by the struggles of a cast horse that has been standing idle in the stable. The urine in such a case will be found dark red-brown in color, or like strong coffee. The disease may prove curable by the intelligent treatment of a qualified veterinarian.

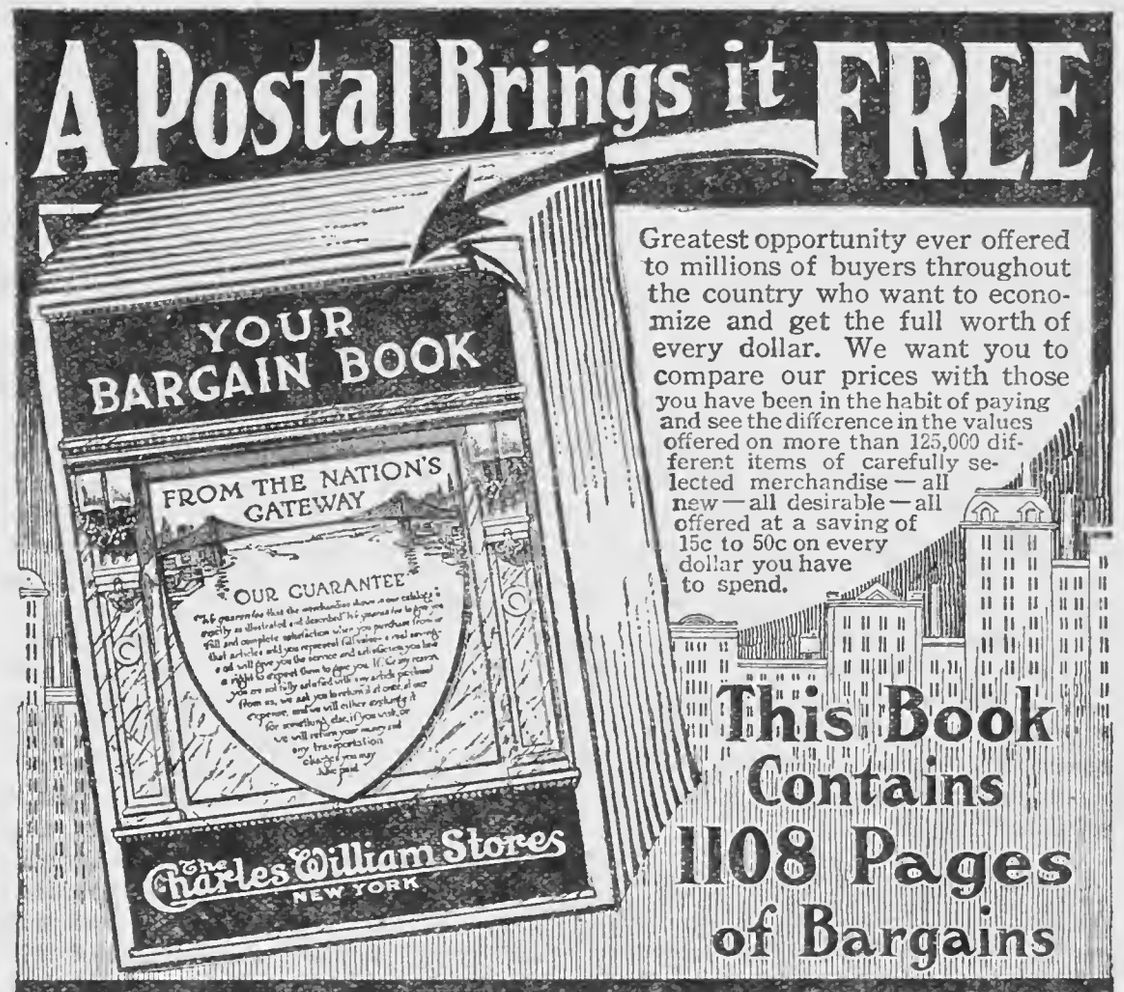
A. S. ALEXANDER, M.D. C.

Experience With Dairy Breeds.

I have been much interested in your discussion of breeds. I will give my experience on the subject, and perhaps some "back-to-the-lander" may profit by it. I have bred Holsteins, Jerseys and Guernseys, have sold milk, butter and cream. I have weighed the milk and kept its record. So the following information is nearly accurate as a busy farmer can have it. It might be well to note here that this is a very rough hilly farm, like thousands of our New England farms, and my experience has been altogether on rough rocky New England farms where cows cover miles in a day while in pasture to secure food.

The Holsteins I have had in the past have been great, large-boned cows that would eat in a day 10 pounds of silage and 25 pounds of hay, besides a large grain ration. As we are told by the experiment station that large cows are the only cows, therefore I was quite sure I was on the right track, for these great big sleepy cows gave more milk and cream than nearly two of the Guernseys or Jerseys in the same barn, and I was positive that a large, bony, big-feeding machine in the shape of a Holstein was the only cow to have. But in the Spring, when I turned out my cows in the large stony pasture in the hills with all those beautiful trickling springs, the would-be back-to-the-lander dreams of my Holsteins began to get poor in flesh, shrink in weight and milk. Not so however with the smaller rustlers, the Guernseys and Jerseys. They were scrabbling over rocks here and there, never tiring, and through the Summer months and early Fall I became positive that Jerseys or Guernseys were the only breed for a New England farmer to own. But at the same time I had a warm place in my heart for the Holstein cows and could not give them up. So after a year of careful search I found a breeder who had my New England type of a Holstein, which he had been working up for years. They have the energetic vigorous, active temperament of the smaller breeds. They have also the large muzzle and barrel of the big Holstein cow. But they have not the bones, their bodies are compact but not beefy, although they make better beef than the cow with so much bone. They have the milking qualities for which the Holstein is noted and at the same time will rustle for a living on my rough pasture with any of the smaller breeds.

I do not like small cows, but on our rugged, New England hills there is a limit to size, unless you can combine it with activity. This is a quality which does not exist to any great extent as a rule in a large big-boned cow. But it is not the breed that makes the success in dairying; it is the man. There are successes and failures in all breeds, due solely to the man and not the breed. H. G.



Everything Your Family Needs

—in the home—workshop, or on the farm, can be purchased from us at an immense saving. In clothing, apparel, dress goods, underwear, millinery, shoes, furs, coats, boys' clothing and many other lines we show advanced styles at no greater cost than you would pay for inferior qualities on last season's fabrics. Everything we show has been carefully selected and cannot fail to appeal to careful buyers, both as to quality and price. We insist on giving every customer satisfaction. We, therefore, guarantee every purchase to come up to your fullest expectations no matter where you live or what you buy from THE CHARLES WILLIAM STORES.

We Pay Delivery Charges on Thousands of Items

In every possible case we give our customers the benefit of prepaid delivery, insuring rapid service. Write for "YOUR BARGAIN BOOK" C-000 today and have the advantage of buying direct from New York without paying middlemen a big profit on the things you need (3)

PUBLISHER'S DESK

We did not break our record for January 2nd, our first business day of the new year; but we did beat all records for the last month of the old year. We keep our records and compare results day by day. The first week or two of December we were a little behind, but towards the middle of the month the mails increased, and kept up right along to the last day of December. We are always anxious to have a good showing for the day after New Year's, as this begins a new annual record, but we are not disturbed when, as in this case, the returns are only a trifle under the records of the previous year. With the enlarged paper and the increased expense, it, of course, is necessary to have a regular increase, and we want subscribers who are interested in the paper and its progress to know just what is being done. All can help much by prompt renewals. It saves time and expense, and leaves us free and confident to pursue the work of making the paper useful and helpful.

A short time ago I shipped a case of eggs to Johnstone & Coughlan at 172 Duane street, New York, whose advertisement has recently appeared in your paper. At the time of the first shipment I wrote them mentioning THE R. N.-Y. They reported that the eggs sold for 50 cents and made proper returns. A week later I shipped another case of the same kind of eggs, equally fresh and at least a little larger, and they reported the sale at 40 cents. In the meantime the market had advanced seven cents per dozen. I wrote them a week ago asking the reason, but they do not reply. My eggs are pullet eggs, and probably will not bring the highest price, but I see no reason for a drop of 10 cents when the price is advancing. I am enclosing the account sales. R. A. W.

New York.

Johnstone & Coughlan's explanation of the above complaint is that the shipper was fortunate in getting so high a price for the first shipment of eggs, and state that the shipment complained about was sold at 42 cents per dozen and returned to the shipper 40 cents. The account sales shows that these eggs were received by Johnstone & Coughlan on their own account, and were not handled on a commission basis. The firm has given us the name of the purchaser of this consignment of eggs, and we believe the eggs were sold at 42 cents per dozen, as stated. We, however, are unable to understand the evident desire of Johnstone & Coughlan to evade the commission merchant's law by accepting farm products on their own account instead of selling on a commission basis, as formerly. We therefore wish to withdraw the implied endorsement of this firm by THE RURAL NEW-YORKER because of having previously accepted the advertising of the firm. We shall not do so in the future.

Some time ago you took up a claim for me with the Lake Shore and Michigan Southern Railway regarding a claim for the killing of six shotes. I am glad to say that your services have been availing and I have check for $50 for same. Furthermore they have, at my request, placed cattle guards at the crossing. I cannot thank you too much for your kindness and attention. The kindly spirit which is back of your paper is what is and has been winning you so many friends. That you prosper ever is my sincere wish. S. R. W.

Michigan.

The subscriber tried for some time to get attention, but could not get reply from railway, so that we are gratified to know that our little service brought such prompt and encouraging results.

I sent Mrs. Arthur Hawkins, Goshen, N. Y., $1 for 15 White Orpington eggs. I cannot get any reply, although the postmaster states the money order has been paid. She does not answer my letters. O. A. H.

New York.

Mrs. Hawkins failed to reply to our inquiries also. This, experience will have to be charged up to profit and loss, but our readers will be warned for another season.

The Federal Grand Jury that has been investigating Florida land companies ended its work to-night by returning indictments against two officers of the Miami Everglades Land Company, and four men connected with the Everglades Plantation Company. The men are Edward Van Asmus, Frank M. Perkins, S. J. Mattocks of Kansas City, and R. Ernest Perkins of Brookfield, Mo. The Government charges that the Miami company sold 17,000 acres of land west of Miami, Fla., on which it realized a profit of approximately $165,000. The other company, the Government alleges, sold 10,000 acres of land west of Fort Lauderdale, Fla., realizing a profit of $136,000. The Government charges that the land was underdrained and unfit for cultivation. It is charged in the indictment that these promoters represented that Everglade "muck," did not need to be fertilized in order to raise good crops and was shown by chemical analysis to be the richest natural soil known anywhere. Of course, some kind of crops would flourish better by being fertilized, but the best crops he had ever seen were grown on the Everglade lands without any fertilizing.—Kansas City Despatch.

Is it worth anything to the farmers of this country to be warned in advance against schemes of this kind? The profits on these two schemes alone would nearly pay for the entire subscription list of THE R. N.-Y. for three years; and for the last five years we have been warning northern farmers against the fake promoters in the Florida Everglade lands. While other papers—some of them very high-toned—have been accepting the advertising of Florida promoters, we have been telling the truth about them, and now the action of the Post Office Department has confirmed our information. Every individual subscriber has not profited by our advance showing up of this scheme, because they have not all had any thought of investing in Florida swamps, but it is evident that this $300,000 would have been saved to the deluded investors who enriched the swamp promoters, if our information could have reached them. This is a service, which as far as we know, no other paper attempts, and it seems to us to justify the suggestion that old friends of THE R. N.-Y. use their influence to increase its circulation among fellow farmers.

It was an unexpected pleasure to read the $10 voucher yesterday. It was a just claim long drawn out, and I am under many obligations to you and your valuable paper. W. G. D.

Massachusetts.

Household furniture shipped over the Central Railroad of New Jersey was damaged in transit so badly that it could not be repaired. The claim was entered at the lowest amount of value consistent with the damage, but the claim was declined on one basis or another, and it was only by persistent effort we were able to get it closed out in seven months.

The E. G. Lewis scheme up in San Luis Obispo County, California, is the most gigantic swindle of the age, and the marvelous part about the whole business is there are suckers who really believe the fellow, even after all the exposition and publicity THE R. N.-Y. gave him. I was up that way last Spring, and all the vegetation growing on a square mile of the country could have been put in a bushel basket, and no water developed to grow more. P. G.

California.

The above is from a man who probably knows more about the land schemes on the California coast than any other one man in that State. After collecting money from the people on something like 75 schemes, covering a period of 15 years, and collecting in all ten to twelve millions, all of which was lost to the dupes, he is now working the California scheme, and deluded women are still sending him their money.

I have been a subscriber to THE R. N.-Y. for many years, and have read the fakers with interest, and now I think I am faked myself. I judge the woods are full of this sort of fairies at this time. I am judging by the many circulars that come through the mail. I ordered some automobile tires from the Goodwear Rubber Company, of Cincinnati, Ohio, enclosing my check for $17.95 to pay for them. They acknowledged receipt of the order, and same would have prompt attention. A letter inquiring why the tires were not sent was returned unopened. I then looked up my check and found it had been deposited at Dayton, Ohio, but no tires have been received yet.

Tennessee. A. W. W.

Our letters were also returned with the information that the company had "gone and left no address." The history and papers in the transaction have been turned over to a post office inspector.

J. J. D.

"YOU eat very little, Mr. Smith," said the maiden coyly to the bashful lover who had been invited to share the family Christmas dinner. "Yes," replied he, and for once he saw a chance, and, grasping his courage, he said: "To sit next to you, Miss Grace, is to lose one's appetite."—Ladies' Home Journal.

A DAIRY farmer who does not use a cream separator is losing up to $15 per cow per year. Complete your dairy equipment by the purchase of an International Harvester cream separator—Lily, Bluebell or Dairymaid. These separators skim closely—leaving barely a drop of cream in a gallon of milk—and they will do it for years.

These machines are furnished with pulleys for the use of power. Belted to a small I H C engine, you have the best outfit it is possible for you to buy. Note the low supply can on I H C separators, the height of the milk spout which allows a 10-gallon can to be used for the skim milk, the strong frame with open base which can be kept perfectly clean, and the dozen other features which make these I H C machines the best.

Your local dealer should have one of these machines on sale. If he has not, write us before you buy and we will tell you where you can see one; also send you an interesting book on separators.

PRODUCTS, PRICES AND TRADE.

BUTTER.

There has been a drop of two or three cents on the higher grades of creamery. Business has been dull and receipts increasing. Very few sales of best creamery are noted above 35 cents, 30 to 33 cents covering a large amount of trade. State dairy is practically unchanged, mainly because of light receipts. The top price quoted, 32 to 33 cents, is extreme. Trade in factory and packing stock butter is quite active at 18 to 21 cents. Storage creamery is selling at 25 to 30 cents, exceptional qualities one cent higher.

MILK.

A considerable surplus has been reported at New York for the past two or three weeks. Dealers usually magnify this surplus and make it a strong argument toward lower prices—for the farmers. It seems doubtful, however, whether recent contract prices will be cut unless weather conditions in January prove specially favorable for a heavy milk flow. The probabilities are against this as January usually runs. Prices during December, and now prevailing to a large extent, are 3¾ to 4 cents for B, and 3¼ to 3½ cents for C. These figures in the 26-cent zone make a gross of $1.81 to $1.91 for B, and $1.61 to $1.71 for C. Retail prices to restaurants and hotels run from 6 to 6½ cents for users of two to three cans per day.

EGGS.

The advance in price of fancy eggs at New York two weeks ago was apparently unwarranted, as trade at once slackened, and although there has been a drop of six to eight cents on other grades, business still remains quiet. From 38 to 42 cents covers a large range of this trade now. Holders of both fresh and storage stock are making urgent efforts to move their surplus, cutting prices when sales seem a probable result. Usable storage eggs can be had at 28 to 30 cents. Western fresh gathered are selling from 33 to 35 cents. Fresh eggs from China are reaching the Pacific Coast in commercial quantities. They are better than average grades of storage in spite of their 4,500-mile trip. Fair to choice eggs along the Coast are selling at 35 to 45 cents.

POULTRY.

The market is very dull on both live and dressed stock. The demand for turkeys is extremely light, so that dealers with supplies held from the holidays are having a hard job to get rid of them at anything over 18 cents. The only item in the whole list that shows any activity is roasting chickens, which sell at 23 cents or a trifle more if fancy. Choice fowls go mainly at 15 to 17 cents, and under grades 12 to 14 cents.

APPLES.

Prices remain about the same as for several weeks. An occasional lot of choice Baldwins brings $5, but $4.50 is the top for most varieties, and under grades go from 75 cents to $1 less. Western bushel boxes bring $1.50 to $2.50; exceptionally fine $3, which is well toward four cents each.

POTATOES.

An advance of 15 to 25 cents per barrel is noted in the better grades. Considerable of the foreign stock on hand is poor, rarely exceeding one cent per pound. Holders at country points are not anxious to sell, believing that a primary price of at least $1 per bushel may be had without materially lessening consumptive trade. There is considerable indication that this price, or even more, may prevail for best stock. The crop for the entire country is considered to be above the 10-year average, but this is not a safe basis on which to figure prices unless the great increase in population is taken into account.

Foreign beef to the amount of 9,000 tons arrived in this country during October and November. Canada sent nearly one-half, 4,000 tons, the remainder coming from South America and Australia. Argentina supplied 3,000 tons. The large concerns have quite thorough control of these importations, but in December there were independent shipments of about 1,700 tons from Argentina. These may increase sufficiently to make some price reduction. There is more hope of lower prices on foreign mutton than beef, however, as mutton is not so profitable for long storage, and there is less expensive hotel demand for mutton than beef. Every hotel that amounts to anything must have its choice cuts of beef for steaks and roasts, and its "spring" lamb; but mutton is in a different class, and the only thing necessary to increase home production of this excellent but cheaper meat is a curtailment of the dog crop.

A cargo of Australian wool, the largest ever received at San Francisco, arrived January 4. There were 1,800 bales, valued at $100,000.

New York harbor received 9,654 vessels from foreign countries last year, 2,664 being sailing craft. From our own coast there were 2,693 steamers and 2,195 sail, mainly schooners.

There were 16,000 failures in commercial business reported in this country during 1913, totaling $272,500,000, which is considerably above a normal year. New York State made the most disastrous showing, 2,728 failures, with liabilities of $72,800,000, or $22,000,000 in excess of 1912. Illinois came next, with 1,081 failures for $20,500,000.

Fall River, Mass., textile concerns have had an unusually prosperous year, dividends totaling $2,075,452 having been paid by 32 corporations reporting. This is an interest rate of 7.1 per cent on the capital, and 2.85 per cent more than in 1912. An increase of nearly 40,000 spindles is noted in these mills. W. W. H.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII., No. 4239. NEW YORK, JANUARY 24, 1914. WEEKLY $1.00 PER YEAR.

NOTES ON CORN-BELT FARMING.

The Curse of Tenant Farming.

GENERAL CONDITIONS.—During Thanksgiving week last Fall I had the opportunity of visiting for a day or two a locality in Illinois which is in the heart of the richest part of the corn belt, and where farm practices are typical in many ways of much of the north central United States. I had not been in this section before, and several features of farm conditions which I observed struck me with perhaps more force than would have been the case had I been thoroughly familiar with the neighborhood beforehand. It shall be my purpose here to give some of the impressions which I secured on that trip. The soil is for the most part black, and as productive naturally as almost any soil on the globe, although patches of lighter, less productive soil occur. The chief crops are corn, broom corn, and oats, with some clover and a very little wheat. Live stock is scarce. The roads are of the original soil of the region, and are very poor in Winter, but good in Summer. Much of the farming is done by transient tenants. All of these features have to do with the status of agriculture in the region. The current farm practice is a good example of the prevalent "mining" system of farming. The soil is looked on as a reservoir whose purpose is to produce corn or broom corn. Rotations are conspicuous chiefly by their absence, and when present are apt to be of the form corn, corn, oats; or corn, corn, oats, clover. The oats and clover crops are looked upon as a sort of soil medicine to prepare for another crop of corn. Soil which will not produce at least two good crops of corn in succession is looked upon as "pretty durned poor," to use the expression of one of the local farmers with whom I talked. Further light is thrown on the attitude of the people to the different crops by the remark of a farmer's boy, who said, in speaking of the rotation followed by one of the best farmers in the neighborhood, that he "farms" the land two years and then runs it in oats and clover. Most of the corn and oats and much of the clover are sold directly, a practice for which the prevailing tenant system and the lack of farm capital are at least partially responsible.

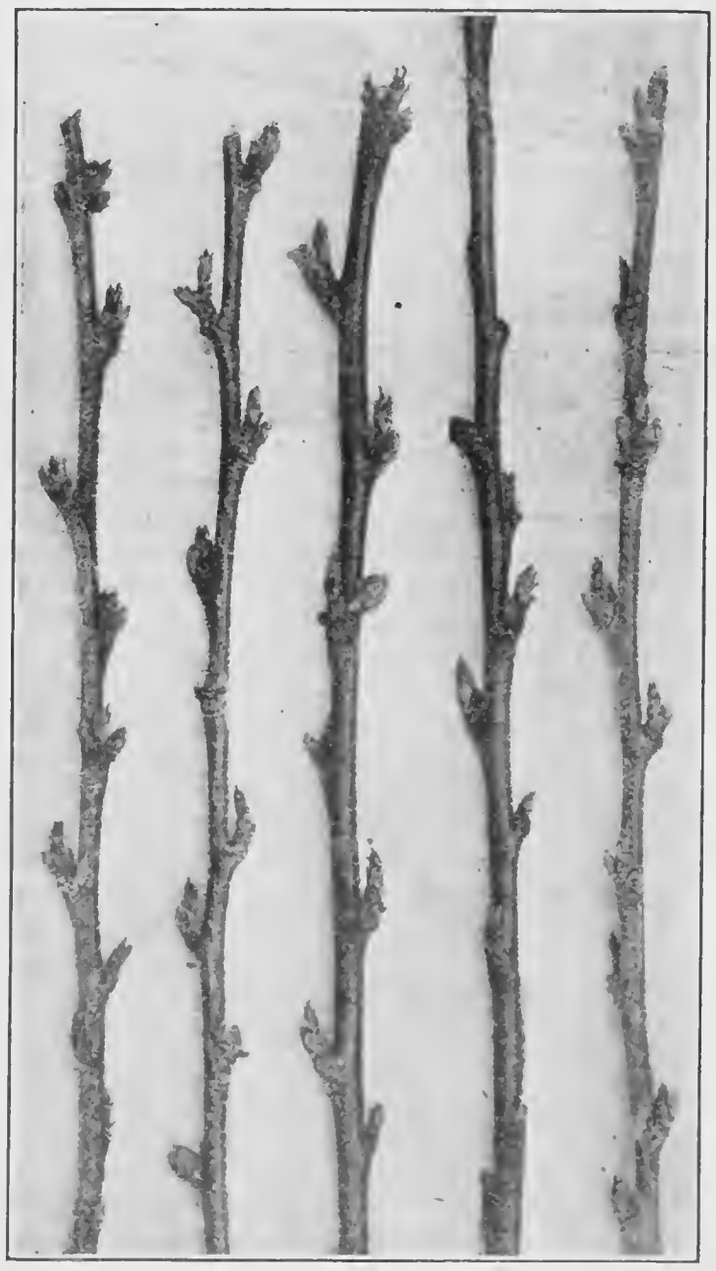
"COMRADES TRIED BY MARCHES MANY." FIG. 44.

ROADS AND MARKETING.—Not only are these products sold off the farm, but they are sold during the comparatively short time between harvest and the advent of bad weather in the Winter. One of the most significant facts in this neighborhood is the unimproved condition of the roads. These roads, as before mentioned, are of dirt, and often become impassable or nearly so in the Winter and Spring. As a consequence, crops must be marketed during the Fall, while the weather is comparatively dry. Profits are thereby lessened, and the working capital of the producers reduced. Improvements are discouraged and social intercourse is made difficult. This locality (and many more similarly conditioned) needs a system of hard, smooth, all-the-year-around roads. Such a system would be very expensive in many places, and it will probably be many years before it will come; but the future of agriculture depends on it, and the cost is almost negligible in view of the value it would have.

LACK OF CAPITAL.—Another cause of the immediate marketing of crops is the lack of farm capital. Mr. A. has 1,000 bushels of corn which will bring him at present 80 cents per bushel, or $800. If he can hold it a couple of months he can get 90 cents per bushel, or $900. He owes B. $800, however, which must be paid at once; and so the corn is sold. Such conditions occur repeatedly. They discourage good practice in farming, they prevent the acquirement of many comforts in the home, and they limit the intellectual development of the farmer and his family. If the bankers could only recognize the harvested corn as good security, a loan might be made on it, and the farmer could retain the profit due to the rise in price. Another way in which the lack of farm capital shows itself is in the lack of adequate improvements on most farms, especially where the farmer tills his own land—not that landlord-owned land is any the better improved, but that the motive for the failure to improve in this case must be something other than the lack of capital.

TENANT FARMING.—Intimately connected with the problems already mentioned is the American system, or lack of system, of tenancy, as practiced in this locality. Cases differ in a great many characteristics, but among most of them may be found: (1) An absent landlord, and (2) a transient tenant; that is, one who stays but a year or two and then moves to another place. This system seems to combine all the bad points of all the systems in vogue to-day and to embody none of the good points of any. It is hard to localize the blame for this condition. Probably it should be laid to the system, rather than to either landlord or tenant; and the system should be considered as the natural result of the conditions under which the country has been developed. It must be changed before long, however, or much harm will result. Just now we have a landlord who squeezes the tenant in order to make a good profit on a large

investment, and a tenant who impoverishes the soil in an attempt to pay a large rent and make a profit. The landlord in nearly every case gives the tenant a poor dwelling. In the words of a tenant, "Anything is good enough for a renter to live in." More often than not he does not furnish sufficient



Peach Leaves, Attacked by Leaf-Curl, as Soon as They Push Out Beyond Bud Scales. Fig. 45.

shed-room for the tenant's crops, live stock and tools. As a result, some of them, usually the tools, must be taken care of in the "big shed." What wonder is it, under such conditions, that the tenant is always looking for a better place to rent? And why should he adopt and follow any system of permanent agriculture on a farm which he expects to leave in a year or two? If conditions are such that we must have tenantry, then we need some system of tenantry by which, as in England, tenants will remain for a long time on the same farms. In England it is not uncommon for a tenant farmer to be born and die on the same farm, and many landlords would no more think of dispossessing a tenant than would anyone in America think of dispossessing an owner. It does not seem to be the proper thing to introduce into this country any such radical system, but a few steps toward longer terms of tenancy certainly would improve conditions. The attainment of this end may be brought about by a better understanding of farm problems and of each other by both landlord and tenant. Failing this, a doubtful alternative seems to be found in legislation.

RETARDING FACTORS.—The three factors, then, which, during my brief stay, impressed me as being those which are retarding progress most in this neighborhood are poor roads, lack of adequate agricultural capital or credit, and the prevailing system of transient tenancy. All three of these factors are more or less amenable to treatment by legislation, and they should be attacked by both the National Congress and the State legislatures. We should be careful, however, not to insist too strenuously on immediate legislation. "Half-baked" laws often prove distinct failures. Let us insist, then, not on having laws passed at once, but on an immediate constructive study of the situation by the law-making bodies, to be followed in due time by wise laws. H. E. MERN.

Indiana.

THE PREVENTION OF PEACH LEAF-CURL.

Peach leaf-curl is a common fungus disease of the peach which attacks the foliage in early Spring. The affected foliage becomes much distorted and curled, and later turns brown and falls from the trees. In severe cases the trees may lose a great part of their foliage and fruit, thus greatly reducing the vigor of the trees. Where only a few leaves are affected the damage amounts to very little. The leaf-curl fungus is greatly favored by cold, damp weather at the time the peach trees are developing leaves. If warm, dry weather occurs during this period the damage from the disease will be slight.

The leaf-curl fungus is one of the easiest to control, as it is very susceptible to the effects of fungicides, and yet many failures to control it are reported each year, because the fungicides are not applied at the proper time. The disease remains in the orchard over Winter in the form of spores. These spores begin to germinate as soon as leaf bud development starts in early Spring, as illustrated in Fig. 45. As soon as the tips of the new leaves show beyond the bud scales they are open to the attack of the fungus. The feeding, or what may be called the root portion of the fungus, develops inside of the leaves of the peach, and after it is once established in this manner there is no way of destroying it without destroying the leaves.

The only successful method which will completely control the disease is a treatment which will destroy the spores before they have a chance to germinate and enter the tips of the new leaves just emerging from the protection of the bud scales in early Spring. Fortunately the lime-sulphur mixture as applied for the scale is a perfect remedy for this disease. The requirements for success, however, are that the lime-sulphur be of a strength sufficient to control the scale, that it be thoroughly applied, and that it be applied before the leaf buds have opened. Many peach growers failed to control the leaf-curl with lime-sulphur last Spring, because they failed to spray early enough. The abnormally warm weather started the leaf buds into growth very early, and the fungus was able to establish itself inside the leaves before any spray was applied. After the leaves have become curled it is too late to control the disease in any way for that season. To prevent injury from this disease the coming season, spray your peach trees thoroughly with lime-sulphur at the standard Winter strength before the leaf buds make any growth in early Spring. M. A. BLAKE.

New Jersey Experimental Station.

RADIUM AND CANCER.

The attempt to cure cancer with radium may be said to be fighting a mysterious disease with a no less mysterious remedy. An ancient disease, and now apparently increasing in prevalence, cancer is the enigma of modern medicine. Its physical structure is known but its cause and essential nature yet baffle science. All of the various structures of the body, whether of bone or softer tissue, are made up of cells, as a wall is made up of bricks. Each cell, like each brick, is an independent bit of matter which must be united with thousands of its fellows to form a useful structure. These cells are of microscopic size, and as the bricks in a wall are separated from each other by mortar, so is each cell enclosed in its own membrane. The similarity ends here, however, for the brick is a dead, inert thing, while the cell is a living mass, capable of growth and reproduction. As a young tissue grows, or a mature one wears out and needs to be replaced, these living bricks of which it is made increase in number and thus add to the bulk of the tissue, or maintain it at its normal size, being governed in this by that mysterious principle which we call life.

Sometimes, however, the bricks in some part of the body walls refuse to obey the rules of nature, and commence to grow and multiply in an utterly lawless way. When they do this, they form an unnatural enlargement, or tumor, and this particular kind of tumor we call cancer. Just why any group of bricks should break away from all restraint and commence a vicious growth, we do not know, and until we do know, we cannot say what causes cancer. These new and unneeded bricks, whether in skin, muscle, or some internal tissue, have little vitality, and tend to break down and ulcerate, producing the open sores seen in external cancers.

It has been found that that wonderful substance known as radium gives off certain emanations, or rays, which may be used to destroy these new cells in a cancerous growth without injuring the law abiding ones of healthy tissue. Like X-rays, they also have the power to penetrate healthy tissues to reach diseased ones beneath. They thus not only offer hope for the destruction of cancerous tissue upon the surface but also of that in interior parts of the body. It is necessary that radium be used in proper amounts and for a limited length of time, for if too long exposed to its action, healthy tissues will be destroyed. While all this is true, and the discovery of this beneficent action of radium offers great hope to humanity, there are still limitations to its use which should be generally known to prevent disappointment on the part of sufferers. The total amount of radium in the world is exceedingly small, and the process of extracting it from its ores almost infinitely slow and expensive. It will be months, or possibly years, yet before a sufficient quantity can be obtained and used to show just how far it can displace the surgeon's knife in the treatment of cancer.

Those eminent surgeons whose work with radium has recently aroused so much interest and hope urge most strongly that the early use of the knife must yet be depended upon to save the lives of cancer sufferers. While radium promises a great deal, it is still a promise, so far as its practical application is concerned. A cancerous growth, wherever situated, is, for a time at least, a local disease, and if it can be removed before it has spread its contagion to surrounding structures, it may be cured. This time is limited, however, and the earlier the appeal to the blessed knife of the skilled surgeon, the greater the chances of complete and permanent removal. M. B. D.

CHARGE "ALL THE TRAFFIC WILL BEAR."

I have been reading of the closing work of the New York State Legislature, and it gives me a feeling of "righteous indignation," or something worse. I refer to their allowing Governor Sulzer's lawyers $40,000 for their services in trying to keep him from being impeached, etc.; that makes $5,714.29 for each one of them if divided equally. That is more than I ever made in one year in my business life. One of these men was a schoolmate of mine, and I don't know that he was any brighter than several of the other boys at that time. It makes me think of what Cassius said to Brutus:

> "Now in the name of all the gods at once,
> Upon what meat doth this our Cæsar feed
> That he hath grown so great?"

I never swam the Tiber with him, but I could throw a ball, or run as fast, or jump as far as he, and sometimes recite my lessons better. He chose the law and I agriculture and horticulture. I believe it takes as much brains to run a fruit farm as it does to prove that a Governor of New York is honest, if it does not pay as well. Thirty-five years ago I was settling up an estate, and some one had to appear for two minors who were heirs. The judge called in an attorney from across the hall, and he spent about five minutes doing up the job. The judge remarked that the law allowed him five dollars for it. I turned around and looked out of the window and saw a man working on the street, and when I went out I asked him how much he was getting a day, and he said one dollar. Now I know there was as much brains on the street as there was inside. These are some of the causes that have led to the "high cost of living." I wish that a commission could be appointed that would bring out the real facts in the case. T. H. KING.

We understand these lawyers demanded $60,000, but were cut down one-third. The lawyers on the other side were paid still more for about a month's work. Any man who does business involving the transfer of property or the protection of property rights will find himself held up as by a highwayman for legal fees. We have one piece of property that has been "searched" four times in 10 years. The lawyers merely looked over the records, which were on file, and charged $15 or $25, as suited them. Even the notorious and guilty Allds, who was tried for

Peach Twig with Leaf-Curl. Fig. 46.

bribery and convicted, had the nerve to ask the State to pay his lawyers some $25,000. For a wonder the Legislature refused! Mr. King is right. These outrageous and unjust legal fees are among the "high cost of living" causes.

CRITICISM OF CONCRETE MIXER.

I would like to offer a little criticism of that barrel concrete mixer which R. P. C. recommends to F. M. H. on page 43. From my experience in mixing concrete I should say that the whole thing was decidedly impractical. For convenience cement is handled almost wholly in bags, and experience has taught me that it does not pay to mix it at one time, less than a one-bag batch; cement being packed closely in bags and barrels, when we try to divide the original package we do not get the division very accurate. One-half or one-third means almost anything to the ordinary laborer. Take a one-bag batch of a standard 1-2-4 mixture, and it contains around 6.6 cubic feet before mixing, and around 4.5 cubic feet after mixing. This would fill the barrel up pretty well when first put in, and as mixing progressed would settle considerably. A batch of this size would weigh over 600 pounds when mixed. Now let us start at the bottom of this thing and work up. Is that hinged bottom going to be strong enough to hold 600 pounds, and fit snug enough to prevent the water from running out and taking much of the fine cement with it before mixing is completed? I hardly think so. Anything as heavy and dense as concrete is going to stir mighty hard in the bottom of a barrel, and I venture to predict that with a pulley of relative size, as shown in cut, and with one bearing only, as shown, there will be a balk. It seems to me that the pulley would be somewhat in the way when putting material in mixer. As near as I can figure it, the top of that barrel will be around five feet from the ground, and this would make filling a slow and tedious job, especially if the wind were blowing your way when putting in cement.

R. P. C. says: "After every batch is mixed and dumped, the whole machine should be washed out before the next batch is mixed." I agree with him that this would be necessary, and this very fact helps to make the whole thing impractical, as it would consume too much time and water. In the majority of cases where concreting is done around the farm water is not found on the job superabundantly, but has to be carted from a greater or less distance, and therefore costs money. Home-made mixers are not as a rule very satisfactory. They have to be made strong and braced much to stand the strain, and the final cost in time and money is much more than at first calculated. F. M. H. would better let his engine rest under the shed and make a mixing platform 10x12 feet, using either square edge or tongued and grooved stuff. Do not use ship-lap. Nail a 2x2 strip around edge to prevent waste, and set level. Get three or four iron wheelbarrows and some square-pointed shovels, and I will guarantee that the same gang of men will mix more concrete in a day, and do it easier, than they can with any home-made machine mixer, even if it does run with power. I have been "through the mill" both ways, and have paid for my experience.

Rhode Island. MAURICE E. KENT.

CONTRACT FOR PRODUCE.

Will you let me know whether the inclosed contract asking that party of first part sell tomatoes to party of second part only is a legal contract or not? The canners have drawn up similar contracts in years past, and I would like to know whether they can hold them or not. P.

The contract mentioned seems to be an agreement for marketing or handling crops. We print sections of it below, as many similar contracts are drawn up in this one-sided manner. In a cooperative society of farmers, where control was in the hands of trusted people, such a jug-handled agreement might perhaps be considered, but it gives all the advantage to the people who handle the goods and none to the producers:

For and in consideration of the promise and agreement of the party of the second part to act as agent for the party of the first part in a manner and under terms and conditions hereinafter stated, the said party of the first part hereby promises and agrees to plant or sow, raise to a marketable size or condition and deliver during the year 191...., at the proper season, at such time and place as the party of the second part may direct, all the produce of the following:

.....Acres Corn.
.....Acres Peas.
.....Acres Beans.
.....Acres Cherries
.....Acres Tomatoes.
.....Acres Table Beets.
.....Acres Strawberries
.....Acres Red Raspberries
.....Acres Black Raspberries.
.....Acres .....

The party of the first part further agrees that the party of the second part shall be his exclusive agent for the sale of the produce herein mentioned.

The party of the first part further agrees that he will not contract for the raising and sale, or sell or contract to sell any tomatoes with or to any canner or preserver during the term of this contract.

The party of the second part agrees to act as agent for the party of the first part and to receive and sell the said produce at the best obtainable price, either to a cannery or in the open market and to make returns to the first party of the full amount of the net price received for said produce, less the commission established by the by-laws of the said second party, within ten days after the receipt thereof by the party of the second part.

It is further agreed that all produce marketed at canneries shall conform to the standard and conditions as set forth in the contracts made between said canneries and the party of the second part, and that the party of the first part shall grade and pack all produce sold in the open market in such manner as shall be prescribed by the party of the second part.

This is probably a legal and an enforceable contract if both parties sign it, but it is such a one-sided affair that a farmer should think twice before binding himself to all the provisions of this contract and get in exchange merely some one to act as his commission merchant—with no provision on behalf of the farmer to discontinue sending produce where the company fails to remit or is unsatisfactory in other ways. An examination of the contract discloses that:

The company promises and agrees:

1. To act as agent.
2. To receive and sell produce at best obtainable price.
3. To make returns of net price less commissions to farmers within 10 days after receipt.

THE KING ROAD SCRAPER IN OPERATION. FIG. 47.

The farmer promises and agrees:

1. Plant and raise to marketable size and deliver the fruit, etc., named.
2. Deliver at proper season.
3. Deliver at time and place directed by company.
4. To deliver *all* the produce mentioned in contract.
5. Makes company exclusive agent of sale.
6. Not to contract to raise and sell tomatoes to any canner or preserver.
7. Not to sell any tomatoes to any canner or preserver.
8. To make his produce for canneries conform to requirements of a contract between third parties, to wit: company and canneries.
9. To grade and pack market produce as prescribed by the company.

Contract fails to state:

1. What company's commission will be. This is governed by its by-laws, and may be as high as 25 per cent. for all the farmer knows.
2. What is to be done with the produce raised by farmer and not acceptable to company as too small, etc. Farmer cannot sell this to anyone as contract calls for "all the produce."
3. What the advantage to the farmer is in promising all these things on his part for the privilege of merely having a company act as his commission agent.
4. What will happen if the company does not make returns within ten days. Farmer must still deliver the goods.
5. What will happen if the company does not seek nor obtain the highest market price. What remedy has the farmer?

MOST of the farm credit plans are rightly based on the proposition of enabling a man with some property to use it for credit. But where does the tenant farmer or man without property come in?

TUNING UP A DRY CELL BATTERY.

Will you tell me what is used and in what proportions in a dry battery to make it react? Also how much zinc, copper and vitriol or sulphuric acid shall I need in a 10-gallon gravity battery? What voltage would it give? How much could I expect from the reacting dry battery? I. A. B.

Pennellville, N. Y.

1. An old dry battery which has run down is not worth bothering with, for there is nothing that will give it a new life for long enough to pay for working on it. Frequently, however, if you are stuck wtih the old batteries and can't get any more, while you must have current, heating the batteries will make them work a short time. For example, if you are caught out in a motor boat and the batteries run out, heating them over the exhaust might liven them up enough to make the run in. The battery originally is made in any one of a dozen ways. There are a couple of hundred patents on dry batteries. One of the simplest constructions is to line a zinc cylinder with a thin layer of paste made of the following: Three parts plaster of paris; one part sal ammoniac; one part zinc chloride; one part flour; two parts water. The voltage of the dry battery will be about 1½ volts. Suspend a carbon free from the coating on all sides and fill the space around it and between it and this paste with the following mixture: one part sal ammoniac; three parts manganese peroxide; one-tenth part powdered charcoal; four parts powdered charcoal. Small amount of water.

2. I cannot imagine what you would use such a large gravity battery for. It would give the same voltage as one of the ordinary one-half gallon size. The voltage of any battery is entirely independent of its size. One the size of a thimble will give the same voltage as one the size of a barrel. The capacity of the larger one is greater, however. That is, you can draw the same current for a much longer time. If you want to get a higher voltage, it will be necessary to make a number of batteries. Each battery will give a voltage of about one volt (more exactly 1.08 volts), and if, say, six are connected "in series," that is, the zinc of one to the copper of the next, the voltage will be six times as great. If the six zincs are connected and the six coppers are connected, the voltage will be only one volt, but the effect will be the same as though there was but one battery six times as large as any one. This is known as "parallel" or "multiple" connection. The zincs and coppers may be any size. The copper keeps getting larger but the zinc is gradually eaten up. The copper is placed at the bottom and the zinc at the top. Copper sulphate crystals are placed in the bottom of the jar and water added to cover the zinc. The water is usually slightly acidified with a few drops of sulphuric acid. About a pound of crystals to a gallon of water will give a good solution. After allowing the battery to stand short-circuited for a time, it will be found that the top of the liquid is light colored. It has become zinc sulphate because the sulphuric acid has attacked the zinc. The dividing line between the zinc sulphate and the copper sulphate should be kept about half way between the copper and the zinc. If it falls lower add crystals and water, after taking out a little of the zinc sulphate. If it goes higher either short-circuit the battery for a little while or add a drop or two of sulphuric acid. R. P. C.

SILICATE OF SODA IN CISTERN.

In your issue of December 6 you recommend solution of silicate of soda wash to remedy leaks in a cistern. Will you inform me whether the silicate of soda affects the water for drinking purposes, or is likely to cause rusting of the inside of iron supply pipes conducting the water from the cistern to the house?

Smithtown Branch, N. Y. J. B. P.

Silicate of soda is not soluble in cold water, and will have no effect on drinking water nor on the iron supply pipes. It is readily dissolved by acidified water, however, and is quite frequently found in mineral waters used for drinking purposes. In moderate quantities it does no harm and, in fact, is prescribed for certain ailments. I find that the waterproofing of a cistern already built is a difficult one to solve. Nothing is permanently successful, but all of the waterproof coatings are of some value. The remedy, of course, is to make the job of a first-class, rich concrete mixture well worked over and carefully laid. Building a concrete cistern requires especial care in preparing and mixing material. R. P. C.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Young Man's Wages,

Please state what wages a young man of 18 expects, to work by month on a farm, board and washing included, and if he cares to work by month or year.
Canaadea, N. Y. J. K.

What is a horse worth? What would such a young man earn as a blacksmith or barber? It would depend upon his skill or experience. Is this man strong and big or small and slender? What does he know about farming? Can he plow and milk and does he know how to do all farm work? You see how impossible it is to answer such a question without knowing the man. We could not settle such a matter as between farmer and man. In our country such a man would receive all the way from $15 to $30 per month, depending on what he could do.

Apple Varieties for Michigan.

I am expecting to plant about 800 peaches, 200 apples and 100 cherries. The land I expect to use is a light sandy soil, has been run for several years and is exhausted of its humus. It lies on the west side of a lake covering about a section; has a very good elevation and is well drained. Will the trees above named do well on this soil? Will they need a fertilizer, and what kind? What varieties would you advise, with the idea of planting the same number of trees each year for the next three years? Would you advise using one or two-year-old trees, and what size would be best?
White Pigeon, Mich. E. R.

It would seem that the location and soil described ought to be suitable for growing the fruits named, but as it is in a rundown condition it will need to be brought up to a productive state. This can be done by using stimulating fertilizers to grow cow peas, Soy beans, vetch and other legumes which will add humus and nitrogen to the soil. All the stable manure that can be got and applied at a low price will pay to use in enriching the soil until the soil improving crops can be grown and worked into it. Almost any standard brand of mixed fertilizer will serve the purpose of invigorating these crops and the trees as well. Only first-class trees of any age should be planted. It is not essential whether one or two-year-old apple trees are bought, but one-year-old peach and cherry trees are the best. The varieties that succeed commercially on the best paying farms, these may be the best to plant, but some of the newer kinds may be equally good or better. Northern Spy is a standard for that region and although the trees do not bear early, there is profit in growing them. Baldwin and R. I. Greening are also standards and might be included. Among the newer kinds McIntosh, Akin and Delicious are excellent and I would suggest using all of them in considerable numbers. If the filler system is used there should be some of the very early bearers planted, to be cut out when their space is needed. Yellow Transparent, Oldenburg, Wealthy and Wagener are of this class. I would not plant peach trees as fillers, because of the damage they do to the apple trees by robbing them of moisture and fertility from their very greedy manner of growth. The permanent apple trees should be 50 feet apart, and the fillers would make the complete orchard stand 25x25 feet apart. This is about right for peach and cherry trees too. The peach trees will not really need that much room and they might be set as close as 18 feet apart. Cherry trees live much longer and grow to much larger size and will need half of them cut out within 15 to 20 years, whether they are of the sweet or sour class.

As to the varieties of the peach to plant, the Elberta should be included, because of its fine market qualities. The new J. H. Hale peach is a good one, as I know from careful tests for two years past. A variety known in Michigan as "Red Chili" is one of the very best of the yellow peaches for general use and yields well. Smock and Salway are good late varieties.

Of cherries the Montmorency is the most profitable of all the sour varieties. Richmond is good for a nearby market, but not for shipping. Both of them sell well at the canneries. Schmidt is the most profitable of the sweet and hard-fleshed varieties. Late Duke and Napoleon are also good. All the sweet varieties should be budded on Mazzard stocks, and the sour ones on Mahaleb.
H. E. VAN DEMAN.

Onions for Seed.

Which are the best onions to grow for seed, the sets or large onions grown from seed, say season of 1913? What is the usual method for shelling or thrashing the seed and grading? T. S. B.
Akron, O.

In the production of seed of any kind, if we wish to maintain and improve the type, and keep a variety pure, we must get seed from the best specimens of the plant. Onions are grown for the bulbs, and they vary with the shape, color and other characteristics of the varieties. Hence to get good and true seed, we must take the matured bulbs in order to find the typical ones. Sets of some kinds of onions might run to seed, but sets of other varieties would simply develop a bulb full grown and ripen. The time to make the selection of onions for seed is at the time of harvesting the crop. The pure types of the varieties can then be better seen than later. No thick-neck bulbs should be used. The bulbs may be planted in the Fall in localities where the climate is not too severe, and the California seed crop is always planted in the Fall. For seed production soil with an excess of nitrogen from animal manures should be avoided, and only commercial fertilizer used, and this mainly of phosphates and potash. The select bulbs should be set in furrows about 16 inches apart, and deep enough to cover the top of the bulbs about two inches. As the seed stalks develop they should have the soil worked to them as a support, but sometimes twine is stretched along the rows attached to short stakes, the twine passing on both sides of the line of stalks. There will be some inequality in the ripening of the heads, and they are gathered as the stalks turn yellow. They can be gathered up in cotton sheets to prevent loss, and spread out on a tight floor under cover to dry. The seed can be flailed out and run through a fanning mill to blow out the chaff. To secure the best seed only, put them a few at a time in a vessel of water, and stir it, and then save only those that sink, skimming off all that float, and then spreading out the good ones to dry in the shade. Where grown on a large scale doubtless more labor-saving implements are used, but I have simply told what anyone can do on a small scale. Certain varieties of onions mature best in certain climates. The seed of the so-called Bermuda onions is all grown on the Island of Teneriffe and nowhere else that I know of. The Spanish and Italian sorts are either imported or grown in California, and the New England varieties in New England, and probably would thrive and mature well all along the Lake region.
W. F. MASSEY.

Start Your Garden Early

Don't be satisfied with the usual method of outdoor planting. It means a short season and ripe produce only when prices are lowest.

Market gardeners make bigger profits on early produce by planting seeds in February in **LUTTON MINIATURE GLASS GARDENS.**

You, too, can make a handsome return on early tomatoes and twenty other varieties of vegetables, both in and out of season, if you invest a few dollars and a little effort in **LUTTON SASH FRAMES** now.

These frames are made in one, two, three and four sash sizes; each sash 3 ft. x 6 ft., single or double glazed. Sold with or without sash. Carefully crated and shipped ready to use. Write for descriptive pamphlet D. Planting instructions furnished free.

WILLIAM H. LUTTON
223-5 Kearney Avenue Jersey City, N. J.

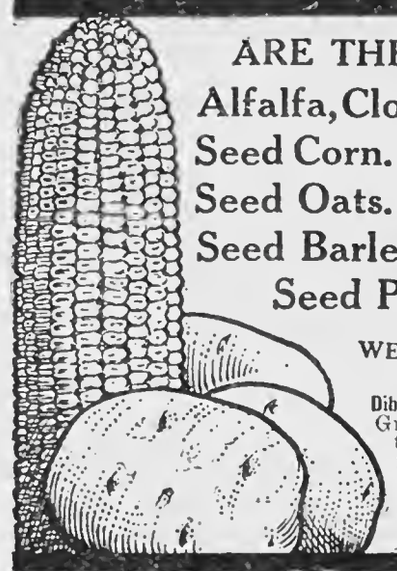
Medium and Mammoth Clover—grown in the Miami Valley. Also Alfalfa, hardy Northern non-irrigated seed. All high in germination and purity tests. Prices and samples freely furnished. **MACE & MANSFIELD, Greenville, Ohio**

POTATOES—Beauty, Bliss, Bovee, Carman, Giant, Hustler, Rose Green Mt., Ohio, Swiftsure. 85 kinds. C.W. Ford, Fishers, N.Y.

THE DOUGLAS PEAR ON TRIAL

The best New Fruit before the public. Introduced by A. H. Griesa. "THE PINES," R. 5, Lawrence, Kansas

DIBBLE'S FARM SEEDS



ARE THE BEST MONEY CAN BUY

Alfalfa, Clover, Timothy Seed, D.B. Brand. 99.50% pure or better.
Seed Corn. Best Flint and Dent varieties, either for crop or the Silo. Germination tests to date average over 95%.
Seed Oats. Two splendid varieties, early, very productive with grain, weighing 40-45 pounds per bushel.
Seed Barley. The kinds proven best by test for the Middle States.
Seed Potatoes. Thirty-two varieties best early, intermediate and late, in any quantities from barrels to car loads.

WE ARE HEADQUARTERS FOR FARM SEEDS.
OVER 100,000 BUSHELS IN STOCK

Dibble's Catalog and 10 sample packages of Dibble's High Grade Farm Seeds for testing, mailed absolutely FREE to any farmer who asks for them. Please mention the number of acres you are farming, in writing. Address
EDWARD F. DIBBLE SEEDGROWER
Box B Honeoye Falls, New York

FROM OUR FARMS TO YOURS

EVERYTHING for the GARDEN

is the title of our 1914 catalogue—the most beautiful and complete horticultural publication of the day—really a book of 204 pages, 14 colored plates and over 800 photo engravings, showing actual results without exaggeration. It is a mine of information of everything in Gardening, either for pleasure or profit, and embodies the results of over sixty-seven years of practical experience. To give this catalogue the largest possible distribution we make the following liberal offer:

Every Empty Envelope Counts As Cash

To every one who will state where this advertisement was seen and who encloses Ten Cents we will mail the catalogue

And Also Send
Our Famous 50c "HENDERSON" COLLECTION OF SEEDS

Containing one package each of Ponderosa Tomato, Big Boston Lettuce, White Tipped Scarlet Radish, Henderson's Invincible Asters, Mammoth Butterfly Pansies and Giant Spencer Sweet Peas, in a coupon envelope, which, when emptied and returned, will be accepted as a 25-cent cash payment on any order amounting to $1.00 and upward. With the Henderson Collection will be sent complete cultural directions, together with the Henderson Garden Plans.

PETER HENDERSON & CO. 35 & 37 CORTLANDT ST. NEW YORK CITY

Burning Fruit Trees

There is a large percentage of every block of Fruit Trees that is offered for a few cents per tree that does not pay the Nurserymen, and does not pay the Planter. To avoid disappointment and loss to both parties we—**burn them up!** We are offering only **first-class Trees**—send for our Free illustrated descriptive Catalog, 54 pages, and see if you can't get **Fresh dug Trees** as cheap as cold storage stuff—40th year of trees from our Nurseries direct to the planter.

G. C. STONE, Nurseryman
DANSVILLE -:- NEW YORK

Wilson's Seed Annual

A new book by a seedsman who spent years in learning the varieties best suited for the average garden. I know that many sorts are worthless for general planting, so I have put into my book only the kinds that I know will grow and produce vegetables and flowers for the home- or market-garden. Send today for a free copy—and have a successful garden this year.

The Home Acre.

Girdling Apple Trees.

Will you tell me the date to girdle apple trees that are about 15 years old? They set a large crop of fruit, but drop it later. These are old dry-land trees, that were placed under irrigation four years ago, and have grown remarkably well, but are not bearing as much fruit as they should. The varieties are Northern Spy and Bellflower. W. H. E.

Coeur d'Alene, Idaho.

The trees should be in the full flush of their growth to be in fit condition for peeling their trunks to induce bearing. The month of June is usually about right time. There is then forming between the bark and wood the annual layers or additions to both, which is made from the shiny matter that is then very abundant there and the reason there is no injury from taking off the bark is because of this fact. There is a slight checking of the growth, and this causes the formation of more fruit buds than would naturally occur. The quick formation of new coat of bark protects the delicate tissues from the drying influences of the air, and the natural functions of the tree go on almost undisturbed. The Northern Spy and Yellow Bellflower are varieties of the apple that do not always bear abundantly, but as fruit trees in Idaho usually bear too much rather than too little fruit it is scarcely necessary to use artificial means there to cause trees to bear better that are 15 years old. However, it will not hurt the trees to girdle them in June. H. E. V. D.

Fruits for the Home Acre.

I think it would be a great boon to suburbanites like myself with small garden of an acre or so, to publish a chart of the various fruit trees, dwarfs and standards, showing when they might be expected to bear fruit from the time of planting. I read of various kinds of apples, for instance, or cherries, that they are earlier bearers, but there is nothing to tell me whether I might expect a sample of fruit in two or six years from planting. I put in some dwarf pears two years ago, and the Duchess trees have given me two pears each year, the Wilder and Anjou I haven't heard from.

Dunellen, N. J. A. C.

The suburbanites who have small orchards or fruit gardens and who are interested in giving them personal attention deserve to be helped by information that will be of real use to them. They may get a great deal of health and pleasure and plants that can be grown on a small lot. There are books that will be of much assistance in this work, some of which give lists of varieties that are suited to certain climates and soils. Among these books there are many that are not up-to-date in the matter of varieties, but their advice and directions are generally good. The catalogues are not always edited with the intelligence and accuracy that they deserve, and sometimes there are exaggerations and overpraising of varieties, but there is much in them that is of real value to the planter.

To prepare lists of varieties that are in the habit of bearing early and are of high quality might be of much benefit to the amateur growers of fruits, but to cover the whole range of territory where these people live there would need to be different lists to suit the various conditions of climate and soil. As to the exact age at which the different varieties would begin to bear on both standard and dwarf stocks would be a most particular job and would probably lead to frequent disappointments. So much depends on the soils, diseases and insects to be contended with and the treatment the trees get that predictions as to results might be far from correct.

In regard to dwarf fruit trees there is much difference of opinion but they usually hasten the bearing of the varieties, and they certainly occupy less space than standard trees, and are, therefore, valuable for small places. Dwarf pear trees are usually quite practical and dwarf apple trees are so to a considerable degree, but there are very few other fruits that have been successfully dwarfed. The average suburban dwellers will learn more of a practical nature about fruit growing by visiting those of his neighbors who are succeeding and following their suggestions than by studying books and catalogues. It is all right to study them but not to let the other go undone.

FRUITS FOR HOME GARDENS.—Arranged, approximately, in order of ripening:

Apples.—Yellow Transparent, Red June, Williams, Fanny, Golden Sweet, Primate, Jefferis, Fall Pippin, Gravenstein, Melon, Grimes, Jonathan, Delicious, Hubbardston, Stayman, McIntosh, Akin, Stark.

Pears.—Wilder, Madeline, Tyson, Howell, Boussock, Bartlett, Seckel, Sheldon, Dana's Hovey, Lawrence, Easter.

Peaches.—Sneed, Red Bird, Greensboro, Mamie Ross, Carman, Alton, Early Elberta, Hiley, Elberta, Reeves, Illinois, Sea Eagle, Heath Cling, Salway, Krummel.

Plums.—America, Omaha, Abundance, Wickson, Gold, York State Prune, French Damson.

Cherries.—Richmond, Dyehouse, Purple Gean, Tartarian, Late Duke, Montmorency, English Morello.

Quinces.—Orange, Meech, Van Deman, Champion.

Grapes.—Campbell, Winchell, Delaware, Concord, Brighton, Lutie, Niagara, Eclipse.

Strawberries.—Climax, Warfield, Chesapeake, Aroma, Haverland, Dunlap, Gandy.

Raspberries.—King, Plum Farmer, Cuthbert, Cumberland.

Blackberries.—Early Harvest, Blowers, Eldorado, Agawam.

Gooseberries.—Downing, Pearl, Champion.

Currants.—Perfection, Diploma, Red Cross.

Dewberries.—Mayes (Austin), Lucretia. H. E. VAN DEMAN.

FLORAL NOTES.

If you have the space, now is the time to get geraniums from your florist for use on Decoration Day. The price now will be just about one-half. They will not be in bloom now and will be in small pots and if you get them they must be kept in a cool, light window, washed and turned frequently and along in March put into four-inch pots. On calm warm days in April get them out of doors a little to become hardened, as they will drop their leaves if put out from the house with no previous hardening.

If you want to take slips of any of your house plants, now is a good time to do it, but as most cuttings require a good temperature to throw out roots, a few expedients will have to be resorted to to induce growth. At this season I use either a glass of water or a saucer of slushy sand. Nearly any common house plant that will root at all from slips will root in a glass of water. Take slips that break from the old plant sharply; if they bend clear over without breaking the slip is not in the right condition to make growth. Place all your cuttings in tepid water and set high up in a sunny window. If possible, in each glass put a few slips of wandering Jew. These root in a very few days and their growth has a tendency to keep the water pure until the other cuttings are rooted. At night set the glasses out of the window to a place near the stove, preferably on a shelf, but not lower than a chair. In the morning pour out a little of the water and replace with warm. Cuttings from the rose and walnut geranium root very slowly, taking as much as two months often. Do not give them up unless you see signs of decay. In potting such cuttings, see that the earth is warm and kept warm until well established. It is best to use small pots first, as flowers are induced by limited root space. This applies especially to geraniums.

The single varieties of bedding Petunias make fine house plants. Seed can be planted now or any time in warm earth. It will germinate quickly and the plants make astonishing growth. When a few inches high pinch out the top so branches will start. Allow about three branches to a plant and train these on a neat trellis in the window. I have seen such Petunias in windows in bloom for months, one or two plants filling the entire space and bearing dozens of flowers at a time. The common morning-glory makes another novel and charming window plant, coming into bloom after the first few leaves have formed. In this respect its blooming habit is entirely different from outdoors, where the vine is many feet high before blooming. P. L. W.

Michigan.

The Mapes Fertilizer Company

A Business Characterized by Stability and Progress

Under the Same Family Management for Three Generations

NOT only have the Mapeses continued successively in the business for three generations—grandfather, father and son, but the Lanes, who have been associated with the Mapeses from the start, show the same identical record—grandfather, father and son.

Could there be a better guarantee than this family management, with the element of family pride deeply involved, that everything has been done and will continue to be done to make the Mapes Manures as good as the present knowledge of fertilizer science permits for the crops for which they are intended?

The Mapes business had its inception in the scientific research and experiments of Professor James J. Mapes, and scientific research and experiment, coupled with the most exact practical experience, have been the dominating factor in the Mapes business to the present day.

Catalpa Tree Agents Lose.

There were lively times among the farmers around Batavia, N. Y., last week, over the lawsuit brought by Burt Walton of Indiana, against James Pettibone of Batavia. This was a case involving a tree agent transaction. Walton is an agent for the sale of Catalpa trees. He sold the trees grown by the Tippecanoe Nursery Co., and appears to have told all varieties of guff in his efforts to obtain contracts. A number of farmers bought the trees on the strength of what Walton told them, and then learned on good authority that his stories were greatly exaggerated, and that the trees are not suitable for planting in New York State. Mr. Pettibone, it is said, bought 2,000 trees, and when he learned the facts refused to pay for them, so Walton brought suit to recover $40. The farmers around Batavia became interested in the matter, and formed an organization of some 300 members. They joined together to resist payment for these Catalpa trees, engaged lawyers, and put up a defense fund. Their point was that Walton misrepresented trees, and got them to take a lot of stuff which was practically worthless for growing in New York State.

There was a big legal battle over this matter, for it means a lot both to the nursery agents who depend on guff for making their sales, and also to farmers who have been buncoed into buying worthless stuff. The case was brought before a justice of the peace and six jurymen, and was fought out through four days. Walton testified that he paid $3 to $3.50 a thousand for the trees, and sold them for $20 and $25, and he undertook to prove by his witnesses that the trees were suitable for planting in this State. The defense produced such witnesses as Prof. H. P. Baker, of the School of Forestry, and other well-known scientists, who showed clearly that this tree is not suitable for planting here. Many farmers testified to the quality of the guff which Walton had given them in trying to sell the trees. The jury was out 15 minutes, and returned a verdict for Mr. Pettibone, and it is rumored that Walton may be arrested and prosecuted for misrepresenting the trees when he tried to sell them. It is a singular thing, but the jurymen received only 50 cents apiece for their four day's work. It was suggested by some of the farmers that they raise a purse of money and give it to the jurymen, but this was very properly stopped by the officers of the farmers' organization, for it would have been a great mistake to establish any such precedent in a case of this sort. This legal battle was a timely one, and would seem to settle the question of responsibility when a tree agent misrepresents his goods and obtains his contract in any such way.

Sweet Clover in New York State.

Is Sweet clover grown as a cultivated crop in New York; if so, has it proved satisfactory? J. B.

I do not know of Sweet clover being grown in this county as a regular farm crop. I have observed a few lone plants by roadsides and in waste places, in which case the plants seem to thrive and to attain good size. There is a question in my mind, however, as to whether this plant would be good for fodder in the case of dairy cattle, because of its extremely woody structure due to its habit of growth. I am wondering if in buying Sweet clover seed one would not be apt to get Southern grown seed, or a seed which would not be adapted to our Northern climate. We find this objection extremely emphasized in the buying of Alfalfa seed, endeavoring to get a seed that is adapted to our Cattaraugus County farming. At present, as I stated above, Sweet clover is not being grown by the farmers in Cattaraugus County, nor have I heard the subject agitated to any extent.

HERMAN K. CROFOOT.
Cattaraugus Co. County Agent.

I do not know of any farmers in this county who have tried Sweet clover sufficiently to answer this question. Neither have I seen any indications as to the probable outcome of growing Sweet clover. G. P. SCOVILLE,
Onondaga County. S. A. MARTIN,

I do not know of a single instance where Sweet clover is being grown.
Oudaga County. S. A. MARTIN,
County Agent.

I do not know of a single field of Sweet clover growing in this county; there are certain sections of the county where it grows along the roadside very well, also in several places along the railroads. Several persons have said to me that they were going to try it out in a small way next year. The Farm Bureau has advised them to try it only experimentally at first, for we believe that Alfalfa is the better crop, and will grow in any place that Sweet clover will thrive.

W. L. MARKHAM,
Wyoming County. County Agent.

I have seen very little of it growing in Broome County during the last year. It is not generally adapted to the hill soils of this region, because these soils are more or less deficient in lime. In the river valleys there is more lime in the subsoil, owing to the deposits of glacial drift, but even on these soils we need lime to make Red clover and Alfalfa succeed. I have not encouraged anyone to grow Sweet clover here, and have seen it growing in only one or two favored places. In my judgment it needs lime fully as much as Alfalfa to make it succeed. I have been told by one man during the year that he obtained an excellent stand of Sweet clover one season, but that it was completely killed by the Winter. I do not know how to explain this statement. E. R. MINNS.
Broome County.

There is no Sweet clover grown in this county to my knowledge, except what was sown under the direction of our bureau during the past Summer. One farmer sowed five acres of Sweet clover with barley. The seeding seemed very satisfactory last Fall, and I will advise you in the Spring if it comes through the Winter all right. Sweet clover seems to do well in this section on the soils adapted to it, and I have observed that where it has been cut along the roadsides about the time of the first cutting of Alfalfa a large second growth has been obtained. The farmers tell me that their cows will not touch the clover in their pastures until the other feed gets short, but when they do commence to pasture on it, will graze it down very closely. In reference to the soils, upon which Sweet clover grows, will say that it seems in this section to be best adapted to gravelly soils. In fact, I do not know of any Sweet clover growing naturally on other than gravelly soils, and it is my opinion that the presence of lime is of more importance to fertility, as it seems to grow on what might almost be called gravel heaps along creeks which run over limestone ledges. I am very much interested in the growth of this plant, and expect to do more work in experimenting with it during the next Summer.

M. E. CHUBBUCK,
Herkimer Co. County Agent.

The growing of Sweet clover (Melilotus alba) in Jefferson County has not reached any importance as an agricultural crop as yet, although the plant grows wild along the roadsides, creek sides, and other rough places throughout the greater part of the county. To state the present condition more correctly, the farmers have always considered this plant a weed, and even though it is a hardy legume, steps have never been taken, to any extent, to utilize it as a forage plant. In a limited degree some of our farmers have sown Sweet clover seed on their rough, hawkweed-infested pastures, hoping to get the plant established there. In most instances this seed has been sown late in the Spring, although it is known that the natural time for self seeding of this plant is in the Fall. Hence we have nothing, at this time, to report in favor of the use of Sweet clover in connection with pasture improvement, although the plan would seem feasible. One of our farmers seeded several acres of Sweet clover with grain, as one would grass seed and clover, but owing to a very dry season and perhaps to seed of poor germinating power, the stand of Sweet clover on this field is not remarkable. We are planning to give this plant a thorough trial during the coming year. As mentioned above, as yet we have nothing remarkable to report in favor of Sweet clover, neither have we any evidence that it will not make a valuable crop for this county where the growing of Alfalfa is a gamble. F. E. ROBERTSON,
Jefferson County. County Agent.

Hungarian Grass.

Will Hungarian grass thrive in this section? How much should I sow to the acre? Is it true that it is only an eight-week crop? Would it be advisable to sow any other crop with it, if so, what kind? When is the best time to get it in?
Dutchess Co., N. Y. W. O. T.

The millets will thrive in your section. The Japanese Barnyard millet will most likely suit you better than Hungarian. We think it best of the millets. About 20 pounds of seed to the acre and you should allow 10 weeks for its development. Do not seed with millet, but use it to give a crop of fodder between a Spring and a Winter grain crop.

THE JUDGE: "What proof have you that this chauffeur was intoxicated?" The Country Policeman: "He stopped his car at a drinking-trough for horses."—Toronto Sun.

LITTLE Freddie reached the mature age of three, and discarded petticoats for knickerbockers. "Ah," cried the proud mother, "now you are a little man!" The fledgling was in ecstasies. Displaying his garments to their full advantage, he edged closer to his mother, and whispered, "Mummie, can I call pa Bill now?"—Bristol Times.

At Last! A *Perfect* Home Lighting System

Now the time of poorly lighted home is over. You can easily, cheaply and safely flood your home with brilliant, perfect light just as you have always wanted to. NIGHT DAYLIGHT has solved the problem—*and it is within your reach right now.*

Here's Proof —READ!

Plainville, Conn.
Superior Mfg. Co., Ann Arbor, Mich.
Gentlemen: I have had one of your lighting systems for six years and if I could not get another like it I would not take ten times what I paid for it today. Yours very truly, Harry Tyler.

Fowlerville, Mich.
Superior Mfg. Co., Ann Arbor, Mich.
Gentlemen: We have purchased one of your systems and the people around this vicinity are greatly interested. We purchased our system in Howell and we also are greatly pleased with it. Please send me one of your catalogs. Yours truly.
Eugene Bell.

Fairbury, Neb.
Gentlemen: The system is O. K. and we use it every day. They are more than satisfactory. We also have a couple of systems here that are perfect. Yours truly, Fred Shannon.

Pitcher, N. Y.
Superior Mfg. Co., Ann Arbor, Mich.
Gentlemen: I wish to tell you about the system I bought of you. The same mantle is on one lamp that came with the lamp when I bought it, over a year ago, and if I had not had an accident the other one would be all right now. There are a number of systems in use in this section but I like yours the best of all. They give us so little trouble.
Yours very truly, H. D. Fairchild.

Bristolville, Ohio.
Superior Mfg. Co., Ann Arbor, Mich.
Gentlemen: I have used one of your systems for about seven years and it has given perfect satisfaction. Will you please send me your latest catalog and oblige. Yours truly, Mrs. Nettie Lewis.

Briggsville, Wis.
Superior Mfg. Co., Ann Arbor, Mich.
Gentlemen: Yours of November 8th at hand. I have been shouting at my neighbors all summer to light and not be 20 years behind times, and have a nice white light you can see to read with. Quite a few of them say they will put them in this winter. Please send me a new catalog.
Yours truly, W. Mylrea.

Ashby, Minn.
Superior Mfg. Co., Ann Arbor, Mich.
Gentlemen: Yours of November 1st at hand. Can say I have now had your system in my house for over half a year and it gives perfect satisfaction and would not lose it for twice the price. Have received many compliments from my neighbors on it.
Respectfully yours, Henry Thompson.

Midway, B. C.
Superior Mfg. Co., Ann Arbor, Mich.
Gentlemen: Received the catalog and fixtures O. K. Was what I wanted. I have the pressure system and have been using it for five years and would not be without it. I have six lamps.
Yours truly Sam'l A. Crowell.

Away with the Dangerous Kerosene Lamp

Think what it will mean to you to be able to say, *"I am never going to have a kerosene lamp in my house again."* You hate them—everybody does. There is not a single thing to say in their favor. They are dirty, messy, smelly—**dangerous!** You have put up with them the same as thousands of others have—just because there was no better substitute within your reach. The women folk have spent hours in cleaning, filling and trimming them—day in and day out—year in and year out. Possibly you have grown so familiar with the danger of fire and explosions that you scarcely think of it any more. ***But here is the way out—***

An Ann Arbor System Costs Little to Install—Almost Nothing to Operate

From the very day that you install an Ann Arbor System in your home, you can flood every room with a light that is **just like daylight** whenever you want to. There is no glare—no eye strain—no dirt—no work—no danger.

Such wonderful light! Think of it—**daylight at night!** In its clear, brilliant—yet restful—radiance, you can see to read the finest print with ease, no matter how far you may sit from the light. The women folk can do the finest sewing. They can match colors perfectly. There is not a single thing that you can do by daylight that you can't do at night if you have an Ann Arbor system in your home. And here is the best part of the whole story. **The first cost of an Ann Arbor System is less than you would have to pay for an ordinary cow.** Its upkeep is so low—so very low that the actual figures seem almost beyond belief. Our big book explains just how and why even kerosene lighting is 15 times as expensive as Night Daylight.

You don't even need anybody to help you install the system. You can do every bit of the work yourself in one day easily. There is no chance to go wrong or to make a mistake. There is nothing complicated—nothing to get out of order.

Free Coupon

Just Write Now—Get This Book FREE

Find out about this wonderful system right away—**without another day's delay.** Our big book, ***"Night Daylight,"*** tells the whole story. It explains just how you can get the system especially designed for your own particular use without a cent of extra cost. It tells just how your home should be lighted—it solves your lighting problems absolutely. Every single feature of the Ann Arbor System is explained plainly and clearly. You must get this book. Its value to you is greater than you can even imagine until you get it. It points the way to greater comfort—greater pleasure in your home—better health and perfect satisfaction for you and every member of your family. It is full of real, valuable, practical information.

Just send the coupon or a postal or letter. That is all you have to do. Find out anyway. There are no obligations—but **we want you to have this book.** Don't wait a minute—don't even lay down this paper or turn this page until you have sent for it.

SEVENTY-SIXTH ANNUAL EDITION

DREER'S GARDEN BOOK — 1914 —

EACH YEAR DREER'S GARDEN BOOK becomes more valuable and indispensable to gardeners and flower-lovers, whether they are amateurs or professionals.

DREER'S GARDEN BOOK for 1914 contains cultural articles written by experts, as well as authoritative information about the growing of every flower, plant or vegetable. And every dependable old standby, as well as all the novelties worth growing, are listed. Among this year's specialties will be particularly fine strains of Asters, Snapdragons, Dahlias, etc.

It tells what to plant, and when and how to plant and care for your garden. It describes the tools, insecticides and fungicides to use.

DREER'S GARDEN BOOK contains hundreds of photographic illustrations besides duotone and colored plates.

Mailed free to you if you mention this publication.

HENRY A. DREER, 714 Chestnut St. Philadelphia

EVENTS OF THE WEEK.

DOMESTIC.—Proceedings against all real estate companies transacting a banking business alleged to be in violation of the law will be instituted soon, said Attorney General Carmody of New York Jan. 8. The Monaton Realty Investing Company, of New York, will be made a defendant, the Attorney General said. The Appellate Court recently held that it was doing an unauthorized business. It had sold about $1,000,000 worth of certificates. Forfeiture of its charter and the appointment of a receiver will be asked. The company has offices in several cities. Two clergymen were among its salesmen.

Christian P. Christensen, formerly a Baptist minister, was arraigned in Hoboken, N. J., Jan. 8, on the charge of practising witchcraft and was held in $500 bail.

In the year just ended, according to statistics completed by William C. Moore, landing agent at Ellis Island, New York, 1,332,200 passengers arrived at this port, 952,834 coming in the steerage. The steamships of twenty-six lines brought here 148,956 first cabin passengers and 230,410 second cabin passengers.

Charles I. Greenfield, Meyer Rotman and Samuel Brown, under arrest at Philadelphia, Pa., charged with defrauding wholesale concerns throughout the country of $500,000 by a system of fake references, were held in $32,000 bail, Jan. 8, on charges of attempting to swindle by use of the United States mails.

Road repair work which a State inspector estimated would cost at the outside $3 a cubic yard was contracted for without bids by the New York State Highways Department at $4.50 a cubic yard, an unnecessary cost to the State of about $1,200 a mile. Another outside estimate of $3.75 a cubic yard was raised to $6.25 a cubic yard when let to contractors by State officials at Albany. This "graft" was at the rate of about $2,000 a mile. This testimony was given Jan. 9, by William G. Merritt, who was an inspector of highways in Ulster county from 1907 to 1912.

The capsizing of a motor cutter from the battleship Wyoming, flagship of the Atlantic fleet, in Hampton Roads, Jan. 9, resulted in the loss of the lives of four seamen of the Wyoming's crew. Twelve others were picked up by a tug sent to their rescue. The accident occurred near the spot where a launch from the battleship Minnesota went down in 1907 with 11 men, six of them young midshipmen returning from a ball at the Jamestown exposition grounds.

Twelve men, five whites and seven negroes, were killed in an explosion in the Rock Castle mine of the Davis Creek Coal Company, thirty-five miles south of Birmingham, Ala., Jan. 10. More than two hundred men were at work in the mine when the explosion occurred. All except 12 got out of the workings before the after damp affected them seriously. The explosion is believed to have been of gas origin, igniting dust in the mine.

An agreement between the Department of Justice and the New York, New Haven and Hartford Railroad that provides for a reorganization of the road in conformity with the Administration's interpretation of the Sherman anti-trust law was reached in a conference held at Washington, Jan. 10. As a result the Department of Justice will abandon the suit for a dissolution of the New Haven system that was prepared for filing in the courts in the event that those authorized to speak for the road found themselves unable or unwilling to comply with the demands of the Government. For the second time, therefore, the Administration has succeeded in settling a big anti-trust case without resort to the courts. The Administration's "peaceful" policy of adjusting disputes with corporations charged with violating or evading the anti-trust laws first found expression in the agreement perfected by Attorney-General McReynolds with the American Telephone and Telegraph Company whereby that concern pledged itself to dispose of its stock in the Western Union Telegraph Company. The New Haven road gives up the following: Boston and Maine control, all its trolley systems, Merchants and Miners Line, Eastern Steamship Corporation, Maine Steamship Company. It retains other steamship lines, including the Long Island Sound service, until Interstate Commerce Commission gives ruling.

Driven by a gale which piled up battering seas the Royal Mail Packet steamship Cobequid struck on the rocks that fringe the mouth of the Bay of Fundy, Jan. 13. Thirty-six hours later 94 of the 106 persons aboard the vessel were taken off by coast steamers and brought into Yarmouth. Capt. Howson and 11 men remained on board. No lives were lost, but all the crew suffered greatly in the intense cold, for the temperature was below zero and the steamer's decks were awash, and the seas, which froze where they fell, converted the wreck into a gigantic icicle. Passengers and crew were kept below decks during their terribly long vigil, which largely accounts for all lives being saved. Bridge, deckhouse and practically everything moveable were swept from the ship's decks by the seas, which continually broke over her. The wireless operator was able to get out one call for help before his aerials iced up, after which he was helpless. Her furnace fires were put out in a few minutes and the passengers and crew were forced by the rapidly rising waters to the boat deck, where they took refuge in the captain's quarters. For 24 hours in the midst of one of the worst storms, with Winter seas sweeping their vessel and breaking it up beneath them, these people had to huddle together. One of the men succeeded in getting a metal bucket, in which some holes were punched to make a draught. In this a small fire was started where some warm drinks were prepared for the women and children.

Fire which seriously threatened the business center of Montreal, P. Q., was subdued Jan. 13. The loss is estimated at $500,000. For a time the historic Notre Dame Cathedral was threatened. Flames broke out in a building adjacent to the cathedral, but were checked. Battling in a temperature 25 degrees below zero, firemen were not only hampered by the bitter cold, but by the fact that half a dozen other fires broke out almost simultaneously. At one time only seven pieces of apparatus were left with which to combat the central fire. Almost every fireman sustained frostbites, and so serious were the injuries and the effects of the frost that offices nearby were turned into a temporary hospital.

FARM AND GARDEN.—C. L. Marlatt, chairman of the Federal Horticultural Board, has asked for an appropriation of $35,000 to keep the Mediterranean fruit fly from coming to the United States from Hawaii and elsewhere.

The Garden City Producers' Association has been formed by truck farmers and market gardeners in the vicinity of Tampa, Fla., with the following officers: Horton C. Powell, president; —— Jordan, vice-president; J. L. Simmons, secretary; H. S. Wisner, manager.

The following officers were elected at the annual meeting of the Washington State Horticultural Association at Walla Walla: Michael Horan, Wenatchee, president; R. Edward Trumble, Wenatchee, secretary; H. C. Sampson, Spokane, first vice-president; J. H. Wright, Yakima, second vice-president; P. H. Weyrauch, Walla Walla, treasurer. The next meeting will be held at Wenatchee.

Two measures, one designed to improve the lot of the farmer and the other the lot of the housewife, will be pressed for consideration in the Senate soon after Congress reconvenes. Senator Smith, of Georgia, will ask the Senate to take up his bill providing for co-operative agricultural extension work, and Senator Smoot will ask to have considered his bill to provide for researches and experiments in the field of home economics. In the last Congress the House passed a bill to establish agricultural extension departments in connection with agricultural colleges. The Senate also passed the measure, but added to it a scheme for aiding vocational education. The House refused to accept the amendment, and the bill failed.

Leaders of the Poultry Workers' Union announced, Jan. 13, that more than 2,600,000 pounds (1,300 tons) of kosher poultry are tied up already as a result of the strike of the butchers, and that by the end of the week the amount of kosher poultry tied up will be almost 10,000,000 pounds. The announcement was also made that 1,000 kosher meat butchers would go out on strike. The butchers demand that their "bosses" employ only rabbis who are members of the union to kill poultry. Demands for a minimum wage of $14 a week, shorter hours and recognition of the union are also made.

The Sir William Vestey Company, of England, is the lessee of the sixteen acres of waterfront buildings in the New York Dock Company property in Brooklyn. Sir William Vestey is at the head of the corporation, which is largely interested in the meat industry in England. It plans to market here beef from Argentina, Australia and New Zealand.

VOLCANIC ACTION IN JAPAN.—The city of Kagoshima, with 64,000 inhabitants, was totally destroyed by a flood of fire from the Sakurashima volcano, which burst into activity on Jan. 11. The three villages on the island of Sakura were blotted out by the molten lava which poured from the crater, and 15,000 persons are believed to have perished there. Nearly 100,000 persons are feared to be dead in the greatest volcanic disaster since the destruction of St. Pierre by the eruption of Mont Pelee. The whole volcanic range of Kiushiu burst into dangerous activity with startling suddenness after having been quiescent for more than a century. Kagoshima was obliterated exactly as ancient Pompeii was engulfed by the flaming ashes pouring from Vesuvius. Hundreds of earthquake shocks were felt all through the islands. Railroads, telegraph lines and telephone lines were destroyed. Ashes from the volcano fell into the city of Nagasaki, 100 miles away. The earthquake shocks were felt principally throughout the Kiushiu area.

AMONG the members of a work gang on a certain railway was an Irishman, who claimed to be very good at figuring. The boss, thinking that he would get ahead of Pat, said: "Say, Pat, how many shirts can you get out of a yard?" "That depends," answered Pat, "on whose yard you get into."—Winnipeg Telegram.

COMING FARMERS' MEETINGS.

Ohio State Horticultural Society, annual meeting, Cleveland, O., January 20-23, in connection with the Fifth Annual Ohio State Apple Show.

Virginia State Horticultural Society, annual meeting, Richmond, Va., January 21-23.

New York State School of Agriculture, Alfred, N. Y., short course in agriculture beginning January 26; Farmers' Week, February 23-26.

Tennessee State Horticultural Society, State Nurserymen's Association, State Beekeepers' Association, Nashville, Tenn., January 28-30.

Forty-first annual meeting, New Jersey State Board of Agriculture, Trenton, N. J., January 29-30.

Farmers' Week, State School of Agriculture, Canton, N. Y., January 26-31.

Ohio Corn Improvement Association, Mansfield, O., January 27-30.

Western New York Horticultural Society, Rochester, N. Y., January 28-29-30.

Farmers' Week, Ohio State University, Columbus, Ohio, February 2-6.

Sixth National Corn Exhibition, State Fair Ground, Dallas, Texas, February 10-24.

Granite State Dairymen's Association, Concord, N. H., February 12.

Massachusetts Agricultural College, Amherst, ten-weeks' Winter course, January 6 to March 13.

Thirty-ninth annual meeting of the American Association of Nurserymen, Cleveland, O., June 24-26.

CROPS AND PRICES.

I find the greatest need here, as in other localities, is how to get a bigger per cent. of the consumer's dollar rather than bigger crops for less money for the farmers and a bigger profit for the middleman. It looks a little as though, if we could raise twice as much as we do now, we would get more work and less money, and the consumer would not benefit in the least. Prices here to the farmer are: Wheat, 96; oats, 43; corn, shelled, 76; hay, Timothy, $16 to $17; clover, $13 to $15; eggs, 40 to 45; butter, country, 30; creamery, 34. C. R.
Lake, O.

Cattle on the hoof, three to six cents per pound, according to condition, etc. of animals; dressed, nine cents per pound fore quarter, 11 cents hind quarter. No sales in this township at present for calves. Hogs, 13 to 14 cents per pound dressed. Fresh milk, five cents per quart, private sales; cheese, 22; butter, 32; eggs, 32. Apples being the main fruit sold and it being a bad year around here for them, it seems to me that those who have them get whatever they can. I sold some recently at 60 cents per bushel, choice Baldwins, a very low price for the quality. C. E. H.
Dingman's Ferry, N. Y.

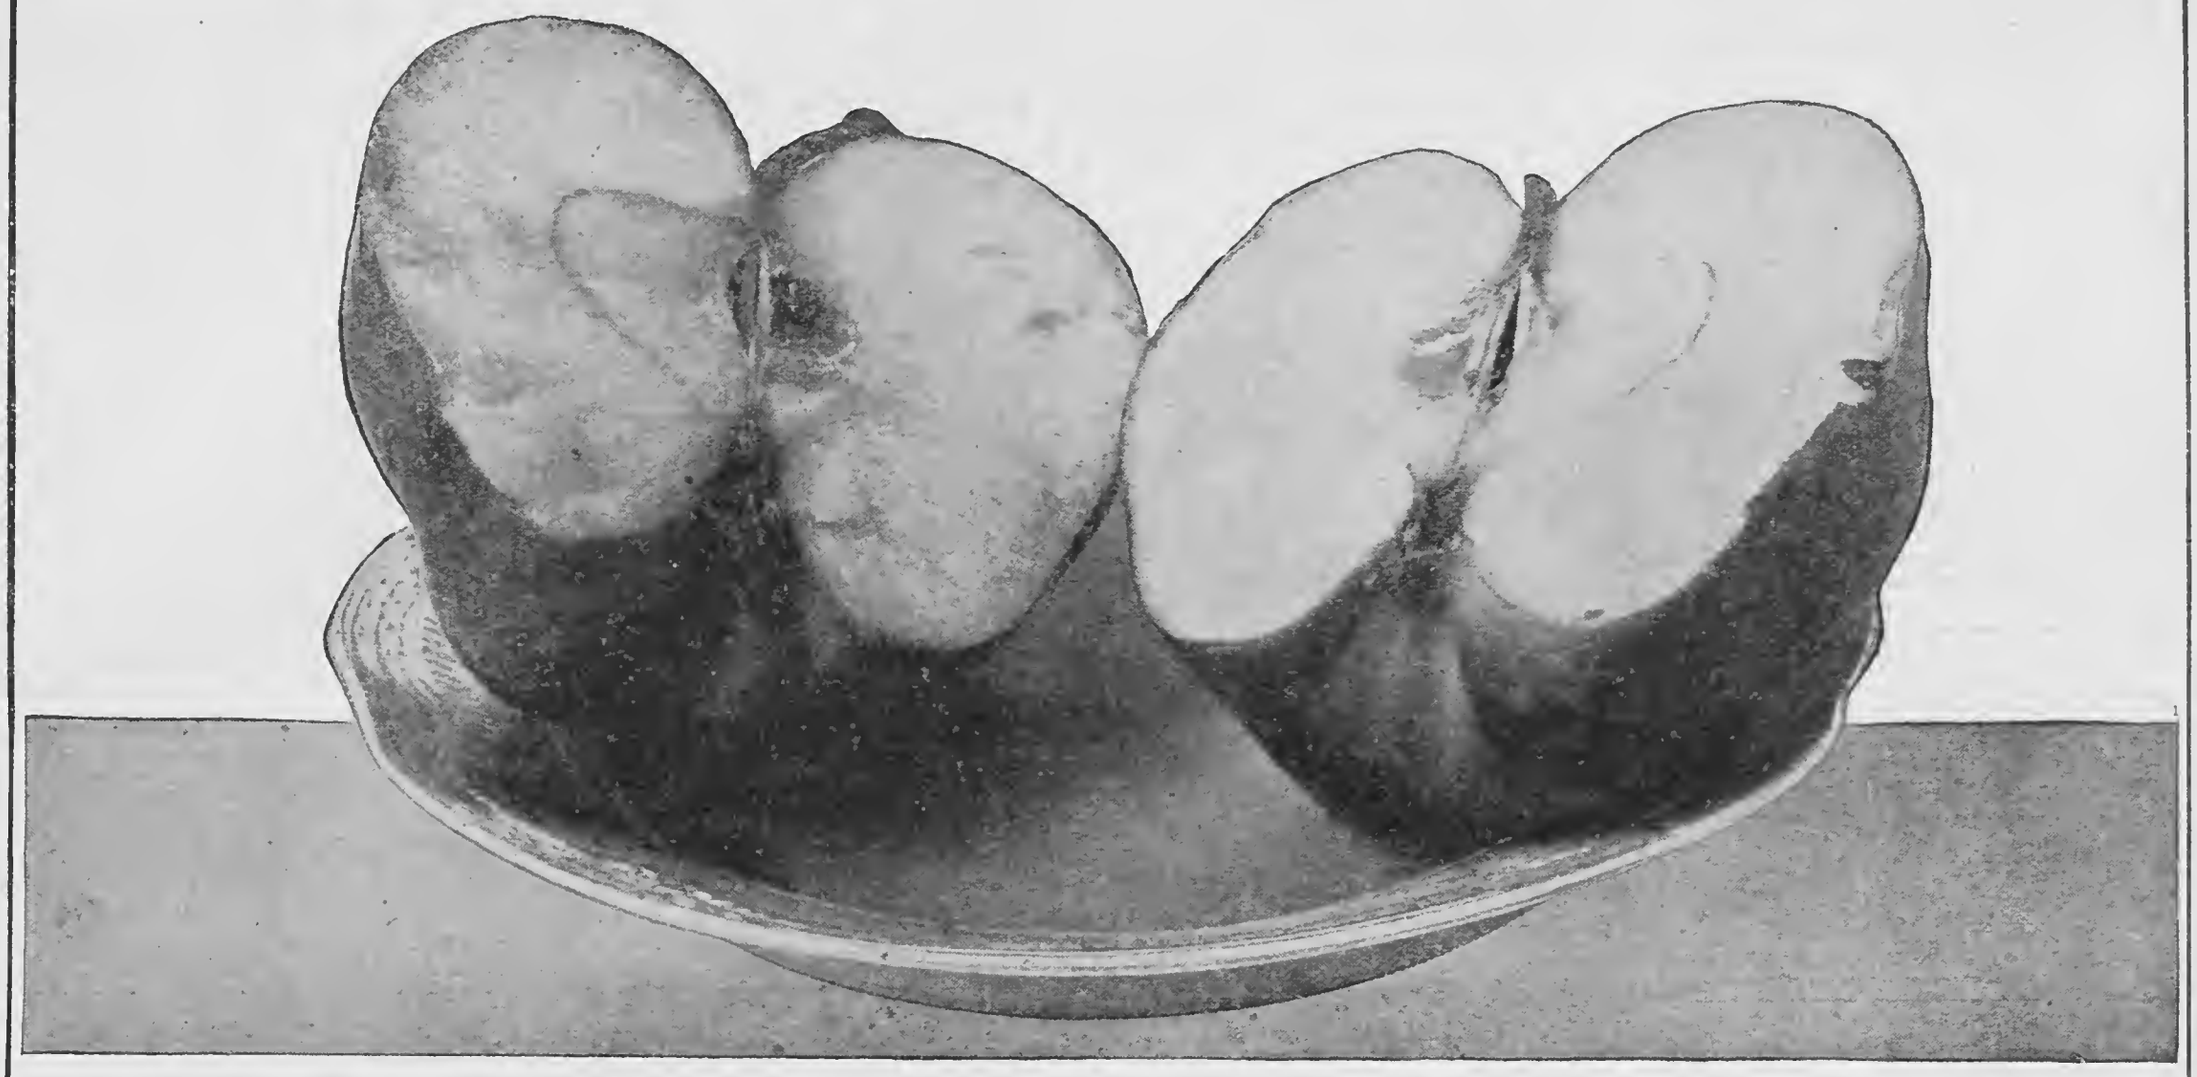
Wheat is selling at about $1 per bushel and corn at the same; hay $20 per ton. Potatoes are retailing at from 90 to $1.20 per bushel. Apples from $2 to $2.50 per bushel. There are not enough cattle sold here to establish a price. Hogs are selling at about eight cents per pound, pork from 11 to 14 cents per pound; butter, 40 to 45; eggs about all that one would ask for them. W. F. B.
Dawson, Pa.

Butter, 33 to 35; eggs, 35 to 38; fat cattle, 6½ to eight, dealer's price. Hogs, 10 to 11. Apples, Stayman and Limbertwig, $1.25; other varieties cheaper. Cabbage, 1½ cents per pound. G. M.
Dillsburg, Pa.

Hay, baled, Timothy, $16; clover, $13; corn, 60; potatoes, 70. Beef cattle, $7 to $8 per 100 pounds; creamery milk, delivered, $1.80 per 100 pounds; retail butter, 44. E. P. W.
Doe Run, Pa.

Dairymen are filling their icehouses with a fine quality of ice from private ponds and lakes. Ice is from nine to 14 inches thick; have had quite good sleighing since Christmas, which helps a whole lot with hauling loads. Some are getting out the next year's supply of wood and some lumber for repair work. Several new silos were built last Fall, but none entirely filled with corn, as the corn was a very poor crop. The Granges are alive and doing good work for their respective communities. They have recently elected new officers and are busy installing the same now; Past Masters usually serve as installing officers, after which refreshments are served by the sisters, while all have an enjoyable time. V. S. C.
Elk Creek, N. Y.

Veals, live, 10½; beef cattle, six to seven live weight. Eggs, 32; butter, 32 to 35; potatoes, 75 cents per 60 pounds; oats, 50; corn, $1.60 per 100 pounds; buckwheat, $1.60 per 100. Milk sold at cheese factory for December, 50; January, 47; for butter fat, which makes milk range from about $1.80 to $2 per 100 pounds. The milk sold at cheese factory is made into Swiss cheese by a native of Switzerland, except in time of shortage of milk at an adjacent shipping station, when it is contributed to New York shipments. Hay sells for $13 to $15 per ton at barn, price depending on quality. Prices here of general produce helped much by home markets of three mining towns located, one five miles distant and two about 10 miles distant.
Covington, Pa. S. P.



Send orders for Genuine Delicious

now, direct to

William P. Stark Nurseries
Stark City, Missouri

William P. Stark
Nearly 20 years ago Mr. Stark recognized the fruit and tree qualities destined to make Delicious the leader among apples and to his efforts is largely due its present nation-wide popularity.

Our exclusive contract with owner of original tree your protection

A twenty-year contract with S. L. Hiatt, son of Jesse Hiatt, gives us the *sole right and control* of *all* buds, scions and grafts cut from the *original* Delicious apple tree. This is your best guarantee of the *genuine* Delicious trees of unquestionable purity. *Read the contract!*

Selected trees at 30% to 50% saving

Since Jesse Hiatt first gave the Delicious apple to the world, William P. Stark has been intimately identified with its development, success and nation-wide distribution.

We *now* offer readers of the Rural New Yorker genuine guaranteed Delicious apple trees, propagated and grown under Mr. William P. Stark's personal supervision, at lowest grower's prices—at 30% to 50% less than you usually pay. We have no agents, no salesmen, no plate-book men. By cutting out all middlemen, and selling direct to the planter, we can quote you low grower's prices and deliver better trees. Why not take the saving?

William P. Stark trees are grown at Stark City, Missouri, in the heart of the finest nursery soil in the Ozark Mountains. They are propagated by experts; each tree is individually trained; they have tops which balance with the roots; and the root-system is the wonder of all who know good tree roots. *Every tree has the genuine William P. Stark quality.*

You who have wanted genuine Delicious trees can now get them direct from the grower and at grower's lowest prices. Write for new 120-page catalog.

Extract from

William P. Stark's Contract with S. L. Hiatt

"S. L. Hiatt hereby agrees to furnish William P. Stark exclusively all buds, scions, grafts and wood that may in any way be cut from the original Delicious tree, as William P. Stark may direct, and gives William P. Stark the exclusive right to control all of the scions, buds, grafts and wood for a term of twenty (20) years."

The J. H. Hale peach—another triumph

This is the "Peach King's" masterpiece—a peach ⅓ to ½ larger than Elberta; higher colored; a better keeper and shipper; with *practically fuzzless skin*; ripens five days ahead of Elberta; hangs longer on the tree; perfect free-stone; brings 25% to 50% higher prices than best Elberta. An ideal peach for largest commercial plantings or the smallest home garden.

Our trees are propagated from buds cut from the most vigorous bearing trees in Mr. Hale's orchards. There has been such a tremendous demand for The J. H. Hale peach that it will be simply impossibe to supply all those who want trees this season. *Write us at once to be sure of your spring planting.* In a few weeks our stock will be entirely exhausted.

Choicest varieties at grower's prices

William P. Stark quality is a yard-stick among fruit growers who *know*. It covers strain, size, vigor, productiveness, root-system and all-'round merit. In apples we list most profitable varieties; as McIntosh, Wealthy, Baldwin, Rhode Island Greening, Yellow Transparent, Black Ben, Jonathan, Stayman Winesap, Duchess, Liveland Raspberry, Gravenstein, etc.

Peaches: Elberta, Early Elberta, etc., at low grower's prices. Every profitable variety of apple, peach, pear, plum, cherry, quince, apricot, grape, currant, blackberry, raspberry, gooseberry, roses, shrubs and ornamentals. All trees and plants *doubly guaranteed* to be true to name.

Send for 120-page book now!

All prices printed in plain figures. Careful arrangement and common-sense descriptions make intelligent selection easy. Compare the prices and note the big saving. This catalog is our *only* salesman. Write for it today and get William P. Stark quality and William P. Stark's money-saving prices.

How we grow 2-year-old Delicious trees

We individually train our two-year-old trees as if intended for our own orchards. Note how branches are distributed over upper 14 to 16 inches of the trunk. This makes it possible for you to have either medium or low headed trees without weak crotches. Most old-style two-year-old trees are headed high with a few branches, all starting near the top; such trees will split under heavy crops. William P. Stark trees are grown so they may be shaped into perfect, open, spreading, vase-shaped heads, to carry heavy loads of fruit without breaking.

Who Is Green?

C. A. Green

We'll tell you: For 15 years Charles A. Green was a banker at Rochester, N. Y. In 1874 he retired to a run-down farm near Rochester and began fruit growing. His success, not alone in growing fruit, but in *teaching fruit growing*, has been remarkable. He has added millions to the wealth of this country. At present he is growing over 100 varieties of apples alone, besides many varieties of other fruits—large and small—without which the public exhibitions at our state fairs would not be complete.

34 years ago he established the nationally known monthly magazine—*Green's Fruit Grower*—which now has about 125,000 subscribers. This valuable publication is of vital importance to every fruit grower—tells just where, when and how to grow fruit. Subscription price is 50c a year—three years for $1.00. Green's book, "How I Made the Old Farm Pay," *free* with subscription. Sample copy of *Green's Fruit Grower free to you.* Write today.

Green's Fruit Grower Publishing Co.
Box 303, Rochester, N. Y.

GREAT DANE OATS

Often yield 80 to 100 bushels per acre. Heads are large, kernels have thin shuck and heavy meat. Of beautiful golden yellow color and fine quality. Stools heavily and has strong, stiff straw, on account of which it seldom lodges.

Blue Mountain Ensilage Corn

Produces mammoth yields of high quality forage. Earlier than ordinary ensilage. We offer extra selected seed.

Descriptive Circular FREE

Fully illustrates and describes all our pedigreed Seeds—Oats, Ensilage Corn, Potatoes, Etc. Be sure to write for this circular today.

THE JOY Blackberry

brings joy to all who grow, sell or eat it. It is more luscious in flavor than any other Blackberry I have ever grown, and is very large, being almost as thick through as it is long. The canes are of iron-clad hardihood, so strong as to need no staking, and bear heavily *every* year. In the winter of 1911-12 every Blackberry in my trial grounds was damaged more or less *except the JOY*, which came through with every bud and terminal in perfect condition. In my long experience with this berry its canes have never been affected, even slightly, by orange rust or other disease.

Headquarters for St. Regis Everbearing, the best red Raspberry, and Caco, by far the choicest of all hardy Grapes. A full assortment of Strawberries, Raspberries, Blackberries, Grapes, Currants, Gooseberries, Garden Roots, Hardy Perennial Plants, Shrubs and Vines, Evergreen and Shade Trees, Roses, Hedge Plants, etc. Illustrated descriptive catalog, replete with cultural instructions, free to everybody. Established 1878. 200 acres. Quality unsurpassed. Prices low.

THE RURAL NEW-YORKER,
333 WEST 30th ST., NEW YORK.

NORWAY SPRUCE.

I send some leaves or spikes of a tree which some call Norway spruce and some Norway pine. Can you tell me the true name. They had some seed spikes like our pine which I would like to plant and would like information how to plant and whether they grow in our locality?

Tylersville, Pa. J. S. R.

The twig sent is the Norway spruce, Picea excelsa. This is one of the most beautifnl standard evergreens, hardy, a rapid grower, adaptable to many soils and climates, and of elegant pointed form, often with drooping branchlets. It is propagated by seeds without difficnlty, seeds ripening in Fall. Conifer seeds call for a mellow seed-bed, the seed being nsnally sown in May, but where a small quantity is to be sown, it is a good plan to sow in boxes. The plan used in such cases at the Arnold Arboretum is to sow the seed (which is not covered more than one-fourth inch) in well-drained boxes as soon as ripe, pile boxes four or five deep in a sheltered place, cover with boards, and when weather becomes severe add a covering of hay. About the middle of April move boxes to where they get the morning sun, keep them weeded and watered, and shade through the Summer with lath screens. Winter the seedlings in the boxes, covered as before, and transplant into rows in good well-tilled soil the next Spring, when they are making the first or second set of rough leaves.

Hemp Cultivation in California.

I am engaged in raising hemp in California; am sowing, or going to sow, 200 acres in 1914. I have been engaged in that pursuit since 1874, and up to 1896 all in Illinois. In 1896 I came to California, and continued to raise hemp up to the present time. Just now I have found an ideal place here, for the business. Even although the rainfall is meager, we are in a situation where we can syphon water from the San Joaquin River, into our hemp field, over 20-feet levee, and irrigate the crop, all Snmmer, our "rainless Summers." With irrigation and a little nitrate of soda, 100 pounds every year, we can raise close to 2000 pounds on an acre of fibre on good land. We let the rains, and river or tule fog rot the hemp in the Winter. So when we take the rotted hemp stalks off the land all or nearly all fertility in the hemp has been washed back into the soil where the hemp grew. Thus we require very little rotation in crops. Our soil is all peat, rotten tule roots and stalks, etc. The peat is very porous so that a small ditch nine inches wide and a foot deep every 80 feet supplies water to the hemp; a little water runs in all the ditches all the time until nearly cutting time, which is about October 1. A crop 10 feet high takes a lot of water in a Summer.

We have a good market in Oakland, Cal. The California cotton mills could consume 4,000 tons if they could get it, so they say. I run the hemp stalks when dry, after being rotted, through a mill of my own invention at the rate of getting 2,500 pounds fibre per day. Hemp fibre is now worth $150 per 2,000 pounds fibre delivered at mill, or $165 delivered in New York. J. H.

"Jersey Red" Soil.

What is the composition of the soil which is so commonly met with in New Jersey, and referred to as "Jersey red?" I have been told that this soil is not the most desirable for agricultural purposes, and that crops such as roots and tubers, cannot be successfully grown in this red ground. A. A.

Jamaica, N. Y.

Soil commonly known as "Jersey red" is a red shale or heavy red clay soil which is underlaid with red shale. It is found in New Jersey in a part of Middlesex and Somerset counties. It is especially adapted to the growing of hay, corn and forage crops. Apples seem to do fairly well on it, and in fact many crops are raised on it with success on the College Farm in New Brunswick. Alfalfa has been raised for a number of years on well-drained fields of this type of soil. If some green manure, such as clover, rye and vetch, etc., are plowed under and the soil is given a liberal application of ground limestone, which will grow root crops, the texture of the soil can be improved to serve as a suitable environment for almost any crop.

A. L. C.

INSURE SUCCESS OF SPRING SEEDINGS

Grow quicker and bigger crops of Alfalfa, Clover, Soy Beans, Peas, and all legumes, by inoculating your seed with

Ferguson's Nitrogen Fixing Bacteria

A composite culture of bacteria, which takes nitrogen from the air, converts it into available plant food and furnishes it to the plant. Makes a food for plants on barren ground; improves crops on good soil.
Nitrogen is the most necessary element for plant food. It insures bigger better and more profitable crops. Better returns in dollars and cents and better nutrition for your stock.
Be prepared in time for spring plants, order now. Bacteria for one acre $2.00; five acres $9.00. Agents wanted in communities not already allotted. Send immediately for descriptive literature B. F.

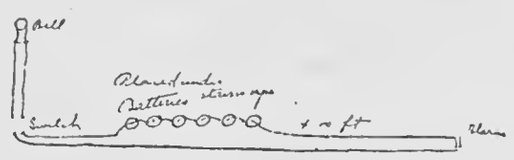
Farm Engineering.

CONNECTING ELECTRIC ALARM.

I have installed an electric alarm on an outbuilding about 400 feet from the house. I have this connected with an electric bell in the house, and have the wires connected with six dry batteries. For some reason or other I am unable to get any connection beyond 150 feet. Do you think I have enough batteries for so great a distance? I am enclosing a diagram showing how I have the batteries, etc., connected. D. R.

Rockland, Mass.

With the batteries in reasonably good condition you should be able to do this easily. Disconnect one of the battery wires, and with the switches closed scrape the loose end against the corrugated part of the binding post. If there is a spark, the bell vibrator is not adjusted properly and there is no other trouble, provided the wires are insulated from each other and are not short circuited. If there is no spark, probably there is a break in the wire, a poor connection at one of the binding posts or the bell vibrator is not adjusted properly. The latter case is doubtful as that should result in a spark.



Go over every binding post carefully, cleaning and brightening the wire and tightening the post. Then look over the wire carefully for breaks hidden by the insulation. This can readily be done by scraping a bare place on each wire every 50 feet or so, and connecting the two wires together with a third piece at each bare place, beginning at the house. If the bell rings at one point and not at the next, probably there is a break between the two places. If the bell doesn't ring with the cross connection at the point nearest the house and you are sure the batteries are all right, leave the cross connection made, disconnect one wire from the bell, loosen up the vibrator adjustment and gradually tighten it, making connection with the loose wire to the binding post every half turn or so.

R. P. C.

The Question of House Heating.

On page 10 R. P. C. gives some interesting figures in reply to G. C. about the cost of heating systems for a six-room house. It seems to me that these are too high. Ten years ago I built two houses, after one and the same plan, each containing six rooms and bath. In the one I put a hot-water system at a cost of $225. This gave us heat in two rooms and hall on first floor, also in one bedroom and bathroom on second floor; in fact by leaving doors open all bedrooms are comfortable even in very cold weather. It has never required more than five tons of coal to run this heater from November 1 till middle of April, and some seasons considerably less. The other house was equipped with a hot-air furnace at a cost of $90, and in the same length of time gets away with seven tons of coal, and if Winter is severe slightly more. I personally take care of both fires.

The hot-air system has required no repairs in the 10 years except cleaning and replacing of smoke pipe. Last Fall my own hot-water boiler sprung a leak. My local plumber, on making an examination, said it would have to be renewed. On being asked the cost he thought about $100. When I insisted on a written estimate he made it $86, explaining that a boiler of 500 rating would cost him $69; in fact he gave me to understand that he was figuring on a very small profit. He did not receive the contract, and put in a bill of $5 for looking at my boiler. At this time I bought, through a friend, who happens to be a builder living in another State, a heater of the same rating right from the factory for $46, freight prepaid. This was dealer's price, and this same heater is listed in regular catalogue at $141. On the advice of this friend I bought a pipe wrench, and with the help of one of my sons and a few other tools disconnected the old boiler, and by procuring some fittings and having some threads cut at a local shop at a cost of $7 was able in two days after receiving boiler to have the system in working order. The fact that the new heater was of a different make, and also because unions had to be inserted in floor and return pipes, made these extra fittings necessary.

If I had a six-room house-heating proposition to solve to-day, rather than pay a contractor $450 or more, as R. P. C. says, I would buy the whole outfit and put it in myself, and expect to come out from $100 to $200 ahead. Of course there are some points on which I should first make sure that I was well posted and thoroughly understood, such as the gradual ascending and descending of flow and return pipes without any dips or sags, the proper location of expansion tank, with escape pipe, etc. I know of course that the price of everything in general has advanced in the last 10 years, but hardly think this particular work has gone up 100% or more, but the trend of the times is to soak you "all the traffic will bear," and in this plumbers as a class certainly are no exception. J. B.

New Jersey.

Septic Tanks.

Can you give me a description of a good successful septic tank or house cesspool? I have descriptions of several, but they are not all alike. One has the inlet higher than the outlet, which seems sensible, another has both on same level, while in 1911 Report of the Department of Agriculture of Pennsylvania, the inlet pipe is below the outlet pipe, which is near the top of the tank, which, to me looks impractical, and would keep the inlet pipe always with sewage in it, therefore in danger of forcing the sewage gas backward. I would like to know the size for 10 people, how to construct, what kind of pipe to use for inlet and outlet, and the fall and length for each. Does it requires any ventilation? W. W. L.

Rutledgedale, Pa.

If you have the September 13, 1913, issue of this paper at hand, you will find in it a full discussion of the principles of septic tank construction, and an illustration of one suitable for household use. As you say, no two builders construct them exactly alike, but if the essential principles are followed, you should be able to install one that will do its work satisfactorily. The inlet pipe should be carried well below the surface of the tank contents. This will seal that pipe and minimize the disturbance caused by the inrush of sewage. House fixtures should also be trapped against sewage gas. The tank itself should not be ventilated. A tank four feet six inches deep, three feet wide and seven feet long, inside measurements, is sufficiently large for 10 people. The outlet should be so placed as to give a space of about 12 inches above the water level in the tank. Any watertight material may be used in the construction of the tank, but reinforced concrete is, perhaps, the most practicable. Vitrified pipe is most suitable for inlet and outlet pipes, the former of four, and the latter of three-inch size. The inlet pipe may be of any needed length and fall, the outlet pipe should connect with the tile drain through which the tank contents are discharged, and these drain tiles should have a uniform fall of 1-16-inch to the foot. M. B. D.

Homemade Brick for the Stove.

As Winter approaches there is much to get in shape, and the kitchen range and the sitting-room heater will have to do heavy duty during the cold months. The back of the range may have suffered from fire, and there may be holes in it which need patching. There may be cracks in the heater which could be at least temporarily closed and the stove would be safe and efficient for a time. In such cases a very simple fire brick might be made and applied as plaster. We have used it and found it did good service. We took the old formula of our grandparents, wood ashes and salt, mixed them equal parts, and to that added one part of Portland cement to two or three parts of the combined mixture. We wet it as in preparing a cement mortar, placed it in the back of the stove and immediately built the fire. The mixture proved very satisfactory, withstood intense heat from coal and was as firm withstanding fire, as though it had been stone. This mixture is easily prepared and applied, is inexpensive as well. This will not take the place of a new back or part for the stove direct from the factory, but it will do temporary service very satisfactorily. MRS. GERTRUDE JACK.

DOUBLE HEADED RYE.

Inclosed find a rye head which my day-help cut out of my wheat field. He said there were a great number like this one he saved. I would like to know what you think about it. Would seed from such a head produce a field of double heads? J. C. R.

J. C. R. has here an interesting and perhaps valuable variation in rye. This type of variation occurs occasionally in grasses, and the condition is more or less transmissible by the seed. Thus, it is not to be expected that the seed from such heads would produce a crop of all double heads; but it is to be expected that it would produce a large number, say 25% or more; of such stalks. It should be possible then, to separate out a pure strain of double-headed rye. At any rate, the probability seems well worth the trial. I would suggest that the seed be saved and planted well away from all other rye. Then since rye, like corn, cross-fertilizes freely, cut out all single-headed stalks *before the blossoms open*. A few years of this procedure may separate the pure strain, although it is more likely that more refined methods involving hand pollination will have to be adopted for the final isolation. However, if the double-headed character should show up each season for a few years in a considerable number of plants, it would show the presence of the pure strain in the mixture, and the more refined methods could then be employed. C. A. LUDWIG.

NEW YORK STATE NEWS.

STATE FAIR COMMISSION.—At a meeting of the State Fair Commission held in Albany recently acting Lieut.-Gov. Robert F. Wagner was elected president, Commissioner Huson vice-president and A. E. Brown secretary and treasurer. Assignments were made of the various commissioners to their departments at the next annual fair. Commissioner Huson has farm horses, dairy, Grange and farm boys' camp. Commissioner Jones, concessions and machinery; Commissioner Wieting, cattle, sheep and swine; Commissioner Cummings, police, liberal arts building, domestic science and transportation; Commissioner Driscoll, poultry, State institutions exhibits, woman's building and fire department.

DAIRYMEN'S LEAGUE.—At the annual meeting of the Dairymen's League, held in Albany the first week in January, the following officers were elected: President, John Y. Gerow, Washingtonville; vice-president, F. H. Thompson, Holland Patent; secretary, Albert Manning, Otisville; treasurer, Louis M. Hardin, Sussex, N. J. A strong effort is being made to get as large an enrollment as possible by February 1, when it is proposed to close the books. The number of cows pledged is still below the needed number to make the organization as strong as it should be to carry out the plans made for it by its officers and directorate. Several organizers are now in the field.

NEW FARM BUREAU.—About 400 representative farmers met at Oneonta the second week of this month to consider the organization of a Farm Bureau. M. C. Burritt, State leader of the Farm Bureau movement, addressed the meeting and explained the operation of the Bureau. An organization was effected and officers elected. A. W. Brown of Plainfield was chosen president, O. C. Chamberlin of Richfield vice-president and D. W. McLaury of Portlandville secretary. The location of the proposed Bureau caused considerable discussion, Cooperstown and Oneonta both desiring it. The matter was finally left with the executive committee for decision.

STATE FORESTRY ASSOCIATION.—The second annual meeting of the State Forestry Association will be held in the Educational building, Albany, on January 22. National and State experts will discuss some of the pressing questions with which the association has to deal. A State-wide forest fire law will be one of these.

CENTRAL RURAL SCHOOLS.—A bill has been introduced in the Legislature by Senator Brown which provides for the organization of central rural schools. The commissioner of education is authorized to lay out in any territory, exclusive of city school districts, central school districts and provide for the establishment of schools wherein instruction, as given in the common and high schools, shall be given including instruction in agriculture. Fifteen resident taxpayers may call a meeting to determine the question of establishing such a school and if there are 15 qualified voters present at such meeting a majority of that number will be sufficient to establish the school. The meeting shall also elect a board of education which shall possess the same powers as similar boards in union free school districts. These rural schools are to receive State aid on the basis of attendance and additional aid where the school gives instruction in agriculture, as in the case of other schools.

HOLSTEIN BREEDERS MEET.—It was decided at a recent meeting of the State Holstein-Friesian club to make an exhibit this year, the first time, at the National Dairy show at Chicago next Fall. A big showing will be made if present plans carry. E. A. Powell of Syracuse is at the head of the committee having charge of the matter. It was stated that the management of the show will allow the club to make a group exhibit and also allow animals in the group to be shown as individuals. The National Holstein-Friesian association will meet in Chicago and arrangements are to be made to carry a large delegation of New York breeders. This meeting will be in June.

NEW YORK STATE GRANGE.—The forty-first annual meeting of the New York State Grange will be held at Poughkeepsie on February 3 to 6. Headquarters will be at the Nelson House, sessions at the Columbus Institute. The voting membership of this annual meeting will be about 600 if associate delegates accompany the elected delegates, there being about 325 of the latter. Jefferson county has the largest delegation which will number 21 elected delegates. The Grange membership of that county is about 2,800. The session will open on Tuesday morning with the master's address. Reports of officers and presentation of resolutions for reference to all committees will occupy the second day. In the evening there will be a public meeting under the direction of the Dutchess county Pomona.

FRUIT GROWERS OPPOSE BILL.—Fruit growers in the western part of the State are intensely opposed to the McKellar bills now before Congress. This opposition was voiced at the recent convention of the State Fruit Growers' Association in Rochester and the Rochester Chamber of Commerce and other organizations have been asked to lend their aid to prevent the passage of the bills. The McKellar bills provide that interstate shipments "of meats, fish, butter or eggs or other perishable edibles or food stuffs must not be kept in cold storage for a longer period than 90 days." They also make unlawful the restorage of food products including fruits, and two of them contain requirements as to tagging and branding which fruit men feel are unnecessary and would entail much expense. What the fruit growers want is to have fruit exempted from the provisions of the bills, and it looks as if the 1,200 members of the association would let the interstate commerce committee and Congress know what they think about these measures promptly. President Morrell of the association expressed himself as in favor of better and more honest packing of fruit. He thought the Wilson bill was about as satisfactory as any he had seen. This divides apples into three grades, provides that the names and addresses of growers be placed on the boxes and imposes a fine for deceptions. He said he would favor a bill to put plates on barrels and boxes to show just what was inside them.

FARM BUREAU EXCHANGE.—The Farm Bureau of St. Lawrence county has established a produce exchange with a view to bringing producers and buyers closer together. It is simple in its workings and is just a medium of exchange between them. Any farmer may list with the Bureau what he has to sell and may write to ascertain where he may procure the things he needs. The Bureau is in position to advise farmers where farm machinery, fertilizers, lime, improved seeds, etc., can be produced most advantageously. This is a practical plan for each county and would seem to help shorten the distance between producer and consumer, and in this case the farmer is both. One day a farmer (not in St. Lawrence county) discovered that he had a few more bushels of seed rye than he needed and he took some of it to town to sell. He was informed by the dealer that seed rye "wasn't in much demand" just then but he would give 80 cents a bushel for it. He got it. The same day in the afternoon another farmer came to the store in search of a little seed rye. The same dealer said he had a few bushels that he could let him have for $1.50 a bushel; it was very nice. The farmer took it. A little later the transaction got out and it was discovered that these two farmers lived only about one mile apart on the same road. This is no fairy story, either. It is such conditions that the Farm Bureau is intended to eliminate.

Chicken and Lime Refuse.

I haul manure eight miles from St. Louis. At some meat shops it is mixed with chicken entrails and chicken manure. Is that better than horse manure? My neighbors say lime is good; I can get at a limestone quarry the residue from rock crushed for the roads for nothing. Will it pay to haul eight miles?
Wallston, Mo. J. B.

The chicken manure and entrails will add to the value of the horse manure. Lime is good for sour land, but do not mix it with this manure. The crushed limestone is not as valuable as the burned lime and would hardly pay to haul eight miles unless you know your soil is very sour.

How to Supply Your Soil

Just the Plant-Food Needed for Certain Crops

SOIL FERTILITY is a subject that must be handled to meet individual soil conditions and particular crop requirements if you would avoid wasting money when buying fertilizers.

After you have decided what mineral elements your soil needs, your next question is how to purchase these elements in the most efficient and economical form to apply.

We offer high-grade fertilizers to meet every soil condition and special crop requirement. Our products are scientifically correct fertilizers, made from the highest-grade chemicals and materials, and are practically odorless. No cheap, worthless "filler" is used which only adds weight and makes more labor to apply.

CONSUMERS BRAND FERTILIZERS

are prepared from your own specifications made out to meet the actual plant food requirements of your soil for any particular crop. You eliminate all waste of expensive elements when you order your commercial fertilizer direct from us.

The same soil of any field needs different fertilizers for different crops. The different soils of different fields need different fertilizers for the same crop. We make high-grade fertilizer to meet the exact needs of any field for any particular crop.

Don't waste money buying more nitrogen or more potash or more phosphoric acid—or any other element of plant food—than your soil needs for any particular crop. Commercial fertilizers are too expensive to apply from "stock" formulas.

Write today for free circulars. We sell only direct to the farmer.

Consumers Fertilizer Co.

Look to the Cement!

Blame it or give it credit for concrete results if the other materials are right. Cement is the chief material in making concrete. The other ingredients—sand, water and gravel when clean — are usually alike. But a difference in cement makes all the difference in the world in the finished structures.

Choose cement wisely and you'll choose

LEHIGH PORTLAND CEMENT

Because of its exceedingly high tensile strength, made possible by our distinctive and scientific process, Lehigh Cement imparts to concrete structures ever-increasing strength and lasting endurance.

It's a double safeguard. It protects your initial building cost and your whole building investment.

Send for our book, "The Modern Farmer." It tells all about Lehigh Cement and gives full instructions for making all farm buildings.

The Home Acre.

LAYING OUT A PLACE.

PART I.

Grass seed mixture can be procured from any seedsman, doing business in our seacoast cities. Along the margins of drive ways and walks a strip of sod eight or 10 inches wide should be laid to grade (with the exception of the walks in the vegetable and flower gardens, which should be sodded the entire width). This will hold the soil to grade and prevent washing out by heavy rains.

The driveway and walks should be excavated to a depth of six and four inches respectively and filled in with good gravel up to within one inch of the surface and rolled. Some people like an abundance of trees and shrubs on the lawn and its borders, while others prefer not so many. In the plan there is abundance specified. If too many to suit your taste, you can cut out as many of the plantings as will be necessary to conform with your ideas.

No estimate will be given on the cost of grading and laying out of the property, as that is a matter largely governed by local conditions and the cost of material. I cannot even guess what the cost of the work will be. The cost of planting the vegetable and annual flower garden is not included in this estimate, as that is also largely controlled by local conditions as to cost of labor, plants, etc.

PLANTING LIST WITH ESTIMATED COST.

1—12	Silver maples for driveway, 8 to 10 feet, at .75	$9.00
2—3	Silver maples for lawn	2.25
3—2	Oriental plane for lawn	2.50
4—1	Purple-leaved beech for lawn	4.00
5—1	European elm for lawn, 10 to 12 feet	1.00
6—1	European linden for lawn, 8 to 10 feet	1.00
7—1	Catalpa speciosa for lawn, 8 to 10 feet	1.00
8—13	Silver maple for street, 10 to 12 feet	13.00
9—1	Colorado blue spruce for lawn, 2 to 3 feet	1.50
10—1	Retinispora plumosa for lawn, 2 to 3 feet	1.50
11—1	R. plumosa aurea, 2 to 3 feet	1.50
12—1	R. squarrosa Veitchii, 2 to 3 feet	1.50
13—1	Douglas spruce, 2 to 3 feet	1.50
14—1	Norway spruce, 2 to 3 feet.	.75
15—2	Red Astrachau apple, 6 to 7 feet	1.20
16—3	Bartlett pear, 5 to 6 feet	3.00
17—2	Early Harvest apple, 6 to 7 feet	1.20
	SHRUB BORDER.	
18—6	Philadelphus grandiflorus, 2 to 3 feet	1.50
19—6	Syringa vulgaris, 2 to 3 feet	1.50
20—3	Althæa, assorted, 2 to 3 feet	.75
21—5	Lonicera Morrowi, 2 to 3 feet	1.25
22—11	Deutzia crenata fl. pl., 2 to 3 feet	2.75
23—8	Forsythia viridissima, 2 to 3 feet	1.50
24—4	Spiræa Billardi, 2 to 3 feet.	1.00
25—9	S. Van Houttei, 2 to 3 feet	2.25
26—9	Hydrangea paniculata grandiflora, 2 to 3 feet	2.25
27—8	Deutzia gracilis, 18 to 24 inches	2.80
28—9	Rosa rugosa rubra	2.70
29—8	Deutzia gracilis rosea	4.00
30—6	Spiræa Callosa alba	1.50
31—6	Spiræa Anthouy Waterer	1.50
32—9	Philadelphus nanus, 18 to 24 inches	2.25
33—7	Forsythia Suspensa, 2 to 3 feet	1.40
34—8	Deutzia Lemoinei, 2 to 3 feet	2.50
35—6	Weigela nana variegata, 2 to 3 feet	1.50
36—1	W. rosea, 2 to 3 feet	.25
37—1	Viburnum opulus-sterilis, 2 to 3 feet	.25
38—1	Deutzia candidissima, 2 to 3 feet	.25
39—1	Spiræa opulifolia, 2 to 3 feet	.25
40—1	Syringa vulgaris albus, 2 to 3 feet	.25
41—2	Spiræa Van Houttei, 2 to 3 feet	.50
42—1	Weigela amabilis, 2 to 3 feet	.20
43—1	Syringa Persica, 2 to 3 feet	.35
44—1	S. Persica alba, 2 to 3 feet	.35
45—1	Philadelphus aurea, 2 feet.	.35
46—3	Spiræa Van Houttei, 2 to 3 feet	.75
47—4	Spiræa Van Houttei, 2 to 3 feet	1.00
48—5	Deutzia candidissima, 2 to 3 feet	1.25
49—3	Syringa Villosa, 2 to 3 feet.	1.05
50—6	Hydrangea paniculata grandiflora, 2 to 3 feet	1.50
51—5	Spiræa Bumalda	1.25
52—5	Philadelphus Avalanche, 2 to 3 feet	2.50
53—16	Lonicera Halleana, Japan honeysuckle, to be trained on poultry wire attached to foundation and cornice of piazza, leaving openings resembling windows between the columns. If it is desired, every alternate plant may be Clematis paniculata	4.00
54—2	crescent shape flower beds in front of piazza for geraniums	
55—2	Spiræa Anthony Waterer	.50
56—3	Rhodotypos kerrioides, 2 to 3 feet	.75
57—2	Hypericum aureum	.70
58—2	Deutzia gracilis rosea	1.00
59—2	Thunberg's barberry, 2 feet	.60
60—3	Daphne Cneorum	1.50
61—2	Weigela nana foliis variegatis, 2 to 3 feet	.50
	FLOWER GARDEN, ETC.	
62—1	Climbing rose, Dr. Van Fleet, trained up to garage	.50
63—1	climbing rose Gardenia trained up to garage	.50
64—1	climbing Dorothy Perkins	.35
65—30	hardy bush roses two years old; 3 Gen. Jacqueminot, 3 Paul Neyron, 3 Coquette des Alpes, 3 Hugh Dickson, 3 Frau Karl Druschki, 3 Conrad F. Meyer, 3 Prince Camille de Rohan, 3 Clio, 3 Anna de Diesbach, 3 Ulrich Brunner	15.00
	HARDY HERBACEOUS PLANTS.	
66—7	Rudbeckia Golden Glow, at 15c.	1.05
67—7	Helenium autumnale, at 15c.	1.05
68—5	Eupatorium ageratoides, at 15c.	.75
69—6	Digitalis, assorted, at 15c.	.90
70—7	Heliopsis Pitcheriana, at 15c.	1.05
71—8	Hardy Phlox, mixed, at 15c.	1.25
72—8	Hardy Delphinium, mixed, at 15c.	1.20
73—5	German Iris, 5 Oriental poppy, at 15c.	1.50
74—4	Coreopsis lanceolata, 4 Asclepias tuberosa, at 15c.	1.20
75—7	Funkia cærulea, at 10c.	.70
76—7	assorted columbines, at 15c.	1.05
	VEGETABLE GARDEN.	
77—5	Currant bushes, 2-yr-old	1.00
78—4	Gooseberry, Downing	.60
79—8	Rhubarb	1.60
80—2	Sage, Holt's Mammoth	.30
81—2	Tarragon	.70
82—2	Spearmint	.20
84—100	strawberries, two rows, two feet apart, 18 inches apart in the row, rows full length of cultivated garden in fruit tree border; select such varieties that do well in the vicinity of Cape Cod	1.50
	Lawn grass seed, 3 bushels	15.00
		$152.60

A discount of 10 per cent. more may possibly be allowed, if all or nearly all the trees, shrubs, etc., is procured from one nursery.

85—85	assorted Althæa hedge on west and north sides of garden, planted 18 inches apart in the row	10.00
86—480	California privet hedge on west and north street lines, planted eight inches apart in the row, blocking ends of hedge at entrance to driveway by planting in squares of about 30 inches	10.00
	Total	$172.60

J. A. K.

English Walnuts for Ohio.

What about the English walnut? Is it hardy enough for latitude 41 deg. in Ohio? Would it be a profitable tree to plant? Can trees be raised from the nuts? Where could trees be procured? Is there any other thin-shelled nut that would do well in Ohio? T. F. Y.

As yet it is somewhat uncertain about the success of the Persian walnut in Ohio, but it would seem reasonable to think that the varieties that succeed in New York and Pennsylvania would be suitable there as well. But this tree is not so hardy as the native walnuts that grow all over Ohio, but needs a more equable climate. It seems to be the violent changes that injure the trees. Now that there are a very few nurseries propagating the hardy walnuts, pecans and some other nut trees by grafting them on native, hardy stocks, there ought to be a far more general trial of them and with much more success. Seedlings are uncertain as to variety, but they are far better than no trees at all. H. E. V. D.

SAFETY FIRST

Five Bars and a Crosstie—the Safety First Symbol

Five thick, tough Goodrich Rubber fingers—

They dig down through mud, slush and ooze; they clean and grip the road. They stop the skid before it starts. They give you lower-cost mileage because of the extra thickness of rubber at the point of contact.

Goodrich Safety Tread Tires

Best in the Long Run

Don't experiment. Don't take chances. Look for the five bars and the crosstie when you choose a non-skid tire.

Read the reduced prices below. Better still, tear out this price list and hand it to your dealer.

Don't pay more than the prices named here for the accepted *standard* non-skid and smooth tread tires:

Size	Smooth Tread Prices	Safety Tread Prices	Size	Smooth Tread Prices	Safety Tread Prices
30 x 3	$11.70	$12.65	34 x 4½	$33.00	$35.00
30 x 3½	15.75	17.00	35 x 4½	34.00	36.05
32 x 3½	16.75	18.10	36 x 4½	35.00	37.10
33 x 4	23.55	25.25	37 x 5	41.95	44.45
34 x 4	24.35	26.05	38 x 5½	54.00	57.30

Hope Farm Notes

THE SCRUB HENS.—My bug-eaters are attracting some attention even though they do not lay eggs at the laying contest. One expert far up in the poultry world is kind enough to say:

"Entering these scrubs was a fool thing to do. Doesn't everyone know such hens are failures?"

Then comes a practical man who makes his hens pay.

"This is the brainiest thing ever attempted in the hen business, for I can see just what you are trying to get at."

Now the Hope Farm man naturally disclaims the last statement, and matches his scrubs against the expert to disprove the first one.

Up to January 2, after the contest had gone on for 63 days, the Hope Farm scrubs had not laid an egg. I was in hopes one of them would remember me with a little New Year's offering, but they all declined. At home some of the birds from the same lot are laying, but those out in the limelight are either bashful, or else they want to give a good imitation of the turtle at the start and then come sailing along later. On January 5 I got word that one scrub had died of some unknown disease. I had another one warming up to go into the box, and now we have sent another.

Now let's have a good laugh at the Hope Farm scrubs, and then analyze the situation a little. Three hens in other pens have died—two Reds and a Leghorn—since the contest opened. One pen of Reds, one of Silver Campines, and one of the new Cornish breed have not laid an egg, and are tied for the leather medal with my scrubs. In all 10 pens have laid less than a dozen eggs. In the week ending January 2 the 820 hens in the contest laid 876 eggs. I found that 574 hens never laid an egg. Three birds laid seven eggs, or one every day; 13 laid six each; 44 laid five each, and 75 laid four each. Thus 135 hens out of 820 laid about 64 per cent. of the egg yield. Of Tom Barron's 10 Wyandottes, two laid seven eggs each, three laid six, three laid five, one laid four, and one acted like my 10 scrubs. At 50 cents a dozen you will realize that this means a weekly income of $2.16, or nearly 22 cents per hen.

Now there is a fine chance for some wild man to preach to an audience of back-to-the-landers. The average income of a hen is 22 cents a week. There are 52 weeks in a year; therefore a hen will earn an income of $11.44 a year. Throw off $1.44 for cost of feed and make it an even $10. Various gentlemen say they can take care of 1,000 or more hens. Therefore we have a clean profit of $10,000 per year—if you will only buy my stock or my appliances! If I were to take this back-to-the-lander and lead him up to my pen of scrubs with their zero record, he wouldn't thank me. Yet, down where they live rather than in the rosy dreams is where he would find himself until the hens taught him the game.

What is the real meaning of this difference between Tom Barron's Wyandottes and my scrubs? That is the "fool thing" I started out to learn. I think my scrubs will eat more than the Wyandottes and make far more noise when they do lay. They have the same care and the same opportunity. What is there in the Wyandottes which spells and shells *eggs?* Men come to me with an air of superiority and say they have hens at home that are beating anything at this contest. Some of the sisters of birds in that scrub pen are laying at Hope Farm. If any man claims he has the birds to beat these Wyandottes I am enough of a sport to challenge him to enter them next year. We will each put up the entrance fee. If his birds win he gets the entrance fee back; if they lose I get it back. No use for a man standing back and saying there is "nothing to it." If you have the hens to win in this contest, and they actually do it, your fortune is made—in the present belief that the ability to lay many eggs or to lay Winter eggs is carried on from the mother through her son. As for the blue ribbon gentlemen who are having such fun with my scrubs let them put up a pen of high scorers and I will match them with another pen of scrubs.

We have one class of poultry-keepers who say there is little or nothing in pedigree when it comes to laying qualities. These men say that if a hen actually has eggs within her she will have to lay if you give her all she needs of the proper food. What have these men to say about my scrubs? So far as one can tell from exterior markings these birds certainly are shaped for business. They are having the best food available and are handled in a scientific way. Yet they have not laid an egg. I knew that breeders of the heavier breeds claim that the egg ration in this contest is made up to suit the Leghorns rather than other breeds. Why, then, are Barron's Wyandottes beating the lighter and more active breeds? Evidently it will take something more than scientific feeding to induce my scrubs to lay in Winter. I imagine that their ancestors for many generations have acted like wild birds, laying a small clutch of eggs during warm weather. Must a hen have the breeding impulse within her to make her lay?

That is one of the "fool things" the Hope Farm man wants to know. Another year I want to take several of these scrubs as breeders. I am willing to take the finest male bird I can find, as judged by his mother's pedigree, and cross him on these scrubs. When we get eggs enough from this cross to give us some good pullets my plan is to take out this fine male and substitute as true a "dunghill" rooster as we can find. We will get some pullets from this cross and I will enter a pen of each at the laying contest. I will also, if possible, breed to a "blue ribboner"—one that scores highest at a poultry show, and enter another pen from him. That ought to show the value of "blood" in a farm flock—if there is any such value as is claimed for it.

In the Fall I broadcast 10 loads of fresh manure on two-thirds of an acre of land. This I plowed under and sowed to rye and vetch for white potatoes in the Spring. If I plow this and scatter the fertilizer in every third row and drop the seed and cover them with the next furrow, will the green rye injure them in any way? If I can do this safely it will save considerable work at a very busy time. T. W. K.

This can be done if you make very straight furrows and plow to an even depth. We shall try this next Spring. We have plowed in cabbage and potatoes this way with success. The green rye will offset the effect of the manure at starting scab. We find it best to follow with the Acme after plowing in the potatoes. This levels the field and packs down the soil.

I have a piece of ground that has not been worked for 30 years, and moss is starting to grow on it. What can I do to kill this, to sow clover in the field? It is good pasture but it is almost too swampy to plow. F. G.

Mount Holly, N. J.

It is very doubtful if you can get a stand of clover in such a field without drainage and thorough culture. You ought to plow such a field and give it a good coat of lime, and then grow a crop like corn, giving thorough culture to kill out the old sod. Then you can sow rye, and in the Spring seed with a mixture of Red and Alsike clover. If the land is too wet for plowing it is not likely that clover will endure there.

What would be the feeding value of red kidney beans? I have 70 bushels that are about two-thirds musty, but cows seem to eat them after being ground reasonably fine. What other feeds would you advise using to balance the ration? Also, what would you think of using them as a fertilizer, having them thoroughly ground and use in a grain drill the same as any commercial fertilizer? Could you tell me the fertilizing value of beans? I spread some on an old meadow last Spring, and found the grass was one-third better and of a much better color all through the season.

New York. M. C. K.

I think the beans would be better for sheep, but fed half bean meal and half cornmeal, they will make a fair cow ration. As a fertilizer the bean meal will rank as follows:

	Pounds in 100. Nitrogen.	Phos. Acid.	Potash.
Good beans ...	4.	1.20	1.30
Dried blood ...	12		
Cottonseed meal	7.	3.	1.75
Bean pomace..	5.	2.	1.25

Thus you will see that nitrogen is the valuable element in the beans. Mixed with potash and phos. acid the bean meal would make a good fertilizer. H. W. C.

Do you raise early or late potatoes?

There's a difference between early and late varieties that should be considered in fertilizing.

For the early kind use 1,000 pounds per acre of a fertilizer containing 10%

POTASH

5% ammonia and 8% phosphoric acid. Under average conditions, 800 pounds of 3-6-8 is the most profitable for late crops.

Some growers double these amounts, for they are convinced that Potash Pays.

Caution: Be sure your Potash for potatoes on heavy soil is in the form of Sulfate.

Write for Potash prices and for Free books with formulas and directions. We sell any amount of Potash from a 200-pound bag up.

and **"Electro" Arsenate** of **Lead Powder** (33%) which, used wet or dry, has no equal in strength or texture. Avoid imitations. **B. G. PRATT CO., Dept. N 50 Church Street, New York City.**

Ruralisms

COMMERCIAL QUINCE GROWING.

Will you inform me on the growing (commercially) of quinces? What sort of soil is needed? What methods of cultivation? Do they need spraying and what kinds would you set for Western Michigan? G. E. W.

Hart, Mich.

There is nothing more difficult about growing quinces than other fruits. The trees need good soil and to be sprayed for insects and fungus diseases the same as apple trees, and well cultivated. They should have very low heads. No special kind of soil is required, but it should be fertile and not water-soaked. About 20 feet apart is the distance to set them. There are not many varieties of the quince, but they differ somewhat in size, shape and season of ripening. The Orange, Meech, Van Deman and Champion are among the best kinds known. There are not enough grown to really supply the demand.

H. E. VAN DEMAN.

THE GLADIOLUS HAS ARRIVED.

As a Summer cut flower the Gladiolus stands preëminently the best. Every flower expands in water, and a bouquet is good for two whole weeks. It is not well adapted to bedding purposes, and I believe it is a mistake to plant it alone in rows or beds for the effect it will produce as such, but everyone should grow it in the garden for cut flowers for the house. This flower has been the particular prize of the hybridizer. It never comes true from seed, and so often produces superior sorts from carefully crossed seed, that nearly every commercial grower has his bed, or patch, or acre of seedlings, from which he hopes some day to give to the world the best one yet. Primarily the aim was for a larger flower. That this has been attained in a remarkable degree such kinds as Princeps and Mrs. Francis King well prove. Secondly the matter of color demanded attention, and in selfs practically all colors are represented, though the pure white has almost defied the effort of man. Rochester White now claims to be pure white even to the anthers. Augusta, Europa and Peace are nearly white and very beautiful, Peace being a massive flower on five-foot spikes and foliage to match. Pure yellows and reds are plentiful, but blues still hold out, though there are a number of good parti-colored blues.

The power of rapid reproduction has always been kept in view, and many otherwise good varieties have to go to the

GLADIOLUS MRS. KING.

discard because they do not divide and produce bulblet offshoots rapidly enough to become commercially valuable. Likewise some new kinds are very difficult to keep through the Winter and must be thrown aside for that reason. The arrangement of flowers on the spike is still another important feature, as a haphazard, some down and some up, etc., form makes an exceedingly poor-looking spike, no matter how good the flower is.

Best of all, these glorious flowers are about as easy to grow and have as weeds, and multiply so rapidly that with a small start a private or commercial collection is but a matter of a few years. The long catalogue lists may be puzzling to you, so I give here a shorter one, comprising the whole range of color and with no poor ones. For red get Mrs. Francis King, a true giant and of great beauty. America, the most grown of any known sort, is a shell pink, large, exceedingly beautiful and is one of the three varieties that florists want in quantity. Early cut flowers of this kind for your city market would be worth your while. Later in the season there is a glut of even the best kinds. Early April planted bulbs

GLADIOLUS AMERICA.

in rich, sandy soil and in full sun will hit the high price season for Americas. Augusta, a lavender-tinted white, is another of the three mentioned. It is a rather small flower, but splendidly arranged on the spike and many open at a time, one of the best for design work. Mrs. King, first referred to is the third. Panama, in form like America, is a deeper pink, and is just being introduced. It is one of the extra good ones, and you may not be able to find it listed. Golden King, about the best of the yellows, is a giant in every way. Klondyke is a smaller, less expensive yellow, but good enough for anyone. Canary Bird is one of the best pure yellows. Get Peace for a giant white, Taconic for a fine pink, Blue Jay or Baron Hulot best blues. Cracker Jack and Mrs. Beecher are large reds, curiously marked with white, which should be in your list. Evaline is a large smoky lilac or purple, a beauty. Brenchleyensis, bright scarlet, opens nearly its entire quota of buds at once, and is fine for a tall edging of hardy perennials to come in ahead of tall Salvias. The above are by no means all the good ones, but if you are a beginner and get some of all the above, your delight at blooming time will be great. If an enthusiast, add a few new ones each year, but grow each kind separately rather than mix them all up.

If you grow a mixture, bear in mind the fact that red varieties have a tendency to multiply more rapidly than other colors, and your collection will show a constantly increasing proportion of the reds. Also remember that old bulbs soon stop multiplying at all and run out, so if you do not wish to have to buy all over again in a few years, keep a new lot coming on each year from the little bulblets found around the base of the old bulb at digging time. Their culture is very simple. Soak twenty-four hours in warm water and plant thickly as you would peas, one to two inches deep. They will appear in a few weeks looking like stiff grass. Keep cultivated and thoroughly weeded and dig soon after hard frosts. The bulblets in turn will be found to have made a lot of new bulblets in addition to their now being bulbs of about one-half inch in diameter. The small bulbs will bloom the second year and make more bulblets, and so on in a never-ending cycle. You may soon get too many bulblets, but they are commercially valuable, and your seedsman or florist will undoubtedly take your surplus at a good figure if true to name and of good sorts.

Plant large bulbs four inches deep, from one inch to any desired distance apart. Give thorough cultivation and water if possible at blooming time. Never let fresh manure come in contact with growing bulbs. Dig bulbs in Fall and treat as potatoes, but they must be kept a little drier than potatoes. When cutting flowers for the house, do not cut much leaf, as it will ruin the bulb. Cut when the first two flowers are well expanded. In conclusion, just a word about growing from seed. It is very interesting. Save seed only from finest named sorts and if you understand cross-pollenizing, it is advisable to keep a record of the parentage of your seed, for if you should get a valuable one, it could be much easier disposed of advantageously if you knew the cross that produced it. Treat the seed much the same as bulblets, only it may be the third year before you get the flowers. P. L. W.

Michigan.

Genuine Thomas Phosphate Powder

(BASIC SLAG MEAL)

KEY-TREE BRAND

A TRIBUTE TO QUALITY—AND A WARNING

PROBABLY the most remarkable tribute ever paid to the uniformly superior quality of any one fertilizer material is the present offering of numerous so-called "Basic Slags" and "Phosphate Powders" that are said to be "just as good" as Genuine Thomas Phosphate Powder, Key-Tree Brand.

¶Every progressive farmer in the Eastern United States is familiar with the wonderful record that Genuine Thomas Phosphate Powder, Key-Tree Brand has made for itself in the production of fruits, cereals, clover and alfalfa.

¶You probably are not surprised therefore, that imitations and "nearly-as-goods" are being offered you. We have occasional calls for low grade Thomas Phosphate Powder ourselves. We always refuse the orders. We sell only one grade—the highest.

¶The following warning is from Page 38 of the Report of the Connecticut Agricultural Experiment Station for 1911:—

"BASIC SLAG PHOSPHATE OR THOMAS SLAG."

¶"The highest grade on the market contains from 17 to 19 per cent of phosphoric acid and 35 to 50 per cent of lime in finely divided form. **There are, however, very inferior grades offered for sale at prices which the farmer cannot afford to pay, and against which he should be on his guard."**

¶We guarantee Genuine Thomas Phosphate Powder, Key-Tree Brand to contain:—17 to 19 per cent Total Phosphoric Acid; 15 to 16 per cent Available Phosphoric Acid—(Wagner).

¶Genuine Thomas Phosphate Powder, Key-Tree Brand not only meets our guarantee, but exceeds it. Note the following:

¶Bulletin 143, Massachusetts Experiment Station, reports average test of eight samples: Total Phosphoric Acid, 18.41%; Available Phosphoric Acid, 15.61%.

¶The Maryland State Chemist reports for 1913, Total Phosphoric Acid, 19.40%; Available Phosphoric Acid, 17.00%—(Wagner).

¶Connecticut State Report for 1913 shows, Total Phosphoric Acid, 19.14%; Available Phosphoric Acid, 17.05%.

¶**Take no chances—for your own protection avoid so-called "Basic Slags" of doubtful origin and of uncertain composition.**

¶Insist on having Genuine Thomas Phosphate Powder, Key-Tree Brand, bearing on every package our trade mark shown herewith.

Fertilizers with many imitations are the best to buy—Imitation is recommendation

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

THE New York Experiment Station reports finding as high as four to six per cent of sand in samples of "screenings" used with wheat bran or middlings. Sometimes these screenings are sweetened and sold as molasses feeds. These screenings often carry seeds of the worst weeds which afflict our farms, and it has been shown that a fair proportion of such seeds live through the manure pile. Now sand may be a good thing to use as "grit" in a hen's gizzard, but why feed it to the good old cow? Perhaps they want to give her grit enough to face the screenings, splinters and trash in her feed!

*

IN a season such as the coming one promises to be, there will be much study of orchard heating. The year past was one of sudden and violent changes, with untimely frosts. Artificial means of creating heat in orchard or garden will be needed in many situations. In parts of the West the oil-burning orchard heaters have given fair satisfaction. They do best in protected situations, or where the night is still, so that the heated air is not blown rapidly away. In situations where the wind has a clear sweep, the heaters are not generally successful. They seem to do best in "pockets" or protected valleys where there is poor air drainage. We expect to have the experience of men who have tried those heaters under all sorts of conditions.

*

B. F. MASON, of Mercerville, Ind., is placing peach trees in Southern Ohio that he calls "Shipper's Late Red." He claims to have originated this variety, says that it is immune from yellows, brown rot, etc. He puts these trees in the hands of planters, and in a certain number of years is to receive 50 cents per tree for them.

We do not know Mr. Mason or his peach. If he is making these claims he is simply giving out a quantity of second-hand guff of naturally poor quality. There are no peach varieties "immune from yellows and brown rot." The plan of selling at 50 cents for future payment is part of a scheme used by many fakers. We warn our readers not to do business with any man who makes such claims for his trees. You will surely be disappointed if you are unwise enough to believe them.

*

THE prospects seem to be favorable now for starting some good farm coöperative work in the State of New York this year. Following a conference with Gov. Glynn, Geo. C. Van Tuyl, Jr., Superintendent of Banks, has appointed a Special Committee on Agricultural Credits to work in connection with the Banking Commission, which is charged with the duty of revising the banking laws of the State. Members of this committee are: Robert B. Van Cortlandt; Charles H. Sabin, vice-president of the Guarantee Trust Co.; Henry Burden, banker, Cazenovia, and John J. Dillon, publisher of THE RURAL NEW-YORKER. This committee is expected to perfect a bill to create a system of land bank credits and have it ready for the consideration of the New York State Agricultural Society's convention, January 20. In addition to the work of this committee, a conference was held at the Executive Chamber in Albany last week at which Governor Glynn presided, for the purpose of considering the agricultural needs of the State, with particular reference to credits and marketing. The sentiments of the conference were in favor of a bill to create a land bank on coöperative lines; to make some amendments to the Commission Bill; and to secure an appropriation to put coöperative instructors in the State to encourage and organize coöperative associations where there is a demand for them. Aside from the credit organizations, the principal object of this work is to obtain for the producer a larger share of the 35-cent dollar. Governor Glynn was emphatic in the position that the producer was not getting a square deal in the marketing and distribution of farm products, and he expressed a very decided interest in any measure that would promise better returns to the producer for the products of the farm. With his encouragement and influence, the measures will undoubtedly go through and an effort will at last be made to slice off some of the expense and waste in the transportation and sale of farm products, and to secure for the farmer a better share of the consumer's dollar.

*

ON the next page will be found a statement about the new income tax as it affects farmers. The Government estimates that 425,000 individuals will be taxable under this law. This means that about one family in 200 has an income in excess of $4,000. How will the farming class average with other workers? This will be a good thing to follow out. We have heard men solemnly argue that because few farmers are mentioned in "Who's Who In America" it follows that farming is not a leading profession. This is nonsense, because the standard for "Who's Who" is literary or professional. A man might be the best practical farmer in the country and still fail to be known as "Who." Another man might be able to write about the first man's success and be recognized. The income tax, however, will sort them out in another way.

*

WHILE the new tariff and imports of mutton from South America may have the effect of reducing the larger flocks of sheep we think thousands of new smaller flocks will appear. Many of our orchard and fruit farms can easily support a few sheep—in fact such flocks are needed. The sheep will clean up weeds better than any other animals, make good use of farm refuse, and prove better than hogs for use in orchards. They give meat, lambs and wool in return. Formerly the small lots of wool could not be sold to advantage, but now a system of direct dealing with manufacturers is developing. Under this the wool can be sent direct to the factory and traded for yarn or finished goods. This gives the owner of small flocks the chance to partly clothe his family without selling at a 35-cent dollar and buying with a 200-cent dollar.

*

THE Hope Farm man is something of a sport in this egg contest proposition. His scrubs seem to be birds that have gone back from "utility" close to nature. By "utility" we mean the ability to produce food—both meat and eggs—for we understand the chief design for poultry in the world's economy is to feed the human race. These scrubs, through hard usage and "natural" breeding seem to have gone back on the road to nature, or that condition in bird life which induces them to lay only about enough eggs to reproduce their kind. They were entered in this contest for several reasons—one a desire to see just how many eggs such a bird can be induced to lay under the most favorable conditions. Now we also believe that continued breeding for show room points or for fancy points also takes a bird away from what we consider "utility." The scrub goes back to nature while the "fancy" fowl goes further away from the strong egg producing bird which we call our egg-laying machine. Our own experience with prize winners has been limited, but we have bought a few, and they rarely laid over 60 eggs a year. We find that this belief is shared by a large proportion of the men who depend upon eggs and meat for all or part of their income. We think it is now up to the American Poultry Association to disprove it, as they can readily do by entering a pen of high scorers at one of the laying contests. No one questions the accuracy or fairness of the management of these contests. Let the A. P. A. enter a pen of high scoring birds, and, if they make a good record as layers they would silence the argument against "blue ribboners" and do the fancy breeders more good than anything else that could happen. If the A. P. A. will enter such a pen THE R. N.-Y. will agree to enter a pen of the same breed or of mongrels selected from a "utility" type. Come, gentlemen, here is your chance to prove that "fine feathers make fine birds."

MR. STEDMAN called Walton "a whitewashed sepulchre of mendacity, who used a razor dipped in oil to part farmers from their money" and spoke about "the angels weeping in Heaven to-night if you give Walton a verdict."

Now gentlemen, run over the list of characters you have ever met and see which one could fit properly into this description! This language was used at a recent court trial at Batavia, N. Y. Bert Walton of Indiana is a tree agent. He bought Catalpa trees at about $3.50 per 1000, wrapped them well in guff and sold them to New York farmers at $20! After learning how they had been treated the dupes refused to pay and Walton brought suit against James Pettibone to recover $40. A little story of the trial is told on page 110. The above remarks were made by lawyer Stedman, who represented the farmers. Can you beat his description of the guff-dispensing tree agent? Walton lost his case, and richly deserved to, and he may yet be prosecuted criminally for false statements in selling the trees! In this trial the lawyers for the agent tried to make much of the point that farmers who bought the trees knew just what they were doing. One farmer on the witness stand is said to have made this naive statement:

I just believe this much, that I was a darned fool when I signed the contract for trees, because any man who would believe fence posts could be grown in two years from seedlings don't know he's living.

A first-class guff-slinger can make a man believe black is white until he gets the black letters of his name upon the white paper. Those Batavia farmers who combined and fought this tree agent have set us all a good example in coöperation that has teeth in it.

*

I HAVE often read in the farm papers that before buying fertilizer one should submit a sample to his State Agricultural Department for analysis. I did so, and am informed that "this being a public institution we do not do analysing for private parties." That is all the State Department amounts to for me. I send sample of same stuff to you. Will you please tell me what it is? A. B. K.
West Pike, Pa.

The substance seems to be ground limestone. It would require a chemical analysis to determine whether it contains phosphoric acid. THE R. N.-Y. has not stated that the experiment stations will make free analysis. We think they ought to be required to do so, and furnished with money enough to enable them to carry out the work. At present the departments and the stations collect samples of fertilizer and have them analyzed. The figures are printed, but they are only of general use to a farmer. For example, a farmer is to buy fertilizer this year All he can get is the record of *last year's goods*. This of course indicates the general reputation of the manufacturer, but he cannot tell just what he is buying unless he pays for an analysis out of his own pocket. The same is true when he buys lime or ashes or waste substances. The fertilizer laws are designed to protect him, but under the present method it is an indirect protection. He must pay for any direct benefit. In Florida the State chemists are required to make analyses of commercial fertilizer or fertilizing substances sent by farmers. We think something of the same plan is followed in Massachusetts. It would be impossible for the stations in the States where fertilizers are heavily used to analyze everything which farmers sent them without a great increase of chemists and expenses. We think the States might well afford to spend the money needed to give farmers this direct protection.

BREVITIES.

RUNNING water saves walking mother.

AS the twig is bent by a bad example the tree becomes crooked.

A FEW years ago little if any corn was grown in Manchuria. Now there is a market for corn shellers.

A GOOD reading circle gives a country neighborhood a square deal at reading.

REMEMBER this Alsike clover can endure on an acid soil far better than Red clover or Alfalfa. The next article on acid soil will show how some plants get their food.

THE questions about handling muck are pouring in. There never were so many before. People who have been trying fertilizers which have been brought from many corners of the earth begin to realize what is in the old swamp.

MANY Northern farmers are fighting the meat trust with frost. Instead of selling a fat cow for what the buyers will give they slaughter, sell the hide and freeze the carcass, and keep it packed in snow—cutting from it as wanted. Usually neighbors will take one or more quarters.

WE have followed up that report of profit in raising Belgian hares. It is apparently correct as to special prices obtained for the hares, but we find that many of them were sold as breeders to foreigners, who keep them in city quarters. Few were actually sold as meat, and we doubt if the meat market alone would make the business profitable.

WORKMEN'S COMPENSATION IN CONNECTICUT.

If my hired man gets hurt, while he is actually working for me, I have to settle his doctor's bill, and pay him half wages for the time he is laid up. That is Connecticut's new Workmen's Compensation Law in a nutshell. Of course there are explanations and exceptions. The employer is not obliged to furnish a doctor after 30 days. The compensation payments actually begin with the third week of disability. The amount must be at least $5 per week, but cannot exceed $10. For total disability the weekly payments run 10 years; for lesser injuries and for death, in accordance with an elaborate schedule contained in the act.

To appreciate the status of the farmer under this law, it is necessary first to consider the influences that brought about its passage. Workmen's compensation is primarily a development of the ancient common law principle, that the master is bound to provide safe conditions under which the servant may work. Heretofore, however, the servant was never supposed to recover damages for injuries resulting from his own carelessness. In the olden days, when the common law was being formulated by the judges of England, workingmen could not vote, and therefore had little or no political influence. As a natural consequence, the obligation of the master to safeguard the life and limbs of his servants was reduced to a minimum by two famous decisions. One of these laid down the principle that any man who went to work on a dangerous job, thereby assumed the risk of injury. The other held that no man could recover from his employer for injuries caused by the act or negligence of a fellow servant. These English decisions were afterwards cited as precedents in American courts, and receiving judicial approval, promptly became the law of the land.

When these decisions were first made in England, it is not likely that hardship to more than a very few individuals was involved. The trouble came in with the evolution of industry and the development of the factory system. The advent of the corporation did away with the old personal relations between master and servant. At the same time, the protection afforded by the doctrine of assumed risk and the fellow servant rule, made many employers seemingly indifferent to the physical welfare of their employees.

The situation in Connecticut up to 1911, was aggravated by a system of legalized court procedure, which kept the injured party from getting his case tried before a jury. The defendant employer had only to make a technical default by admitting to the court his liability for damages. The amount payable was then fixed by the judge, after listening to the evidence on that point. In this way the element of sympathy, often a large factor in verdicts rendered by a jury, was pretty thoroughly eliminated. Agitation for radical changes in these Connecticut laws began in earnest about five years ago. Public opinion was thus developed to a point where the Compensation Law passed the Legislature almost unanimously. The act, when passed, was not supposed to affect ordinary farmers or householders. Exemption was provided for all those employing less than five hands. The Attorney General, however, has recently ruled that the small employers who desire exemption must claim it by filing papers with the Compensation Commissioner, and giving written notice to their employees. The blank forms for these notices may be obtained from the town clerks, who can also give the name and address for the Compensation Commissioner of his district. There are five of these Commissioners appointed by the Governor to administer the details of the Compensation Law, and see that the injured workmen get their just dues.

The farmer is, in theory, entitled to retain the old common law defenses (contributory negligence, assumed risk and the fellow servant rule) against personal injury suits. Whether that privilege is worth anything now is to say the least doubtful. The law has been changed so that any man can have his case tried before a jury. Meanwhile public opinion has so turned against the old common law defenses, that an ordinary jury would be apt to ignore them, at least to some extent. In doubtful cases, the chances would be mostly in favor of the injured man, which fact will make claimants under the old law the more ready to bring suit.

Fortunately for the Connecticut farmers, the insurance companies are offering them policies which cover all their obligations under the Compensation Law, for around $10 per year. The doctor's bills, weekly payments, funeral expenses and the costs of settling claims or defending suits, will all be taken care of for the sum named. I understand that the farmers of this vicinity are taking out these policies very generally. Personally I would not think of doing otherwise. I could not serve my hired man with a non-compensation notice without causing a feeling that would be more costly to my business than the policy. Also I am satisfied that the better class of farm hands will avoid the employer who is not prepared to allow them the benefits of the Compensation Law. C. M. G.

Hartford, Conn.

FARMERS AND THE INCOME TAX.

I want information as to how a farmer should figure out his income that comes under the new income tax law. I should like to know what should be done in regard to products grown in 1912 and still on hand March 1, 1913? I should also like to know what should be done in regard to crops grown in 1913 and on hand January 1, 1914, or shipped on commission and no account sales received on or before January 1 for goods shipped the latter part of December? I should also like to know whether the cost of setting out new orchard, laying tile drain, building fences, cleaning and putting under cultivation new land should be figured as expense or put under the head of permanent improvements? H.

Products grown in 1912 and still on hand March 1, 1913, may be inventoried as of March 1, 1913, at their supposed value, or they may be disregarded entirely. The latter is preferable. Crops grown in 1913 and still on hand January 1, 1914, or in hands of commission men or no account sales received should be inventoried at their supposed value. If disposed of before the "return" has gone to the Revenue Collector on or before March 1, the return may be corrected. The cost of setting out new orchard, laying new tile drain, clearing and putting under cultivation new land should be charged to permanent improvements. If the fence built is around the new land that should also be charged to permanent improvement. However, if the tile drain is work of taking up an old drain and replacing with new of same size, it should be charged to operating expenses. If a new fence is built in a new place anywhere (except for temporary purposes) charge it to permanent improvements. Repairs to old equipment or a structure of any kind, building, fence, drain, orchard, tool, etc., should be charged to operating expenses. A new structure of any kind in a new place should be charged to permanent improvements. When an old structure is replaced by a new one in the same place and the new structure is of the same size and character as the old, merely replacing it "in kind" it should be charged to operating expenses. But if the new structure replacing the old one is of a better character than the old one, the excess value of the new one over the old should be charged to improvements. For example, a woven wire fence may replace a board fence. The board fence may cost 20 cents per rod and the wire fence 30 cents per rod. Charge the 20 cents per rod to operating expenses and the 10 cents per rod to improvements.

A BRIEF REVIEW OF THE INCOME TAX.—The Federal income tax law is part of the new Underwood-Simmons tariff law passed October 3, 1913. This law reduced import rates on many articles and placed other articles on the free list. These reductions would lessen the revenue of the government, and the income tax is to offset the loss. The law reads: "That there shall be levied, assessed, collected and paid annually upon the entire net income arising and accruing from all sources in the preceding calendar year to every citizen of the United States, whether residing at home or abroad, and to every person residing in the United States, though not a citizen thereof, a tax of one per centum per annum upon such income, except as hereinafter provided; and a like tax shall be assessed, levied, collected and paid annually upon the entire net income from all property owned and of every business, trade or profession carried on in the United States by persons residing elsewhere." The "foreigner" helps us pay our National tax. This tax of one per cent. is called the "normal" tax and is paid by corporations as well as by individuals. It takes the place of the Corporation tax of the Payne-Aldrich law.

DEDUCTIONS FROM GROSS INCOME.—"In computing net income for the purpose of the normal tax there shall be allowed as deductions: First, the necessary expenses actually paid in carrying on any business, not including personal living or family expenses; second, all interest paid within the year by a taxable person on indebtedness; third, national, State, county, school, and municipal taxes paid within the year, not including those assessed against local benefits; fourth, losses actually sustained during the year, incurred in trade or arising from fire, storms, or shipwreck, and not compensated for by insurance or otherwise; fifth, debts due to the taxpayer actually ascertained to be worthless and charged off within the year; sixth, a reasonable allowance for the exhaustion, wear and tear of property arising out of its use or employment in the business, but no deduction shall be made for any amount of expense of restoring property or making good the exhaustion thereof for which an allowance is or has been made: Provided, that no deduction shall be allowed for any amount paid out for new buildings, permanent improvements, or betterments, made to increase the value of any property or estate; seventh, the amount received as dividends upon the stock or from the net earnings of any corporation, joint stock company, association, or insurance company which is taxable upon its net income; eighth, the amount of income, the tax upon which has been paid or withheld for payment at the source of the income." Money or other things of value, disposed of by gift, donation, or endowment shall not be deducted from the income. Also there shall be excluded from the income the interest on the obligations of the United States and its possessions and of any State or subdivision of a State. The above deductions apply to individuals and corporations.

EXEMPTIONS.—There is an exemption of $3,000 from the income of an individual making a "return," plus $1,000 additional if the return is that of a married man or woman. If the husband and wife each have an income exceeding $3,000 they can claim but one exemption, unless they are living apart permanently, and then each may claim the $3,000 exemption. Salaries paid by a State or any subdivision of a State are exempt also. Salaries paid by the United States are not exempt except that paid to the present President and the judges of the Supreme and Federal courts now in office. The Senators and Representatives and Vice-President pay the income tax.

ADDITIONAL INCOME TAX.—On incomes exceeding $20,000 a year the following "additional" income tax is levied and collected: $20,000 and not exceeding $50,000, 1%; $50,000 to $75,000, 2%; $75,000 to $100,000, 3%; $100,000 to $250,000, 4%; $250,000 to $500,000, 5%; above $500,000, 6%.

Who makes a "return" or statement of net income? Everyone with a net income of $3,000 or more, even when the exemption is $4,000 or more. The "return" is for the full calendar year except for 1913, it is for 10 months only from March 1st to December 31st inclusive. Five-sixths of the deductions and exemptions for a year are allowed. If part of one's income exceeding $3,000 is regular and paid in the form of salary or interest on bonds totaling over $3,000 a year it is to be withheld at the "source," and the one making the "return" must notify the "source" by February 1st that he claims his exemption. The "return" must be delivered to the Revenue Collector March 1st. He has until June 1st to verify and correct it and notify the taxpayer and the tax must be paid in June on penalty of 5% added and 1% a month till paid. The person paying must send the tax to the Collector instead of the Collector coming for it. The "return" must be made under oath.

Gains arising from the increased value of real estate are to be included in this tax. Take for illustration a purchase of a farm for $10,000 in 1913 after March 1st and sold three years later at $13,000. The gain of $3,000 is a gain to be returned in the year ending Dec. 31st, 1916, at 1% of tax, or it may be prorated over three years, $1,000 for each year if the taxpayer desires. If the property is purchased previous to March 1st, 1913, the increase may be prorated over the whole period and is taxable only on the prorate gain for the time the law has been in force.

This tax will call for some knowledge of bookkeeping. Every farmer should keep an accurate account of the farm operations. He should know what every crop costs to produce and market. He should know what every field is producing and the cost. He should know what every animal in his herd is making in profits (if he is a dairy farmer and is aiming at the best results). Some of our large factories know to the fraction of a cent what every article produced costs when finished. The income tax law may be worth all it costs to our farmers if it compels an accurate account of farm operations. The Sixteenth Amendment to the Constitution seems to indicate a purpose to gather a part of the Federal revenues from incomes. A fair trial of the law is now expected. There is a *penalty of from $20 to $1,000* for neglecting or refusing to make a return. Corporations are fineable $10,000.

F. N. C.

We find a big demand for seed potatoes which have been certified by the Department of Agriculture as true and clean. There is a good chance for careful men to enter the business of producing such seed.

Woman and the Home

From Day to Day

SOMETIME.

Sometime, when all life's lessons have
been learned,
And sun and stars forevermore have set,
The things which our weak judgments
here have spurned,
The things o'er which we grieved with
lashes wet.
Will flash before us out of life's dark
night
As stars shine most in deeper tints of
blue,
And we shall see how all God's plans
were right,
And how what seemed reproof was love
most true.

And we shall see how, while we frown
and sigh,
God's plans go on as best for you and
me;
How, when we called, He heeded not our
cry,
Because His wisdom to the end could see.
And e'en as prudent parents disallow
Too much sweet to craving babyhood,
So God, perhaps, is keeping from us now
Life's sweetest things because it seemeth
good.

And if, sometimes, commingled with life's
wine,
We find the wormwood, and rebel and
shrink,
Be sure a wiser hand than yours or mine
Pours out the potion for our lips to drink.
And if some friend we love is lying low,
Where human kisses can not reach his
face,
Oh, do not blame the loving Father so,
But bear your sorrow with obedient
grace!
And you shall shortly know that length-
ened breath
Is not the sweetest gift God sends his
friends,
And that, sometimes, the sable pall of
death
Conceals the fairest boon His love can
send.
If we could push ajar the gates of life,
And stand within, and all God's working
see,
We could interpret all this doubt and
strife,
And for each mystery could find a key.

But not to-day; then be content, poor
hearts,
God's plans like lilies pure and white un-
fold;
We must not tear the close-shut leaves
apart—
Time will reveal the calyxes of gold.
And if, through patient toil, we reach the
land
Where tired feet, with sandals loosed,
may rest,
When we shall know and clearly under-
stand,
I think that we shall say that "God knows
best." —Mrs. May Riley Smith.

*

WE were recently asked to reprint the following recipe for mincemeat, given in 1907 by a western reader who said it gave great satisfaction when canned and sold to private customers. Its peculiarity is that it has no spice: Chop fine separately three pounds of cooked lean beef, two pounds of suet, and one peck of tart apples. Add two pounds raisins, half pound of sliced citron, one-fourth pound of candied orange peel, one quart of canned cherries, pitted, one pint of apple butter, two cups of cider, two pounds of currants, one glass of orange marmalade, one quart of grape juice and two tablespoonfuls of salt. Scald, and store in fruit jars like canned fruit.

*

A RECENT press bulletin sent sent out by the Department of Agriculture refers to the use of suet in cooking, and deplores the fact that much of it, in this country, is thrown away or used in soap-making, instead of cookery. We think, however, that farm housewives at least are not in the habit of wasting good fat, nor have we met with cook-books that teach us suet is only good for soap-making. The circular gives the following recipe for making a mixture of lard and beef suet, which will be found useful:

Take two parts of suet and one of leaf lard, finely ground, and mix together. Render this with whole milk in the proportion of one-half pint milk to two pounds of the mixed suet and lard. (Render means to melt down or to clarify by melting). The suet and lard mixture may be finely divided by passing it through a meat grinder, and may then be heated in a double boiler, when the fat will be quickly released from the tissues, and when allowed to cool will form a cake on the surface of the liquid which may be easily removed. This fat has a good odor, color and texture, and is softer than the suet alone. It is useful for frying and the shortening of foods with high flavors and may be used with fair results in shortening such things as baking powder biscuits. It is useful for cooking vegetables either alone or with the addition of a little butter.

In our own locality, beef suet costs 12 cents a pound, and we have to beg the local butcher in advance to get it for us. If anyone is throwing suet away, it certainly is not the housewives, and we doubt whether the packers and oleo men are wasting much of it either.

*

NOTHING gives one a better introduction to a stranger than a well-written letter. The fine art of letter-writing is born in one, rather than acquired, but that is no reason why an ordinary communication should not be readable, neatly written, properly spelled and punctuated. And how few letters come up to this modest standard! The writing may be so indistinct that, as Aldrich said of Prof. Morse's caligraphy, "all the t's look like w's, and the i's have no eyebrows." Then the writer may have a taste for shiny paper, and a fondness for a purple lead pencil, which compels the unlucky recipient to slant the letter at a certain angle before it can be deciphered, because the gloss of the paper makes the pencil marks almost invisible. Persons who have been denied educational opportunities are not by any means the worst offenders; there are entirely too many cultivated people who forget that writing is speech made visible. So we put legibility first, and for this a letter demands dull finished paper and black ink. The writing should be distinct, not too small, and the lines should never be crowded together. If we add to this simple diction, which expresses the writer's meaning, we have a letter to gladden a busy reader, and one that conveys an excellent impression of the writer's intelligence. Where early education has been limited, it is quite possible to correct errors in speech or writing by the use of some little book designed for this purpose. "Mistakes in Writing English," by Marshall T. Bigelow (price 50 cents), is an excellent book for this purpose, and we might add to this. "A Handbook of Conversation," by Andrew P. Peabody (price 50 cents), which points out common errors in speech and pronounciation. As a final suggestion in desirable letter-writing, we might add a warning against fancy note paper. No one ever errs in using paper of convenient size, white, cream, gray or dull blue, absolutely without ornamentation, but when fancy colors or decoration are chosen there is always risk of some exaggerated absurdity. Good taste in correspondence, as in most other things, is based upon sincerity and simplicity.

Making Over a Boy.

To listen to most present-day mothers, the children they have known from the hour of their birth present so many complicated and varied problems that one would surely think the task of being a mother was almost too great to be worked out in these progressive times. Every woman has a theory, if not two or three, and the children are the victims on which she tries them. Everyone says this is the "age of the child," and it must be, for little else is talked about. But if a woman with no children ventures an opinion she is immediately "sat upon" by the up-to-date mothers.

I have been sat upon so often on the child question that one would suppose I had long since meekly given up all my theories, but not so. When a little child came into my heart and home last year, a little boy about whose ancestry I knew nothing, I determined to show some flesh and blood mothers a thing or two about my despised theories. The little orphan was so poorly nourished and badly fed that he could hardly walk across the room without falling down, and his sleep was so broken and he was so restless in the daytime that many mothers would have put him down as nervous on the spot. But one of my theories is not to talk to children about their nerves, so that subject was never mentioned in his hearing.

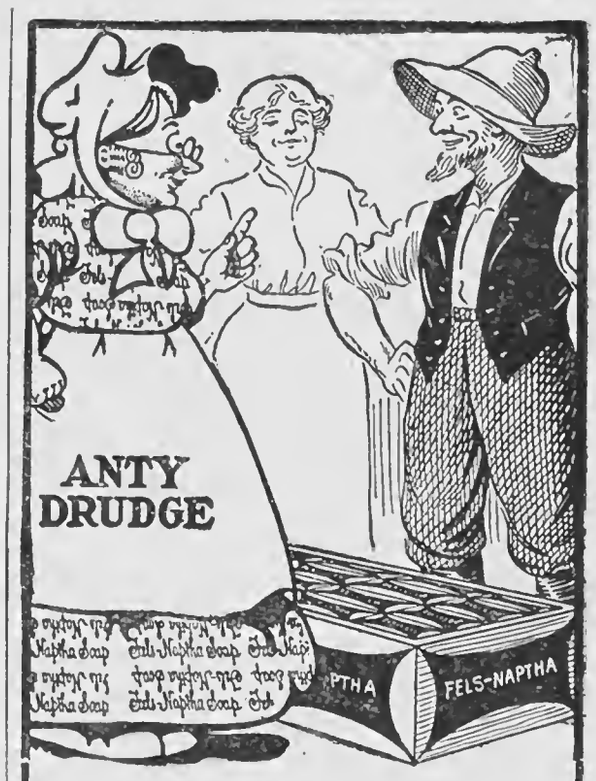
It isn't a long story, but to me it is an interesting one, and it may help the mothers of such children. No attempt was made to teach the boy anything at all at first, except that we loved him and wanted him to be happy. Every defect was ignored, and he was never corrected. He was treated much as farmers treat little animals that they want to grow up sturdy and healthy. At half past six each evening he went quietly to bed in a well-ventilated dark room, without the exciting game of romps that some people allow their children. He slept very fitfully at first and cried out a great deal but gradually he settled down into what looks like dreamless sleep. In the morning he was allowed to waken naturally and have his breakfast at eight. Generally he sleeps from half past six to half past seven next morning.

His food is quite simple and consists mostly of milk, eggs, fruit, chicken, soups, bread and butter and honey. He will not eat meat except chicken, but I do not try to force him. His meals are as regular as the clock, and so are his "pieces." He must have an apple or bread with thick butter or an orange for his lunch. If he refuses this he must wait till meal time. He was sallow, dyspeptic, hollow-eyed, thin and bloodless when we received him, so I determined to see what good feeding would do. He has three or four pieces of good candy every day right after dinner and that is all.

His clothes are never fussy, but warm and comfortable. His pleasures are simple. He ran wild on the farm all Summer in little rompers, and grew sunburned and happy. With his tin can containing his mid-morning luncheon he happily tagged the men during haying and harvesting. He has never seen a moving picture show, has never been kept up late so his parents could go to a party or social, has never lost an hour's sleep, except on Christmas Eve, when as a great treat he was allowed to be up till eight o'clock at a little Sunday school entertainment, and he certainly never has been allowed to go to bed excited and exhausted. Somebody holds him quietly and reads to him after supper, so he gets to bed happy. Only happy, gentle and soothing stories are told at bedtime.

In less than one year he had grown four inches, gained six pounds and has turned from a timid, scared, delicate, unhappy little boy to a noisy, shouting, romping healthy youngster. He has forgotten every one of the stories he used to tell of his old life, he doesn't know his name any more, and he knows to a certainty that we are his firm friends. He eats and sleeps and plays and grows and that is his short history. We think, and our friends tell us, that he is entirely made over. At first he would stand at the window gazing out at nothing with a frightened, pathetic look on his thin little face, but now he is engaged in coasting, kicking his football, playing marbles and everything boys love, so he has no time to be sad. His whole face has changed, as we know from his pictures, and we feel sure that our great trouble in the near future will be to keep enough food in the pantry for his appetite and enough trousers and stockings on hand that he may look presentable. His dyspepsia and nervousness and crying spells and peevishness are gone, never to come back, we think, but all the same we haven't relaxed our system a bit. He will continue to get 13 hours of sleep each night as long as he will take it, and his meals will receive care and thought as long as he is growing, if I live to look after him. I can see that wonders have been accomplished during the time we have had him, but there is more to be done. So far my "bodily" theories have worked beautifully, and time will tell what my intellectual theories will work out. It has been an interesting and profitable occupation, and promises to be more interesting as the days go by. Many of my friends pity me that I have to give up this or that, but I count it all joy to have a small share in the building up of a sound body, and seeing a little life expand in the sunshine and warmth of a home life that he never knew before. HILDA RICHMOND.

MEAT SOUFFLE.—Make a sauce of one teaspoonful butter, one tablespoonful flour, one cup milk or stock, dash of salt and pepper. Stir into sauce one cup chopped cooked meat (chicken is excellent); one-half cup bread or cracker crumbs. Remove from fire, add yolks of two eggs, beat light. Fold in whites beaten stiff. Put in greased baking dish, set dish in tin of water. Bake 40 minutes or until light brown. I find this recipe very useful; ham is not quite as good as fresh meats. MRS. R. T. H.



Farmer Medders: "Here's your box o' soap, Maria. Good morning, Anty. Maria keeps me buying her Fels-Naptha Soap now. Won't use anything else. Seems to me she's getting most too spry these days, with no work to do. That boarder rode to town with me today, and she asked me, 'Don't you ever come to the city to see the sights?' And I sez, 'Oh, no; we see 'em every summer.' Ha! ha! Well, seeing you don't need wood for a fire or anything, I'll go out to the barn and let you get your washin' done. I don't have to help any more, Anty, since Maria's using sense and Fels-Naptha Soap."

There is no need for women to be tired and sick from overwork. Fels-Naptha Soap will cut your work in half. It is the easy way of doing all the disagreeable parts of housework.

Use Fels-Naptha in cool or lukewarm water for your weekly washing, housecleaning—everything you have to do. Clothes washed with Fels-Naptha do not need to be rubbed hard, nor boiled and are on the line in half the time it used to take.

For making your work easy, use Fels-Naptha Soap and follow directions on the red and green wrapper.

Better buy it by the box or carton.

The Rural Patterns.

When ordering patterns always give number of pattern and measurements desired.

8093 Surplice blouse for misses and small women, 16 to 18 years. With long or three-quarter sleeves. 8126 Fancy blouse for misses and small women, 16 to 18 years. With long or three-quarter sleeves. 8113 Coat for misses and small women, 16 and 18 years. With Raglan

sleeves, with or without belt. Perforated for shorter length. 8123 Three-piece skirt, 22 to 32 waist. With or without circular ruffles, with high or natural waist line. 8098 Skirt in peg-top effect, 22 to 32 waist.

8111 Boy's blouse, 6 to 12 years. With separate collar. 8102 Child's outdoor sleeping bag, one size, 6 mos. or 1 year. 7885 Girl's one-piece dress, 8 to 12 years. With long or short sleeves, with or with-

out tabs. 7974 Girl's dress, 6 to 12 years. With four-piece skirt, long, three-quarter or short sleeves. 7604 Girl's double-breasted coat, 4 to 8 years. With fancy revers and collar. Price of each pattern 10 cents.

Safety First in the Home.

Various municipalities and great corporations are waging a strong campaign for "Safety First." In every hand they have placed placards bearing words of warning. As one goes from place to place he is cautioned against taking risks that might cause injury or death. Forceful speakers go from city to city lecturing on means of safety. People are instructed in safe and sane ways of boarding and leaving trains, trolley cars and autobusses, and are urged to heed the warning bell or gong at crossings. In foundries, mills and factories, the employees are assembled and instructed in safe ways of handling dangerous materials and machinery. Every one of these cautionary measures I heartily endorse. I believe that the result will be increased thoughtfulness on the part of many who have heretofore been thoughtless and careless of their own safety and that of others. While the campaign has so far been considered a public one, it would be well for us to consider the subject of safety first in relation to our home life. Every day we read of accidents which would not have happened, had some one considered safety rather than haste, or speed, or temporary convenience. Perhaps they didn't think. Perhaps they only did what they had often done before, and never realized the danger risk.

Undoubtedly the commonest source of danger to life and property in the home is from fire originating at the source of heat or light. Many homes are destroyed every year through sheer carelessness. A faulty chimney is allowed to go without repair long after its fault is known. An unused stovepipe-opening is left uncovered in a chimney receiving another pipe, which is used. The broken side or door of a stove is left unprotected. A slow fire is hastened with a dash of kerosene. A lighted lamp or lantern is filled without the blaze being extinguished. The result in any case is the same—loss of property or life. Little children are all too often the victims of their elder's carelessness. It sometimes seems that homes where little children are should be furnished with placards on which under the caption of "Safety Fi't" should be printed a few common sense rules which many do not now heed. Wash-day in an ordinary kitchen, is a day of danger to small children. Boilers, tubs, and pails of hot water are left in positions that seem to invite investigation. A little hand bent on such investigation is often strong enough to overturn the the scalding water with fearful results. One cannot be too careful about these things. When turning the boiler aside to place wood in the stove, do you move the boiler outward, so that only one side balances, uncertainly on the edge of the stove, or do you push it back, allowing it to rest securely on the stove-top? Do you let the spout of your teakettle protrude over the edge of the stove and send up little puffs of steam, to allure a child into grasping at them? Do you take hot covers and griddles from the stove-top and place them on the hearth directly in the reach of childish fingers?

Do you allow matches to be strewn promiscuously about in every room, to tempt a child into lighting them? Wouldn't it be safer and saner to give more thought to these apparent trifles? All matches should be kept high beyond the reach of little fingers. One or two match-safes kept well filled will meet the needs of an ordinary family. It may at first seem inconvenient to have to go from one room to another for a light, but a little forethought will save steps. Once the habit of care and safety is established it will be found well worth while. Here is another rule which ought never to be broken: Do not place a lighted lamp on a stand or table having an overhanging cover, which a child might grasp, overturning the lamp.

Danger is not always confined to stoves and lamps, however. The open stairs or open doors leading to them are a source of danger to little folks, who are ever bent on exploration, but have not acquired sufficient control over their limbs to make stair-climbing safe. No door at the head of a cellar stairway, should be without a bolt or hook, put in place *every time* the door is closed. I cannot in this space point out all that makes for danger or safety. It would be well for every man and woman to look about their own home and discover, for themselves, its danger spots; discover and abolish. In your everyday work about the home, especially where there are little children, learn to do things in the safest way. Sometimes you may have to sacrifice a little of ornamentation or convenience but strive for "Safety First."

E. D. M.

Success in industry, in art or in love is saved from bitterness and disappointment because we regard our achievements far more symbolically than we know, and rest far more than we are aware upon the backing of God.—Dr. Richard C. Cabot.

Spear's Room-Size Brussels Rug
Only $11.95
$1.50 Cash
Balance, 75c a Month
Order No. D 4736

Beautiful high color Brussels Rug, size 9x12, red rose design, green leaves and tan ground. Guaranteed full 9-wire Tapestry Brussels with wool facing. This is the greatest genuine Brussels Rug value you ever saw. 400,000 Settlers a Year

Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms in Manitoba, Saskatchewan and Alberta.

Lord William Percy, an English Nobleman says:

"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."

New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.

For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent.

Live Stock and Dairy

SUCCESS WITH WINTER LAMBS.

When we hear of a neighborhood where some crop is being grown out of its season and brings an unusual price, we think at once that some wonderful way of handling that crop has been discovered. We'll go right at once, we think, and find out how to get rich in a hurry. When we arrive, we usually find that common sense, patience, good care and a lot of other rather distant acquaintances of ours have been on the job. There may be ways of getting rich in a hurry by manipulating inanimate things, but the man who thinks he can make a fortune out of any line of farming without paying for it with hard work and much thought may as well quit the dream. Lately I visited a neighborhood in Chester County, Pa., where a few farmers were making an unusual success with Winter lambs. One of them had 64 lambs dropped this Fall, and by the last of November had sold 47 at $10 apiece. The remainder he expected to be rid of before Christmas. A tidy little sum to start the new year with, wasn't it? And what's more, he would not have to feed any grain all Winter, like the rest of us who

A NICE LITTLE BUNCH OF LAMB.

have our lambs coming in the dead of Winter or early Spring. Why shouldn't we do like him? What's his secret?

No secret at all! Anyone can do it—if they know how! The best I can do is tell how those ewes were fed, how they were bred, and one or two little things in their management that struck me. The country up about West Grove is somewhat rolling, just what I would call a natural sheep country. Plenty of broad fertile pastures, good water, and handy transportation. The stock originally used was native sheep bred to Dorset rams. This provided splendid mothers and milkers, that bred early and made the very finest of mutton. No sheep when dressed, so one of my friends there stated, could equal a Dorset for the quantity and quality of lean meat. No other mutton equals it in money value. But in the artificial early lamb we want more of a roly-poly than we get with the Dorset. Also, the Dorset does not always breed early enough. The early lamb people of West Grove began to look about for something to fill the bill. They found out about the Tunis sheep; heard they bred earlier and fattened easier, so they bought Tunis rams. They believed in good breeding, so they bought good ones; $25 for an animal was not too much to pay for insuring a crop that meant $500 or more to each one. That was one point where they differ from many of our sheep growers. There is no economy in a cheap ram. This cross, the Tunis on Dorset ewes proved just what they wanted. The Dorset furnished the frame and size and milking qualities, the Tunis the early breeding and the roly-poly lamb.

Now, they had their breed mixture right, the next proposition was to do the mixing at the right time. For Christmas lambs the ewes must be bred in April and May, before the hot Summer nights come. A curious fact was noted that a lot of lambs would be born say the last of September and no more until 10 days or two weeks later. Since a few days may mean dollars in the price of a 40-pound lamb, this is a point we need to know more about. Until some experiments can be accurately carried out along this line, and a temperature record kept, we will hardly know how important the weather conditions may be in stimulating breeding. In practice, the ewes are in good flesh before the breeding season, but not too fat. They are then turned on scant pasture for a couple of days to get good and hungry. Toward evening they are given a light feed of shelled corn. Then the ram is turned with them. He needs also to be brought into prime condition by individual feeding. Oats and clover or Alfalfa hay are a good combination. The ram is handled in a number of ways. He is usually kept up during the day to be turned with the ewes at night. When possible two rams are kept to be used alternately. Often a young ram lamb is turned with the ewes before the older animal, and is kept in the flock with him. One can only conclude that the breeding practice is largely guesswork, and until we have made more careful study of breeding conditions we'll have to try every expedient that may in any manner help.

It is hardly worth while to mention that the ewes are kept in prime condition during the months following breeding. The splendid clover pastures about Chatham and West Grove take care of that. How many ewes to the acre you ask? I asked that question too. I'll give you the answer I got. Just as many as will stay in good condition and not hurt the pasture. Being a sheep man myself, I knew that was the only answer that would fill the bill. All you can do is watch your ewes and see that they are doing well. Change pasture if they need it or give them a little extra feed if they seem likely to want it. Always have plenty of water on hand that is fit to drink.

The ewes stay on pasturage until the lambs come, and in some cases for some time afterward. The longer we can feed them that way the cheaper it will be, and our profits from the lamb greater. Also we can guarantee a real fat lamb. The only kind that pays is one that is born fat and does nothing but get fatter. A poor lamb is dead waste. Dressed it looks for all the world like a skinned cat, and is worth very little more. The lamb for this early Christmas market is straight hothouse goods. Like a hothouse plant it must be carefully handled. It should have little or no exercise. It should never miss a meal. It should have cracked corn and bran as soon as it will eat. Nothing should ex-

cite it or be allowed to interfere with its appetite. Even its death should be as swift and mild as possible after its removal from the ewe. We are working for a perfect, smooth, white meat that the slightest rough handling will spoil. Like a cut flower, unless handled with the utmost gentleness, the hothouse lamb hauled any distance or scared before killing will "wilt," ruining the fine texture of the meat.

After lambing the ewes were fed largely on Alfalfa hay. Indeed, all of the most progressive growers depended on Alfalfa to keep their ewes in flesh and milk. A mixture of oats, bran, and cracked or whole corn to both lambs and ewes was pretty generally used, special pens of course being made for the lambs to run into. Cornmeal was held in very low esteem. Several doubted if the corn should be even crushed or cracked before feeding. Salt was usually kept before the ewes constantly. Plenty of pure water was also provided. As one breeder expressed it, *taking care* was what counted; namely, clean feed, pure water, salt, plenty of fresh air, anything to keep the appetite on edge and the lambs growing. I do not think too much emphasis can be put on these points. The ewe going stale from being shut in, having too much grain, or drinking foul water or not enough ruins many a lamb crop, putting it in the skinned-cat class.

The best housing arrangements for the health of the sheep that I saw was an open front basement of a barn, divided into sizeable pens and with exercise yards of an equal size attached. Plenty of fresh air, all the exercise they needed; just the combination to keep both ewes and lambs in keen growing condition. The main lesson of that trip to my mind was the need of studying breeding conditions and the value of strict attention to details of feeding and housing. Truly, the eye of the master—both of them—should be on his sheep! R. B.

IRREGULAR FRESHENING OF MILCH COW.

Does it have a bad effect on a cow to keep her from breeding for any considerable length of time? The cow in question had a calf last June, but I find it inexpedient to breed her again this coming year unless it is necessary to keep the animal in good condition.

New Jersey. W. W. T.

There exist two dangers of allowing a milch cow to remain open for an indefinite period. In the first place she is less apt to conceive when mated, and in the second place she is apt to go dry for a long period after the mating is finally made in case she does settle. It is customary in large dairies where the calves are not an important item of value to permit the cows to freshen once in 15 or 16 months. Ordinarily, however, for dairy farm practices it is much more desirable to mate them so that they will freshen once each year. This practice stimulates the milk flow, and unless the animal is particularly a persistent milker she is less apt to give as much milk if irregularly bred and not permitted to freshen at frequent intervals. The animal will keep in good condition physically if not bred, in fact she is very apt to put on an excessive amount of flesh, and this is one of the reasons why she is less apt to conceive when mated. Instances are frequent where cows have been used for family purposes and not bred for intervals of two years or more, but it is the exception rather than the rule to have such animals give milk enough to appropriately pay for the care involved in their maintenance. If desired to carry a cow over from Spring freshening to Fall freshening, or if necessary to avoid calving during fly time, the practice is justified. F. C. M.

LIVE STOCK NOTES AND PRICES.

The year 1913 has been a very prosperous one to the Guernsey interests. The work of the office of the Guernsey Cattle Club shows a gain of 60% in the entries of bulls and also those of cows, and a gain of 50% in the number of transfers. The work of the Advanced Register shows an even greater gain. One of the most important changes made during the year has been the combination of the Herd Register with the monthly Guernsey Breeders' Journal, making the issues each month a complete compendium of information valuable to all interested in the Guernsey.

Fall grain is up and doing nicely; weather fine; only a few flakes of snow fell to date (Dec. 29). Tops of highest hills were gray with snow twice this year for a few hours only. Cabbage, carrots, parsnips, etc., still unharvested, are in good condition. Frost has not yet cut down the Dahlias and other flowers, although the tender flowers stopped blooming some time ago. Prunes were a good crop; prices good, best for some time past. Carload lots of prunes shipped from Drain (exclusive of less than carload lots) total $9,100 up to middle of December, with several more carloads yet to be shipped. Cattle good price and scarce; fat steers 6½ cents per pound on foot; cows, 5 and 5½ cents per pound; good Jersey cows, $50 to $100 per head. Potatoes retail at one cent per pound; apples 50 cents per box; celery 10 cents per bunch; sweet potatoes three cents per pound; onions three cents per pound; cranberries 15 cents per quart; Hubbard and other squashes 10 to 25 cents apiece, according to size; eggs 35; butter fat 37; creamery butter 40; rice, broken, eight cents; head rice 10 cents per pound. All prices quoted are at local retail stores. The local demand for turkeys was poor at the holiday season, but large numbers were shipped to the large cities. There was $21,680 worth of sheep, hogs, and cattle shipped from Drain in 1913. More attention is being paid to dairying, poultry raising, and fruit growing than ever before. A new creamery is being talked of here, also a cannery, both of which are needed. L. E. W.

Douglas Co., Ore.

Butter, 42 cents retail, 35 cents wholesale; eggs 38 to 40; potatoes 90 bus.; sweet potatoes 50 cents per ⅝ basket, $1.75 barrel; milk eight cents to family trade; chicken, live, 22, 17 to 18 cents wholesale; dressed 25, 20. C. R. P.

Da Costa, N. J.

Twenty-five farmers near Hartford, Conn., recently organized the first Connecticut Herd Improvement Association. They will start with an official cow tester and have their cows fully tested for "robbers." This work will be under the general supervision of the Connecticut Agricultural College.

LIVERPOOL SALE AND PEDIGREE COMPANY
LIVERPOOL, N. Y.

THE HEN BUSINESS IN CALIFORNIA.

I reside in California. Our Winters are of course mild; no snow and little cold weather, in fact ice seldom forms and days following our cool nights are usually warmer than those following damp nights. To offset the lack of cold we have very rainy weather all Winter long as a rule; say three to four rainy days per week, and on level surfaces the water naturally accumulates in puddles until after two or three dry days in succession, when the ground which is a sandy loam in this section, again becomes reasonably dry. Hens running out in yards get damp feet and encounter foggy atmosphere until say 10 a. m. In my opinion this damp condition has a lowering effect upon the egg yield, and perhaps the system of continuous housing, which I have read much about during late years, might prove beneficial. What do you think of continuous housing system applied in California? I have never known of it being used here on any large scale. I refer to the Corning system of Bound Brook, N. J. How should coops be constructed in following out this idea? I favor this system if it has really proven satisfactory, but am inclined to divide up the flock in say 150 to the pen rather than say 1,500 together. E. W.

I do not favor the Corning system or any other large housing system for California, because, first, it is too expensive for houses; second, in California such a system is not necessary. In the mild climate of the Santa Rosa section, and in fact for all of central California, the most successful poultrymen handle their flocks in units of about 100 fowls in inexpensive houses, tight on three sides and open to the front, giving as large a yard as the grounds will permit. One of our most successful poultrymen, a man who has made a success of the business for 15 years, handles his 1,500 White Leghorns in 100 flock units, with an acre of ground to the flock; one-half of the acre is planted to peach trees; the other half is in Alfalfa; his inexpensive houses have no floors, all the droppings fall to the ground. His houses are built on runners, 6x6 scantling, and at intervals he hitches a horse or team to the house and moves it a short distance, and harrows the droppings into the soil, which is a sandy loam. In this way he gets banner crops of peaches and Alfalfa, while at the same time the trees furnish shade, and the Alfalfa green food to the fowls. In this manner he has made a great success, so much so that he rides in an auto, owns a brick business block in town, and 40 acres of a well-equipped poultry ranch, so it is reasonable to say this system is and has been a success. All the above paid for by the poultry. His house is an open front, gable roof, built very cheaply, and serves simply and inexpensively its purpose. The ideal poultry house for California is one 14x24, divided into two sections, a roosting pen and a scratching pen both open front for rainy days, with dirt floor raised high enough to avoid dampness, and with yard large enough to have something green growing in all the year around. The inquirer need not fear all the rain he gets at Santa Rosa; he should be grateful for the rain that will mature the next season's crops and his poultry will not suffer at all. Perhaps a modified house like the Tolman would suit Santa Rosa conditions; this is a house 14x24, open front and from a California viewpoint is altogether desirable.

W. H. PEARSON.

Ducks that Over-lay.

Can you tell me what I can do to stop my Pekin ducks from laying double-yolk and soft-shell eggs? They get plenty of shell and grit. I wish to use as many eggs as I can for hatching this Spring, but at this rate I shall only be able to use about half of them as one-third of them are double-yolk large eggs, about five ounces each, and then a few soft-shelled ones. H. G.

Parksville, B. C.

If you will change their feeding ration I am sure the ducks will go back to normal laying. I suspect you are either using some patented egg food which acts as a stimulant on the reproductive organs, or else feeding a large amount of too concentrated a food. If you are to use these ducks for breeding purposes in the Spring, I would recommend the following ration to be fed from now until two weeks before the hatching season: Two parts wheat middlings, one part cornmeal, one part ground oats, one-half part meat meal, fish scrap or meat scrap. Mix to a crumbly consistency, and about 10 per cent by weight each of grit and oyster shell added in the mash. Two weeks before the eggs are needed for hatching, change the former mash as follows: Two parts wheat middlings, one part ground oats, one part cornmeal, one part beef scrap, 10 per cent by weight of grit and oyster shell, and all the green food that they will consume. This green food may be steamed cut Alfalfa or clover hay, soaked beet pulp, finely chopped cabbages or beets. If the ducks are laying heavily now, it may be well to feed the first mentioned mash once a day, and equal parts of corn and wheat once a day, giving them only what they will clean up in about 10 minutes, but have the feed trough long enough so that all the birds can have access to the feed at the same time. For the present feed the second mash twice a day with green food once a day, giving the birds plenty of fresh water to drink at all times. If the food is not stimulating at the present time as I have suggested, then put the birds on a starvation ration, in other words, from one-half to one-third of what they are getting now, then bring them back gradually to laying, but be careful not to give them too much.

A. L. CLARK.

AILING ANIMALS.

Ringworm.

My calf, 10 weeks old, has a whitish eruption resembling a wart, beneath and very near one eye. A veterinarian pronounced it eczema, and ordered it treated with tincture of iodine. This has no effect and the spot is spreading. Will you recommend a remedy? G. A. M.

The disease is ringworm which is very common in calves at this time of the year. Scrub and scrape the spot perfectly free from scales and scabs and then rub in some iodine ointment. Repeat the application each other day and the trouble will soon subside. Isolate the calf as the disease is contagious. Clean up, disinfect, whitewash, perfectly ventilate and sun light the stable, as ringworm is due to a vegetable parasite (tricophyton tonsurans) which lives on damp walls and woodwork in unsanitary stables, as well as on animals. A. S. A.

Bog Spavin.

I have a horse with a bog spavin. Can you tell what will cure it? A. R. F.

New York.

A bog spavin is practically incurable, and if lameness is absent it would be better to let the part alone. In a colt under two years of age such synovial distensions of the hock joint tend to disappear without treatment, unless due to infection of the navel at birth, and to hasten disappearance we have found it well to daub the hock with pine tar now and then, and to allow the colt to run out-doors as much as possible. If tar is applied too often it will blister and remove the hair. This should be avoided. If lameness is present remove the hair and either blister repeatedly with cerate of cantharides or have the joint line-fired and blistered by a qualified veterinarian. Then give a six week's rest. A. S. A.

Staggers.

I have a very valuable horse that I bought six months ago; he had blind staggers lately and ran away. What can be done for it? P. R.

New York.

Never let the horse stand for a single day idle in the stable. If there is no work for him to do turn him out in the yard or paddock and stop feeding grain. In the stable let him occupy a roomy box stall and have the stable perfectly ventilated. Groom the horse once daily. Give the drinking water before feeding and allow free access to rock salt. Feed whole oats, wheat bran and mixed hay. In cold weather add a few ears of corn at noon. See that the collar fits properly. If the fits continue drive horse in a breast collar. A physic of one pint of raw linseed oil should be given each time the horse has an attack, but medicine other than this will not be likely to help.

A. S. A.

Stiff Joint.

What causes the hip joints of one of my cows to squeak? Sounds as if they were lacking oil. This cow is getting rather old now, but I also had a calf with the same thing which finally got so stiff it had to be killed. J. K.

Rheumatism is apt to stiffen a joint and make it give out a cracking or snapping sound during motion. This is most seen in horses and may also come from lack of exercise. In cattle tuberculosis of the bones and joints always is to be suspected in such a case as you describe, and we would therefore advise you to apply the tuberculin test. If tuberculosis is not present make the cow take lots of exercise everyday and allow her a roomy box stall in the stable. Feed roots or silage to keep the bowels active. Rub the affected joint with chloroform liniment twice daily. A. S. A.

Studebaker

WAGONS BUGGIES HARNESS

In use for 42 years —and still going

FORTY-TWO years ago Mr. Balch of Coshocton, Ohio, bought a Studebaker farm wagon. He used this wagon for twenty-two years and then turned it over to his son, L. J. Balch. In a letter to Studebaker, ordering another wagon, Mr. Balch writes:

"My father used it for 22 years and I have used it for twenty years and can say that there has never been a spoke moved in any of the wheels and it has the same boxing and spindles that were put in it when made. Tires have been changed from narrow to broad, but axles, bolsters and singletrees are those originally furnished with wagon. Last summer I hauled 6,800 pounds of weighed material in it at one load."

NOT UNUSUAL FOR A STUDEBAKER WAGON

You can buy a Studebaker wagon today that will repeat the performance of the wagon owned by Mr. Balch. We are building wagons today with the same care and of just as good material as we did when Mr. Balch bought his wagon. In fact, Studebaker wagons, because of improved methods of making, are even better today.

When you buy a wagon don't judge it by its looks alone. Stop and think what is underneath the paint.

You may be offered a wagon that looks as good as a Studebaker and the price may be less—but when you stop and figure that the cheaper wagon will probably last you five or ten years whereas a Studebaker will last a life time there is only one answer—You want a Studebaker.

Whether it is a Farm Wagon, Buggy or Harness, Studebaker's policy is "build not the cheapest but the best."

Invest your money where you get the largest returns—buy a Studebaker.

Low Factory Prices

Quaker City Mills

Free trial of ten days will convince you that Quaker City Mills grind fine and rapidly any grain, separate or mixed, ear or shelled corn, coarse or fine meal, also husks as well as cobs and corn. For 47 years we have built mills for REAL work.

23 Styles—Hand Power to 20 h. p.—All Guaranteed

Write for catalog of mills—their uses and prices; also booklet on farm machinery at bargain prices.

The A. W. Straub Co.
Dep. E 3740 Filbert St., Philadelphia, Pa.
Dep. T 3709 S. Ashland Av., Chicago, Ill.

Milne's Stump and Tree Puller

clears a two-acre circle with one sitting—pulls stumps, green trees and hedges quick and easy. **You can pull trees faster than you can cut them down,** leaving the land clear for cultivation.

All Steel Combination Stump Puller

Unbreakable—handy—rapid—powerful. The only machine on the market that can be set either stump-anchored or self-anchored. Double, Triple and Quadruple Attachments. Also Rotary Power Attachment for sawing, grinding, etc. Write for free catalogue.

MILNE MFG. CO., 860 Ninth St., Monmouth, Ill.

Grinds More Feed Per Gallon Gas

Save 25 per cent of your gasoline bill by using the fast grinding Letz. Grinds all kinds of grain, hay, seeds, screenings or snap corn, wet, dry or oily. Can't clog—force feed throughout.

Letz Self Sharpening Silent Buhr Feed Mill

Try it for ten days — if it don't grind finer, faster, cheaper than other mills send it back at our expense. Write today for details, stating H.P. of your engine.

Letz Mfg. Co., 213 East Road, Crown Point, Ind.

RUN ON KEROSENE
6c for 10 Hours

Ellis Engines develop more power on cheap lamp oil than other engines do on high-priced gasoline. Will also operate successfully on distillate, petrol, alcohol or gasoline. Only three working parts.

ELLIS ENGINES

have patent throttle giving three engines in one; force-feed oiler; automobile type muffler; ball-bearing governor adjustable while running and other exclusive features.

MAKE US PROVE IT—Every engine sent on 30 days' approval. 10-year Guarantee. Special factory prices on all sizes. Thousands of satisfied users. Write for big new 1914 catalog and special discount prices.

We Pay Freight.

Geauga County's Farm Agent.

A year ago a county agricultural society was formed here. Only one other county in the State has such an association, and that is Portage, with Mr. Miller as agent. The membership fee is $1. The county pays $1,000, the society the other thousand which is the agent's salary, and places his service at the request of any farmer in the county. Mr. Allen has given satisfaction, making a personal visit to any farm when requested, giving aid in all problems farmers are likely to encounter. He, in connection with the Portage County agent, secured fertilizers as follows for all members of the club:

Ammonia	Phos. Acid	Potash	per Ton
..	16%	..	$12.80
..	10%	2	12.80
..	10%	5	15.55
..	10%	10	20.30
1	8	3	17.30
2	8	5	18.55
2	8	5	21.30
2	8	10	25.55
3	8	6	25.30
3	24 bone	..	26.25
1	8	4	18.30
1	8	2	16.40
19	Nitrate	..	55.75
..	Potash	49	41.75

Whenever the rate is lower or higher than now corresponding change will be made in price. Shipments are in car-lots only. Every man must deposit $2 with his order as a guarantee he will take the goods and pay cash for the same, which is forfeited if he fails to remove goods and pay for them within 36 hours after notice of arrival, potash and nitrate in 200-pound sacks, all other in 167-pound sacks. Cars will deliver goods at all shipping points with a reliable man from the association to have charge of the car. It is estimated that this item alone will save the county $2,000. They also handle clover seed, Alfalfa hay, corn and other articles we need to buy. They will also send carloads of our excess crops to counties having need to buy, thus saving them all middleman's profits, which are sometimes as much as the farmer receives, by the time the produce reaches the consumer. MRS. JAMES LAMPMAN.

Ohio.

Ayrshire Breeders Convene.

With nearly 100 new members of the past year included, the Ayrshire Breeders' Association now has approximately 700 members. Of this number perhaps one-tenth met in New York on January 8 to attend to the business of the annual meeting. No papers were read nor addresses given. The president, Mr. John R. Valentine of Bryn Mawr, Pa., presented words of great encouragement to the members in view of the fact that for some time back there was little to encourage them. But a financial deficit has been wiped out and $7,500 denote the surplus of present funds. Four Ayrshire cows have added glory to the year, for they have made individual records of more than 20,000 pounds of milk each. So decidedly is the association "looking up" that it will probably send a string of 10 fine Ayrshire cows to the Panama Exposition. A committee was appointed to see about the necessary funds, and if they fail to raise the amount needed the association will invest not to exceed $2,000 in the proposition. Some changes were considered in the Advanced registry and the association expressed its desire to have Ayrshires judged at the fairs by men who breed them. The following officers were elected for 1914: President, John A. Ness, Auburn, Me.; Vice Presidents, W. T. Wells, Newington, Conn.; J. W. Clise, Seattle, Wash.; Geo. H. Converse, Woodville, N. Y.; John R. Valentine, Bryn Mawr, Pa.; secretary and treasurer, C. M. Winslow, Brandon, Vt.; auditor, Geo. H. Yeaton, Dover, N. H.; directors for three years: Chas. H. Hays, Portsmouth, N. H.; Geo. E. Pike, Gouverneur, N. Y.; C. J. Bell, Hollis, N. H.; Henry Fielden, Newton Square, Pa.; H. J. Chrisholm, Portchester, N. Y.; Mrs. F. D. Ehrhardt, West Berlin, Vt. The next annual meeting will be held in Philadelphia.

Cows $40 to $100 and more, mostly $50 to $75. Butter 35 to 40, and here the farmers sell a large part direct to the consumer. Eggs sell now for 30 to 34. They have been as high as 45 for several days. Potatoes 75; apples, retail, 10 to 30 cents per half peck. P. E. R.

Dover, Pa.

Over 1,300 carloads of produce was shipped from Barker last year, 447 cars peaches alone. Market for horses slow, selling from $100 to $250. Cows $50 to $125 for the very best; pork, dressed $8 to $9 per hundred pounds; beef $7 to $10 per hundred, dressed; cabbage $22 per ton; eggs 35; butter 28 to 30; chickens, alive, 12 cents per pound. No potatoes moving; what potatoes there are, are being held for the Spring market. Wheat and rye look very good. Logs for baskets are sold to the factories for $20 per thousand. Hay is slow at $10 to $12 per ton. M. H. L.

Barker, N. Y.

Adds 25% to 50% to your building's value

THAT'S the **investment value** of good paint on the average building under average conditions. So why let your buildings depreciate when you can not only stop the depreciation but increase their value? Good paint—such as Lucas paint—is a sound investment that pays **real** dividends. Conservative selection of paint—like you select all your investments—leads you instantly to

Lucas Paint

The scientifically ground, expertly mixed paint that has a quality reputation since 1849. In those 65 years the Lucas skill, brains and facilities have developed the highest paint standard. Every batch prepared must meet this standard before it bears the Lucas label.

Farm Management.

UNLOADING HAY BY HORSE POWER.

I have a barn in which are two mows with a floor or driveway between them. I grow from 20 to 30 tons hay, mostly clover, in a season. Prime or best hay is put in one mow and anything inferior in the other, such as is weedy or damaged by rain, etc. I would like to have advice from some of your readers on the easiest and cheapest plan to get the hay into these mows. From floor on which wagon stands to the ridge pole or highest part of roof the distance is about 33 feet, and difficult to reach when barn is empty, therefore I intend putting in necessary machinery during this Winter when mows are full. Answers to the following questions would, I think, give me much information on the matter: Presuming that a carrier be used is a steel track preferable to the wooden? Will a reversible carrier drop hay in either mow as desired? How much time will be consumed in changing from one mow to the other? Can the change be made without going up to track? What is the best kind of fork for use in clover hay? Double harpoon is not satisfactory in my experience. Last season I used two single harpoon forks chained together, with better results. Is the sling more satisfactory? Could it be used on hay rick 18 feet in length? In case rick is too long for one sling, could not two shorter ones be used? Can grain in sheaf, corn fodder, etc., be successfully handled with sling? Could not gasoline engine be used instead of horse power in handling hay? If so what machinery would be necessary? J. F. T.

Pennsylvania.

R. N.-Y.—We want the experience of practical farmers on this. In our own barn we use a steel track and find it very satisfactory. A reversible carrier takes the hay to either side. It requires about 20 minutes to change from one to another, and it is necessary to go up to the track. We use a double harpoon, but would like a better fork. We have had no experience with slings and would like to hear from farmers who have used them. Several cases are reported where gasoline engines are used to hoist the hay. In these cases the hay fork ropes run on the drum of a windlass, which is run by the engine, and under control of a lever.

CO-OPERATION IN MANAGEMENT.

The much talked of question of farm labor and the hired man was satisfactorily settled by one farmer, by making the man in a certain sense a partner in the business, with a personal interest in the profits from the farm. They carried it out in this manner. The man had been on the place one year and proved very trustworthy and conscientious. When it came time for a bargain for the second year the owner offered an advance in the regular wage, which would have amounted to $40 in the year, or a bonus at the end of the year of 10% of the profits. The man accepted the latter plan, and it has worked out to the advantage of the owner and also to the advantage of the man. The only question was what was to be considered expense and what credit on the ledger. They worked out the following plan:

Everything sold off the place was a credit. Then on the expense account, first came all wages for labor (here your man sees you get your full work from any extra labor hired). Second, all feed that was not grown on the place. Third, all repairs of tools, horseshoeing, doctoring and incidentals to the daily running of the farm. Fourth, all stock which will be sold that same year. Fifth, purchased stock such as horses or cows that will remain on the farm and all implements which will last more than the one year, were charged at one tenth or one-fifth of cost, this amount being obtained by estimating the probable life of the animal or tool. There was no credit taken by the stuff eaten by the owner's family, nor any interest charged on the investment in the place, nor any charge made for the owner's own labor, and if some animal was sold at an advance price, the profit was credited. The whole plan is one that must be worked out to fit each and every place, but in this case it has worked not only to the benefit of the owner and of the man, but to the happiness and contentment of both.

If the man saves money for the owner, if by working a little harder or longer he can save the extra help on some special piece of work, or by extra care and foresight his tools last longer, it means money in his pocket, and anyone gets tired working for the other fellow, and enthusiasm lags. But if we are working, not only knowing that the work is going to be appreciated, but that we are going to receive a substantial reward for our effort, any man will work harder and longer and see no inducement to move to another place. As one man aptly put it, "It is more fun." S. R.

Utilizing Peat Spots.

In answer to J. F. McC., page 1375, I would say that I have had the same experience with a peat moss swamp, and have worked for years to solve the same problem, which I at last accomplished. This can be accomplished, after well draining, by putting on good manure. But to lessen expense, I found that by drawing on gravel, two loads to the square rod and some manure with it, I obtained the same results. The best crops to raise first on this reclaimed land are onions and potatoes. Later it will raise nearly any crop when well subdued and enriched. The only enrichment necessary after well subduing is commercial fertilizer but this will not do on the start. I have raised onions on the same ground for years in succession with only commercial fertilizer to enrich it.

If a quick method of seeding is desired, the land can be first plowed, then burned, the fire going only the depth of the furrow. Then sow Timothy seed and manure in the ashes and a good seeding is obtained. This will make the land somewhat lower and is not advisable if the other method can be executed. I have also a plot of swamp where I have cut (with a specially made shovel) dried in the sun and ground peat moss for horse bedding. I have sold hundreds of dollars worth at $10 a ton. The hole left by this also helps to drain the swamp. I consider my swamp ground as very valuable to me hope J. F. McC. will be as successful. H. E. P.

Broome Co., N. Y.

R. N.-Y.—A bulletin from the Vermont Experiment Station pictures a spade used for this purpose and tells how to dry the chunks of peat. Slaked lime helps such peat soils by breaking them up and starting ferments. They always need potash and phosphoric acid as fertilizers. It is good farm management to make use of these low and peaty spots for manure or bedding.

Piping Water to a Well.

Concerning the combined well and cistern on page 1342, I have three wells on my farm that were dug and stoned up many years ago. One is at the house, one at the barn and one half way between. They all come to rock at 10 feet and each one is pecked two feet in the rock, so each well is 12 feet deep. They all have an abundance of water, until we have had a long dry time; then they will go dry and stay dry long after we have had heavy rains. I turned the water from the eaves trough of the barn into the well there, and had plenty of water for my four horses ever since, though the other wells gave out long ago. Late in the Fall I had one of the other wells drilled 15 feet lower, and got an abundance of water, but the well that has not had anything done to it is still dry, so it may help some to turn the water into the well in spite of what your umpire thinks of it. M. F.

On page 1342 "Umpire" seems to be up a stump, as to the policy of putting surplus water into his well that has nearly run dry. About 1870 I dug a well in my barnyard for my stock; it went down about 20 feet through blue clay, then we struck a layer of sand and gravel, but no water came up into the well; then we dug about six feet further which filled promptly. The well was 10 feet across at the bottom, this was stoned up, but the well could not be depended upon in a dry time. Then we put eaves troughs onto the barn and ran them into the well, and it never absolutely failed after, although it was not sufficient for my full stock of cattle, 30 head. I should by all means try the extra water.

UMPIRE NO. II.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

Pure Milk Means Concrete Dairy Buildings

Every dairyman who intends to stay in business is rapidly replacing his old wooden buildings with modern structures of concrete.

Health regulations are very strict; unsanitary cow barns and milk houses are no longer tolerated. To furnish certified milk it is necessary to have floors and platforms of non-absorbent material, gutters of cement only, inside wall surfaces smooth, tight and water shedding, floors clean and water tight. There is a way to fulfill all these requirements—build of concrete. Specify

UNIVERSAL PORTLAND CEMENT

for such work. Its fine, even quality and regular setting properties insure strong, enduring concrete. Our free, 160 page book "Small Farm Buildings of Concrete" will be sent you upon request.

FROM A VETERAN JERSEY BREEDER.

Your correspondent on page 1373 gives good advice, but I would advise local cow-testing associations such as Vermont has in both purebred and grade communities. Recently I talked to some Jersey breeders at Alliance, Ohio, who are organizing and found there a number of wide-awake farmers who are interested. The point I advise is, do not run your cows dry for months, heavy fed before calving, then force for every drop and call or believe it an advanced registry or register of merit test *honestly* made. It is a "make believe" to fool yourself or others. This may be considered a fool's advice; if you do not agree with me, read the remarks made at the dinner of one of the great cattle clubs, at the last Chicago Dairy Show, 1913. One of our good breeders said: "I am satisfied that the carrying of cows a period of 12 months in their tests is not in the best interests of the cow or her owner, it is a violation of a natural law, and we cannot violate Nature's laws without suffering for so doing. I think everyone will agree with me when I say many cows have been practically lost or ruined during these tests; and besides, we are misleading the man who is simply a general farmer, because it is misleading to hold up a tremendous record, which he would like to live up to but *cannot possibly* make. I would like to know how many men there are here today, if they told us what really occurred in their experience would tell us they have crowded through this long period, crowded to the extreme limit in order to make a great record." Another asked, "How many dare publish their cash accounts for tests?" He said: "Through the 'Breeders' Gazette' I have challenged my colleagues to render a statement. Our dairy cattle breeders, and I do not specify or except any breed, are publishing records that are fabulous, and can we believe them?"

My advice to the Alliance breeders was: "Get THE R. N.-Y. and Hoard's Dairyman." R. F. SHANNON.

Pennsylvania.

AILING ANIMALS.

Worms.

For the past three years I have fed my horses cornstalks during the Winter, with plenty of root vegetables such as potatoes and carrots, but I notice each year that they are bothered with intestinal worms. One of my neighbors told me to mix hard wood ashes with salt equal parts and keep this constantly before them. Are the ashes harmful? If so what are the effects upon the horse, as they will lick twice as much of this mixture as they will of salt alone? C. F. L.

It appears that corn fodder, like swale hay, tends to infest horses with worms. At any rate many farmers assure us that is the fact. It might be better to feed the horses mixed clover and Timothy hay, instead of corn fodder. Horses should have access to rock salt at all times; but there is no need of feeding wood ashes right along. The ashes supply alkaline matters, such as potash salts and lime salts, and may prove somewhat constipating. They are not especially hurtful. For worms give a tablespoonful night and morning of a mixture of equal parts of sulphur, dried sulphate of iron and salt. Continue for a week, then skip 10 days and repeat. Omit the iron for a mare in foal. A. S. A.

Indigestion.

I have a mare five years old; she keeps moving in stall most of the time, puts her front feet forward one at a time, bumping the manger, stands with her hind legs wide apart. When she works she is limber as a colt. She is thin, cannot get much flesh on her. When she stands in barn sweats easily; will be all wet if she is working or driving. F. H.

Reduce the grain ration one-half and feed not over one pound of hay per hundred pounds of body weight as a day's ration. Never let her stand for a single day idle in the stable. Allow her a roomy box stall in the stable. Clip the hair from her belly and from the legs above knees and hocks, and that will soon stop sweating in the stable, provided the stable is perfectly ventilated. The feed may be gradually increased in amount as soon as she is doing well. The trembling and position taken at some times indicates the presence of chorea (St. Vitus' dance), and that is incurable. A. S. A.

Eczema.

I have a mare, about 1,300, clean, clever and a handsome one; works well and eats well, but every so often—generally once a month or so, sometimes twice a month and sometimes once in two months—she has a water blister, sometimes on her neck, side and hind quarters. If treated immediately with hot applications the discharge flows slowly, and in time the skin peels off, not affecting the hair. If she gets to rubbing it before I can do anything for it she rubs all the hair off and the skin looks bloodshot, discharges foul-smelling water. The hair in time all grows out again the natural color, and she is all right again. Some say it is mallenders; if so, what can I do to stop it; also what is the proper cure for lampas in a horse? Her upper gums at the roof of her month have swollen and dropped almost even with the bottom of the teeth, and she continually chops and rubs her tail to pieces. M. A. C.

Massachusetts.

Mallenders is an eczematous disease affecting the back of the knee, and the corresponding disease known as sallenders affects in the same way the skin in front of the hocks. The condition you describe apparently is eczema, and it seems evident that indigestion is the cause, seeing that the mare rubs her tail and also has "lampas" or "lampers." The latter condition is not a disease, but merely a swollen state of the bars of the hard palate, just back of the upper incisor teeth. It generally is sympathetic and associated with like swelling of the entire buccal membrane and gums of the mouth. The cause is cutting of teeth, or irregularities of the teeth. These too commonly cause indigestion. Have the teeth attended to by a qualified veterinarian and at the same time clip the hair from her belly and from the legs above knees and hocks. The clipping alone often greatly benefits indigestion. Never let her stand for a single day idle in the stable. If there is no work for her to do, turn her out and cut the rations down materially. Allow her a box stall when in the stable, and to prevent tail rubbing put a wide plank on brackets around the inside of the box, shelfwise, just high enough to prevent tail rubbing. Treat tail by scrubbing clean, and when dry pour on and rub in a little mixture of equal parts of kerosene and machine oil. Repeat three days in succession, then apply every three days a creamy mixture of sulphur and sweet oil. Internally give half an ounce of Fowler's solution of arsenic night and morning until a quart has been given; then gradually discontinue the medicine, taking at least a week to the work. Feed whole oats, wheat bran, mixed clover, hay and carrots. If a sore is seen to be coming upon the body paint it daily with tincture of iodine, after removing the hair, and open it when soft; then swab daily with the iodine tincture until well. A. S. A.

Strained Tendons.

I purchased a stallion April 4, 1913. I owned him about two months when he went lame, seems to have a thoroughpin. I sent him to a hospital (at this time he was up on his toe) to be treated. They blistered his hock but seemed to do little good. He came down on his foot flat, although an ordinary drive of about eight or 10 miles will put him back on his toe for a day or two. I have done nothing for him lately. He gets neither better nor worse. He is about ten years old. I keep him in a box stall where he gets exercise. E. F. M.

Maryland.

The symptoms suggest strained tendons rather than thoroughpin and it would be well to have the veterinarian line-fire the back tendons and then blister them, after which the horse should rest for six weeks. If you do not care to have the horse fired, blister the tendons repeatedly with cerate of cantharides, applied at intervals of three or four weeks. Clip off the hair and brush the skin clean; then rub the blister in, a little at a time, for fifteen minutes, wash the blister off in two days and then apply a little lard daily. A. S. A.

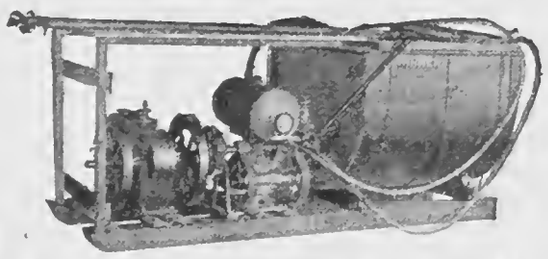
Malanotic Tumor; Garget.

1. I have a gray mare with a growth of some kind on her cheek about where the throatlatch buckle comes. It is soft, black, about the size of a hickory nut and seems to contain considerable blood, and bleeds a little at times. What is it and how may it be removed? 2. I have a registered Guernsey cow that has garget in two diagonal quarters of her udder. She is naturally a heavy milker, and is due to freshen in March. What care should be taken to avoid trouble at that time? Would it be safer to milk her right up to freshening time? J. M.

Allegany Co., N. Y.

1. The growth is a malanotic or pigment tumor and it is malignant and incurable. Such cancers are peculiar to grey or white horses when they are aging, and generally come on the black skin under the tail and about the anus and vulva. They usually return when excised. Have that done, however, and then apply tincture of iodine each other day if you see that the growth is coming back. It is best not to breed from an affected mare. 2. Milk the cow right along; indeed it would be best to milk the affected quarters three times a day. At night rub in a mixture of equal parts of fluid extract of poke root and druggist's soap liniment. If pus forms in the affected quarters when the calf is born, or before and soon after calving, the quarters will be permanently ruined for milk production, and the best treatment then is to cut off the ends of the teats or split them open to allow the pus free vent; then feed off for the butcher. A. S. A.

REAL SPRAYING
Means More and Better Crops



The Winner Spraying Outfit

Shown above is high-class from start to finish. To spray successfully you want high, continuous pressure, and the Winner supplies it; is complete with 100-gallon tank, 1½ h.p. high-class engine and pump, suction hose, 50-feet discharge hose, 4 nozzles, rotary agitator, etc. A complete outfit ready for work at $150. Send for description of this and other spraying outfits; also **Gasoline Engines for any kind of work on the farm**. Tell us size farm you own and get special proposition.

R. Consolidated Gasoline Engine Co.
202 Fulton Street, New York City

The BALL SEED AND PLANT FORCER
A NEW METHOD IN MODERN HORTICULTURE.

Patent Applied For.

This is just what you have been looking for. Can start out-door gardening weeks ahead of usual time. Cheap enough to use them by the thousands. A complete individual glass-covered plant frame, like cut, as low as 2½ cents each. Will make your sugar corn, lima beans, melons, cucumbers, lettuce, and all vegetables and flowers two to four weeks earlier than by any other method. Beautifully illustrated book FREE, showing the marvelous results that are yours by using our methods. Let me tell you more about this and many other wonderful new money-making inventions for the garden. Only to be had from
THE BALL MFG. COMPANY, Dept. K, GLENSIDE, PENNA.

SPRAYER for Gardens, Estates, Parks, etc.

20 gallon, one man outfit, mounted, 100 lbs. pressure. Brass pump, easily taken out of the barrel. No corrosion. Ball valves, wick packing, easily got at. One of 70

IRON AGE Bucket, Knapsack, Barrel, Power and Traction Sprayers.

Can be used as a bucket pump.

Something suitable for each man—from poultry house and small garden, or a few home bushes, to the big orchard and field crops. Unit Sprayers that can be built up to your growing needs. Ask your dealer to show them and get our new "Spray" book, spray information and Iron Age Farm and Garden News.

"Friend" Sprayers Make Good
and THERE'S A REASON

SPRAY

Please send the following repairs for our sprayer: . . .
We wish to say just here that the "FRIEND" sprayer has given us perfect satisfaction. We have 14,000 peach trees that we sprayed three times last season and did not ever have one minute's loss of time, or trouble, on account of the machine. We have the New Western Queen type and find it to be exactly what we want, as we can go anywhere in our orchard with it and it never gives any trouble.
CREST MOUNTAIN FRUIT FARM,
CARL L. PASLEY, Prop.
THOMASTON, GA., Dec. 16, 1913.

Our Western outfit gave good service last season and it looks as if it would last for many years to come; we have just rigged it up for work next week and it is in apple-pie order. I feel well disposed toward a machine that made a profit of $2,000 for us in one season, and we expect our machine to earn another $2,000 for us within the next thirty days. FRANK T. SWETT.
MARTINEZ, CALIF.

Our catalog shows sprayers, large and small, varied prices and complete line best fittings. A new Nozzle, a new Shutoff, a new Bamboo and a new Safety Valve for any make of sprayer, etc., etc. Want it?
"FRIEND" MFG. CO., Gasport, N. Y.

The Silent Milker

The 1914 HINMAN is absolutely noiseless and even simpler—more efficient—and easier to operate and clean.

Each Hinman Milker works separately. Each is complete within itself. Requires very little power to operate. Allows a record to be kept of each cow.

The HINMAN
A Milker That Meets Every Demand

More than 50,000 cows are milked daily with the HINMAN. These dairies are scattered all over the United States. All kinds of cows—all conditions—all classes of dairymen—all a success. The machine for 10 cow dairy.

Following are a few more features found only in the Hinman? No vacuum in pail; quick pail-changing system, visible milk flow; no piping—just a simple drive rod; only two moving parts.

THE HINMAN BOOKLET, 32 pages, illustrated in colors, is really treatise on how to select the best milker. Copy for the asking.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Lightening a Heavy Concentrate.

On page 1310 R. B. advises L. E. S. to feed a combination of ground corn and rye and cottonseed meal. This makes a very heavy concentrate, and unless fed with the silage will not be as satisfactory as its feeding value would warrant. R. B. would better mix the feed with the silage. J. D. P.

Ohio.

Dairy Ration.

Will you give me a grain ration for cows? I have cornstalks, mixed hay and ground oats. Can buy gluten feed at $32 per ton; cottonseed $36; wheat bran $29; brewers' grains $32; wheat middlings $32; buckwheat middlings $25.

Phelps, N. Y. C. W.

A mixture of three parts by weight of ground oats and two of each cottonseed meal and buckwheat mdidlings will be very good for milk production. Feed one pound of grain for three to four pounds of milk. For two or three weeks after the cows freshen, and for several weeks before, it will be better not to feed cottonseed meal, but give instead equal parts of ground oats, bran and buckwheat middlings. C. L. M.

Cut Hay for Horses and Cows.

I am feeding my horses cut feed (hay cut fine and feed mixed with it wet). I find it takes only two-thirds to keep them in better condition than when fed separate. I have a power cutter and plenty of time until Spring. Would the same process of feeding apply to milch cows with profit, or would it be injurious? C. S. F.

Lowell, Mass.

There will be no harm whatever in cutting the hay for cows, moistening and mixing with grain. Probably the results will be a little better, but whether enough better to pay for the trouble is a matter for you to decide. Cornstalks would undoubtedly be much more valuable treated as you say, than when fed whole.

C. L. M.

Thin Heifer.

I have a heifer that will be two years old in February next. She is due to freshen about February 5. She was in fine condition all Summer while out in pasture, but since putting her in the barn she seems to be getting somewhat thin. Will you tell me what you would advise feeding her? I can get all kinds of grain and feed here; have plenty of good Timothy hay. J. P.

Lanesboro, Pa.

In a case like this I know of nothing better than equal parts by weight of ground oats, wheat, bran and oil meal. Feed four or five pounds daily, according to the size of the heifer, in addition to what hay she wants. It is a very common mistake to let cattle grow thin during the Fall, and after bringing in from pasture. There seems to be a common impression that while a cow is giving milk, especially when fresh, she needs considerable grain, but when "dry," a little rough fodder is sufficient. During the last few weeks before parturition the calf is growing very rapidly, and the cow must furnish the material, even at the expense of her own flesh. Then too, the cow should have a good reserve of strength for the ordeal of maternity. Furthermore, if a cow is not accustomed to eating grain before calving, her digestive system is apt to be upset by heavy feeding afterward, and she is especially liable to attack of garget or indigestion. The time to feed for milk is before freshening, just as much as after. A cow that is in good condition and strong will give birth to a good lively calf, and come through the ordeal in fine shape to do her best at milk production. The way to secure this condition is by liberal feeding, with plenty of protein in the ration, and by giving a reasonable amount of exercise. A cow seems to store up capacity for milk-giving by liberal feeding before becoming fresh, just as the athlete stores up strength by weeks of exercise and practice. I cannot emphasize this point too much. Be liberal with the dry cow and she will repay you for it. Avoid cornmeal or cottonseed meal, but ground oats, bran and oil meal are excellent. C. L. M.

Balanced Rations.

Will you give me a balanced ration with the following grains? Gluten $30.50 a ton; beet pulp $28; bran $26; oil meal (old process) $2 a hundred, $40 a ton. I also have corn on the ear which sells at 75 cents a bushel. Grinding will cost me about nine cents a bushel, making corn 84 cents a bushel. This may be too high for a cheap balanced ration. For roughage I have corn fodder and some Timothy and meadow hay, mostly Blue grass.

Trexlers, Pa. W. K. T.

It is my opinion that it will pay you better to sell your corn and buy other concentrates. In that case a good combination would be gluten feed, two pounds, bran three pounds, and oil meal two pounds. If you prefer to have the corn ground, the following will be good. Cornmeal two pounds, bran two pounds, and oil meal three pounds. Feed five or six pounds to a cow, giving 20 pounds daily, and more or less in proportion to the amount of milk given. As you have no succulent feed it will probably pay to give one pound of beet pulp, once a day, moistened and mixed with the grain. C. L. M.

Ration for Jerseys.

Will you balance me a ration for my Jerseys weighing probably 850 or 900 pounds, giving 25 or 30 pounds milk per day? I have for roughage silage and mixed hay; following feeds available: Gluten $30 per ton, wheat feed $30, hominy $30, ground oats $30, bran $24, brewers' grains $29, cotton-seed $34, ground corn $32, which I do not care to use very much, molasses feeds $26.

Hamden, N. Y. W. L. T.

I have worked out the following ration as meeting the requirements:

			Dry Matter	Protein	Total Nutrient
Mixed hay,	10	pounds	8.710	.580	5.050
Silage,	35	"	7.920	.420	5.160
Cotton-seed meal,	3	"	2.790	1.128	2.418
Brewers' grs	2	"	1.826	.400	1.314
Ground oats	2	"	1.792	.176	1.350
Total			23.038	2.704	15,292

Nutritive ratio, 1:4.7.

If your milk tests much above four per cent butterfat, probably the grain ration should be increased somewhat, say to eight pounds per 25-pound cow, keeping the proportion the same. C. L. M.

Dairy Ration.

Can you suggest a balanced ration from the following: Wheat bran, $24.50; shorts, $26.50; linseed meal, $42; clover and Timothy hay, $15. In view of above prices what could I afford to pay for dried brewers' grain, or malt sprouts? I am not posted on the malt sprouts as to price. As I figure it the linseed meal furnishes the cheapest protein, wheat shorts next and bran the dearest of the three items. Cow is giving 16 pounds milk a day, seven pounds butter to the 100 pounds milk, old style of skimming and dash churn. She will weigh 1000 pounds, due to freshen Jan. 17. S. S. S.

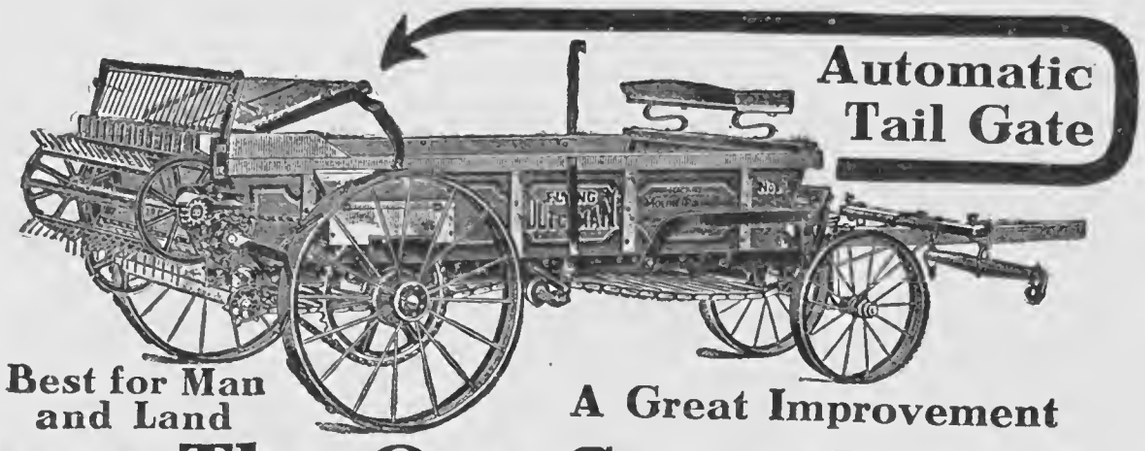
A sufficient ration for the above cow would be 20 to 25 pounds of mixed hay one pound wheat bran, two pounds wheat shorts and two pounds linseed oil meal. Or, if you wish to use brewers' dried grains or malt sprouts, two pounds malt sprouts, shorts and one pound oil meal. When the cow freshens the grain ration should be increased to one pound of grain to about three of milk. You have figured correctly as to the relative values of the several feeds, from the standpoint of protein. If you can obtain the brewers' grains for $1.60 to $1.75 per cwt., it will be cheaper than bran as far as protein is concerned. The shorts and oil meal need something coarse and bulky, like bran, brewers' grains or malt sprouts to lighten them up. The vlaue of the sprouts and brewers' grains is practically the same. C. L. M.

Trouble With Butter.

I have been making butter from a Jersey cow's milk and had no trouble with it coming till a few weeks ago. We have been giving her cottonseed meal with her other feed; since then I cannot get the butter to come. Do you think the feed has anything to do with it? Her milk is curdled and stringy. I would like to know what to do for it? C. G.

Boylston, Mass.

Cows that have been milking for a long time, and are due to freshen again in a few months, especially when on Winter feed, are quite apt to give "stringy" milk. If your cow is due to calve in two or three months, or less, you had better stop feeding cottonseed meal and dry her off at once. If she is not due to calve for four or five months, or longer, cut out the cottonseed meal for a time and feed more laxative foods, such as silage, roots and bran. When her milk becomes normal a small amount of cottonseed meal, from one to two pounds per day, fed with bran and other laxative foods, will help in the production of milk by supplying a cheap source of protein. Cream from "stringy" milk is very hard to churn. C. S. M.



The One Spreader Saves Strength of Manure

It is a well known fact that thin or liquid manure has the greatest fertilizing value—it is much more valuable to land than dry or rotten manure. The wetter it is, the better; every load of it is worth gold dollars to the farmer as soon as it is spread on his land.

There are many manure spreaders on the market today but they are so constructed that practically all of this valuable thin manure is wasted before it reaches the field.

The Flying Dutchman Spreader
NO. 14 NEW ENGLAND TYPE

is so constructed that it **saves** this material and enables the farmer to spread it just where he wants it.

It is a Low Down, Easy to Load, Endless Apron Spreader built with a **level** body and an **Automatic Tail Board** which prevent the thin manure from running out behind and wasting.

Load your spreader right from your barn, spread it while it is fresh and has its full liquid strength.

This spreader is unusually light draft, the rear wheels are **under the load** insuring perfect traction. It has steel frame, steel wheels, steel beater and the apron runs on three sets of hardened steel rollers.

It is very simple in construction—simple to operate—one lever does everything. A small boy can easily handle it.

Let us send our **Free Folder** and our 1914 Almanac. Write today.

Ask any **Flying Dutchman** Dealer about the **Flying Dutchman Spreader No. 14.**

PRODUCTS, PRICES AND TRADE.

During 1913 the United States Steel Corporation turned out 16,800,000 tons of steel ingots, 14,000,000 tons of pig iron and 12,000,000 tons of rolled products.

Shipments of grain from Baltimore were unusually heavy the past year, 48,599,649 bushels, 15,000,000 more than the the previous year.

The potato market is in a very uncertain condition, dealers being inclined to hold for higher prices on the probability of considerable damage by frost to shipments now on the way.

The gold output in the Rand, South Africa, was 8,794,824 fine ounces, a decrease of 329,465 over the previous year. Its value was about $185,000,000.

The milk surplus has been somewhat reduced by the holding back of supplies by shippers with facilities for butter-making, but there is still considerable talk of a one-fourth cent reduction the last of this month. Gross prices of $1.81 to $1.91 for B and $1.61 to $1.71 for C cover a large part of the business.

Movements of corn from Argentina to this country are growing rapidly. Since October nearly 8,000,000 bushels have arrived at New York. Seven steamers are now on the way, bringing 42,000 tons, and six more are unloading here. In large lots this corn is bringing 70 cents at New York, underselling shipments from the West two cents per bushel.

A project is under way for building a concrete road from Fond du Lac to Green Bay, Wisconsin. The distance is 70 miles and the estimated cost $1,000,000. The method aimed at is to get at least 50,000 people along the Fox River valley as members of the road association.

A further decline of two to three cents per pound on butter is noted. There are very few sales of choice creamery above 33½ cents, 30 to 33 cents covering a large volume of the business. Trade in storage creamery is quiet, holders being unwilling to make a reduction proportionate to that on fresh stock. The drop in State dairy and factory is slight, as prices have held at a comparatively low level.

Eggs of the better grades advanced slightly during the week, but there is a general feeling that a lower level will soon be reached, and buyers are stocking up as lightly as consistent with current needs. There are few sales of whites above 40 cents, 35 to 38 covers most of the business in good to prime grades. Storage eggs of the better grades go mostly at 29 to 31 cents.

Along the Atlantic coast there are about 40 fish scrap factories, the greatest number being in the Chesapeake Bay region. The fish chiefly used is menhaden, nearly 900,000,000 being worked up into oil and fertilizer material annually. This is the oldest fertilizer industry in this country, as the Indians in Connecticut used the fish in their corn culture.

The H. B. Claflin Co., the largest dry goods concern of its class, reports net earnings for the year of $262,254.02, which gives a dividend of six per cent. on the common stock. The largest dividend on this stock since the company's organization was nine per cent., in 1893. Some of the assets are: Merchandise, $5,821,748.52; store property, $2,739,181.58; stables, wagons, autos, horses, etc., $96,884.73. The total capital stock is $9,000,000.

During the two zero days of the past week very little business was done in apples and tender vegetables. The water front on both the New York and Jersey sides is a cold spot, and the combination of low temperature and high wind made it necessary to cart freezable produce to the store or warehouse as soon as unloaded. Apple prices remain unchanged from last week, $3 to $4.50 covering most sales.

The outlook in the raw wool market is improving, and there is some prospect of slightly higher prices. Manufacturers are finding a better outlet for their goods and hence are more interested in the raw material. Recent sales in Boston, which is the great wool market of this country, have shown the following prices: Fine staple, greasy, 18 to 18½; half blood, 19 to 19½; Montana and Utah greasy, fine and medium, 16 to 17; Western, scoured, clothing grades, 45 to 47; New Zealand, crossbred, greasy, 24 to 28. Australian markets on the higher grades show an advance of about two per cent.

—"And I suppose, like a brave soldier you followed your colors?" "Yes; whenever there was a battle I noticed that the colors were flying, so I fled, too."—Buffalo Express.

A teacher had lessons to an infants' class on the Ten Commandments. "Can any little child give me a commandment with only four words in it?" she asked. A hand was raised immediately. "Well," said the teacher. "Keep off the grass," was the reply.—Credit Lost.

Don't Feed the Soil — Feed the Plant

In the top eight inches of average soil there is enough plant food in the form of nitrogen to last for 90 years, in phosphoric acid for 500 years and in potash for 1000 years.

And yet that very spot may prove barren. Plants have to take up their food in solution, in the "sap of the soil." All this food may be locked up so tightly by nature that the plants can't get at it fast enough for the commercial farmer, and he has to put in the same food in the soluble form of fertilizer.

Just so, a fertilizer may, by analysis, have all the necestary elements and yet not give the plant full value because these elements are not ready soluble.

Put into your ground a fertilizer that will feed not your already overstocked soil but your hungry *crops* with food which is available and easily absorbed.

Bowker's Fertilizers

have chemically correct elements—there is a brand to fit every need. More than that, these chemicals are blended and mixed so that they are rendered water-soluble and go into your ground in the most available form. Most crops do most of their feeding in 60 days.

Write for our illustrated catalogue, based on forty years of experience. In writing, state what your crops are.

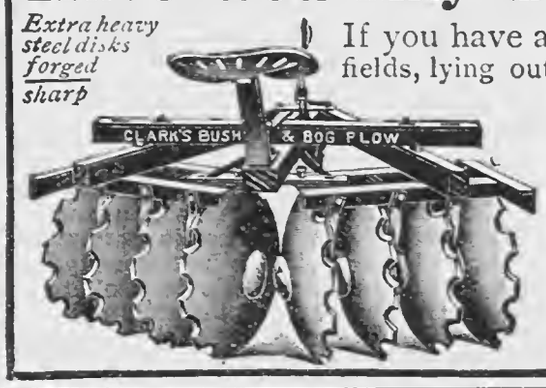
Have You Any Bush or Bog Land?

Extra heavy steel disks forged sharp



If you have any bush or bog fields, or parts of fields, lying out as waste land, or if you have any tough sod that you want to thoroughly chop up, or if you have any other disking that heretofore you considered impossible, put the *Cutaway* CLARK'S on the job. You will be astonished at what this big, strong, heavy plow or disk will do to it. Let us tell you more about this tool. Write today for catalog and B. & B. circular.

BUSH AND BOG PLOW

CUTAWAY HARROW CO., 839 Main St., Higganum, Conn.
Makers of the original CLARK double action harrows

Fills Your Silo Quickly With Less Power and Labor

You can operate this machine with a 4 h. p. gasoline engine. It's the lightest running blower type of ensilage cutter made—The *throwing, blowing, lifting force* carries the ensilage in a steady full stream rapidly up into the highest silo without waste of power. The ensilage packs perfectly and keeps sweet and succulent. The

PAPEC ENSILAGE CUTTER

is easy to set up and take down. Simple in construction, not easy to get out of order. The entire frame is one solid piece of semi-steel. The bearings are always in line, run smoothly and will not heat. The feeding mechanism is geared to the main shaft—always gives you the desired length of cut. The *Papec Ensilage Cutter* is not chain driven, but has heavy gears which transmit *all* the power. It cuts ensilage perfectly and swiftly—as fast as you can bring the corn to the machine.

Write for Illustrated Catalog. Send today for this book. It shows how The "Wonderful Papec" cuts ensilage with less power, time and labor.

Chicken Figures Once More.

On page 25 you have an article, entitled "A Chicken Man's Arithmetic," which proves to me that you can prove anything with figures if you do not think too deeply. If B. H. C.'s figures were correct, there would be no breed in existence except the White Leghorn; but anyone who knows anything about poultry knows that it is pure theory, and not very good theory at that. If you want to prove this, simply put some heavy breed in with a pen of Leghorns, and you will find that though the Leghorn is more active, and so gets more than its share of the food, the heavier breed will soon be over-fat. I will take a pen of chicks of some of the heavier breeds, and the food that is used for an equal number of Leghorn chicks, and in 10 weeks I will develop them to three-quarters of a pound apiece more than the Leghorn.

Then in the case of the adult bird I will produce eggs on less food per egg than he can with Leghorns simply because of the Leghorns' food going to make muscle and sinew. His figuring is somewhat like the figures often used for heavy-laying hens: If a hen lays an egg a day for a week, and there are 52 weeks in the year, by jinks! that is a 365-egg hen. Tommy-rot! This is the kind of figuring that leads so many people into the chicken business, and through the chicken business to failure and disgust. Let us get away from such extravagant theories and we shall be on the road to business stability. J. F. C.

New Jersey.

Feed and Care of Winter Layers.

The following is the regular routine of work as practiced on a successful poultry farm: Their laying stock was mostly early-hatched S. C. White Leghorn pullets of a good-laying strain. Not only were they early hatched, but they were raised on free range and under natural conditions. They were kept growing every day in the year, so by the time they were put into Winter quarters they were fully matured.

The first thing in the morning was to raise the muslin curtains, unless the weather was exceptionally severe, or the wind, accompanied by rain, was blowing from the south. In that case they are left closed. They next fed each pen a scanty feeding of a mixture of equal parts of corn and wheat. This grain mixture they scattered well over the litter, and with the aid of a fork work it well down into the same. Next they replenish the drinking dishes with clean, fresh water, with the chill taken off. Then the roost platforms were cleaned and a little sand sprinkled on the same to facilitate cleaning the next day. The grit and oyster-shell hoppers were next inspected to make sure they were in working order. At about 10 o'clock the attendant fed a supply of Alfalfa hay, about an armful to a pen of 100 fowls. The eggs were also gathered at this time.

At noon the eggs were gathered, a supply of greed food, either cabbage or mangels, enough to last them until four o'clock, fed; the drinking dishes refilled, the dry mash hoppers opened, and a little green cut bone—about one ounce per fowl—fed. The dry mash hopper contains the following mixture: 100 pounds middlings, 50 pounds bran, 100 pounds cornmeal, 10 pounds oil meal, and 75 pounds beef scrap. At two o'clock the eggs are gathered again to prevent getting chilled and dirtied. At four o'clock the eggs are gathered again, the dry mash hoppers closed, a feeding of a grain mixture of equal parts of corn and wheat is fed. This feeding of grains is very liberal, so all get a chance to fill up and leave a little over for the next morning. The muslin curtains and all open windows are closed at this time excepting on very warm nights. Just before locking up at night the drinking dishes were emptied to prevent freezing. They renewed the litter often enough to keep it loose and dry. Each pen was equipped with a dust box, with the following dusting mixture: equal parts of road dust and fine sand.

Ithaca, N. Y. F. W. KAZMEIER.

Poor Laying.

Can you tell me why my hens and pullets do not lay better? They seem perfectly healthy, have practically unlimited range, have a dry mash—I think the Cornell formula, scratch feed at noon in litter, and corn on the cob at night; seem to be in good condition, neither fat nor thin, and not ragged. They have green feed, shells, of course water, occasionally milk, but still decline to lay any to speak of. The hens are mostly yearlings, and none more than two years old; the hens and most of the pullets R. I. Reds. E. S. B.

Torrington, Conn.

Perhaps hens can be made to lay, but I doubt it. They may be furnished with all the materials necessary for their bodily wants and the production of eggs, and given surroundings congenial to their tastes, and yet, until that mysterious vital force within them sets in motion the reproductive functions, eggs will not be forthcoming. That activity of the reproductive organs may be increased by selection in breeding, and by proper feeding, no one doubts, but outside of the comparatively narrow limits of this control, no one can "make" a hen lay. Your care and feeding of your hens seem good, assuming that they are comfortably sheltered, but their age is such as to make it improbable that they will lay much before Winter begins to merge into Spring. One and two-year-old hens are pretty apt to take a rest in early Winter, regardless of their care, and if eggs are wanted then, early pullets must be depended upon. M. B. D.

I have about 65 six and seven-months-old White Leghorn pullets in an open-front house, 7x15 feet, with a 7x18 scratching shed attached. I feed a quart of wheat in the litter in the morning, three quarts of milk thickened with bran, about 10 o'clock a half gallon of oats and eight or 10 heads of sorghum just after noon, and all the whole corn they will eat at night. They have access to milk, water and crushed oyster-shell at all times; have been cutting green sod and cabbage for them. I am getting very few eggs. Can you suggest the reason and make out a ration that will suit better. How much sprouted oats should be fed daily to a flock of that size? Should I feed meat scrap in addition to that ration or does the milk take the place satisfactorily? A.

Brookville, Ind.

I would suggest a more simple method of feeding as one that should give equally good results and save you labor. A dry mash kept constantly before your fowls, in hoppers, and mixed whole grains fed twice daily in the litter will supply the grain that they need, and green food, milk, etc., can be added according to their needs. With an unlimited supply of milk, I should not give them meat food in their mash, though a small percentage, say, one-eighth part by weight, would undoubtedly help. Sprouted oats, in layers from one to two inches deep, are usually fed in about the proportion of one square inch per fowl, daily. They are not needed where other green food is available. A good dry mash formula consists of 100 pounds each of corn meal, wheat bran, wheat middlings, gluten feed, and beef scrap. Where milk is fed, the meat scrap may be much reduced in quantity, or omitted. M. B. D.

Roup.

Recently I purchased 20 hens which I put in with other birds. The new ones now have swollen heads and mucus runs from eyes and nose. The first one taken sick made a rattling sound when breathing. I removed that hen to separate quarters, but each day since one or more hens have shown symptoms of cold or roup. They have been removed from the general pen. None of the stock which I had previous to buying this lot, has been affected. I have disinfected the drinking water with permanganate of potash, and sprayed the roosts with pine tar to try to break up the gathering in the head. What is the trouble and how can I stop it? L. L.

Worcester, N. Y.

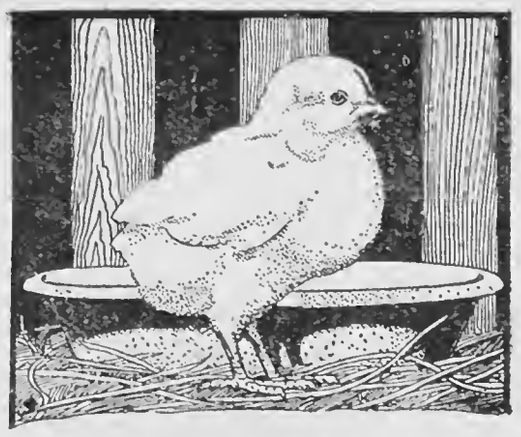
You have evidently had the misfortune to introduce the infection of roup into your flock, probably with the newly purchased fowls. Isolate at once all fowls showing evidence of "colds," and unless they are birds of more than ordinary value, you had better kill and bury all that are seriously sick. While they may recover, they will be more than likely to spread infection to your other flocks and be a source of continuous damage to you. As a disinfectant for internal use, dissolve an ounce of permanganate of potash in three pints of water and use a pint of this stock solution to every two quarts of water given the fowls for drink. You can also dip the heads of the affected fowls for a few seconds into the stock solution, causing them to snuff up a little of it into their nostrils. It will be well to give the permanganate solution to the healthy flock that has been exposed to infection for a while as a preventive, for, after all, prevention is better than cure, and the ax is the best remedy. Do not permit healthy fowls to use utensils that have been in the infected pen until these utensils have been disinfected with *boiling* water or chemical disinfectant. M. B. D.

Injured Foot.

I have a fine Buff Plymouth Rock cockerel which has lost his nails completely on one foot. Scales on lower part of leg and toes are somewhat distended and exposed toes where nails are off seem to have bled. Legs do not have appearance of usual scaly-leg, but it may have not become visible much on surface yet. I expected to show bird at exhibition but cannot on account of foot, and would be glad to receive any suggestion from you as to treatment. L. T. R.

Schenectady, N. Y.

As scaly-leg of sufficient degree to cause loss of toes would be very marked, I think that there must have been some injury or other cause for the trouble in this cockerel. Perhaps the foot was stepped upon by some larger animal; or the bird may have injured his foot in jumping from a high perch, or in scratching for food. Without more definite knowledge of the cause, the only treatment that I can recommend is to clean the foot thoroughly with soap and warm water, and if there is no pus formation or other evidence of a foreign body in the foot, to anoint the raw surfaces with some simple antiseptic ointment, like 5% carbolized vaseline, and place the fowl in a coop by itself with clean soft litter to walk upon. M. B. D.



Don't Take Chances With Chicks

You can eliminate guess-work and reduce feeding to certainty by using H-O Steam-Cooked Chick Feed. It contains the right grains in the right proportions. And the steam-cooking makes it more easily digested and assimilated than any other chick feed made.

H-O Steam-Cooked Chick Feed

is a scientific mixture of Corn, Cut-Oatmeal, Cracked Wheat, Kaffir Corn, Peas and Millet—*steam-cooked* by a special process in our mill.

Sold only in 10-lb., 25-lb., 50-lb. and 100 lb. bags, with tag showing guaranteed analysis. If you cannot get H-O Steam-Cooked Chick Feed, Intermediate Scratch, Scratch Feed, Poultry Feed, Dry Poultry Mash or Chick Feed from your dealer, write for sample and prices.

THE EGG-LAYING CONTEST.

The eighth week of the contest ending December 26 shows a slight falling off in egg production. The number laid was 975, as against 1,004 the week previous. Tom Barron's White Wyandottes have become the leading pen; their total is now 293. Francis F. Lincoln's White Leghorns have held first place in the total score until this week; their total is now 287, giving them second place. Tom Barron's White Wyandottes are first in the weekly score with an output of 47 eggs. This is the third week in succession that they have outlaid all other pens. The next highest weekly score is by the pen of White Leghorns from Storrs Agricultural Station, the "sour milk" pen; they laid 40, and their total to date is 235. Cecil Guernsey's White Leghorns laid 39 and Merrythonght Farm's White Wyandottes laid 35. With the exception of one pen, there is an extra good lot of Wyandottes entered this year; their pen average including the lowest pen, is 187.6. Cutting out that lowest pen the average of the rest would be 221 eggs per pen. The two pens of R. C. Rhode Island Reds come next with a pen average of 101.5. The White Leghorns are third with a pen average of 89.5; the Barred Rocks are fourth with an average of 73; the S. C. R. I. Reds average 66.5; the Buff P. Roeks 47.5. The White P. Rocks 20.1; the Buff Wyandottes 23.2. The White Laced Red Cornish and the Silver Campines have not laid an egg yet. Below are some of the highest producers in the various breeds:

There are two pens of mixed breeds entered by "Profitable Poultry" Magazine. There record is 20 and 25 for the week, and total 110 and 87 respectively.

I noticed last week the unusual number of birds that were moulting. The same thing is true of the birds in the "North Americans" contest at Thorndale, Penn., and a correspondent in Alabama writes me that some of her birds have gone through two moults this year. Tom Barron has a pen of White Wyandottes, and a pen of White Leghorns in the Thorndale contest, and his Wyandottes are walking right up to the head of the procession; they are two eggs behind Chas. D. Bartholomew's White Leghorns now, but one more week will probably see them at the top, for Barron's five birds laid 25 eggs last week, and Bartholomew's laid but 16. Barron seems to have put his skill on White Wyandottes this year; I wonder if he is trying to show the American people that after beating them out of sight with White Leghorns, he can take an American breed and beat their Leghorns or any other breed with them. GEO. A. COSGROVE.

Keeping Flock Record.

Discussing the taking of a flock record of pullets, I claim that the record should begin from the time the first pullet laid in the flock, and not to wait till they were all laying. I have a flock of 30 Buff Leghorn pullets that commenced to lay Nov. 10, 1912, and average 152 eggs per bird to Nov. 10, 1913. In balancing up my accounts for the year 1913 I am puzzled how to credit the raising of 20 Partridge Rock pullets and cockerels, (12 pullets and eight cockerels). My feed bill for the whole flock, 32 Buff Leghorns, and raising the Rocks, is $57.18. About how much should I charge against the Rocks, and what valuation should I credit them with? They have laid about $4.40 worth of eggs.

South Bend, Ind. M. S.

A flock record, as you suggest, commence with the first egg laid by any member of the flock, as the whole flock, and not any individual hen, is the unit here. It would be fair to charge the young stock eight to ten cents each per month as the cost of raising, and they should be credited with the value of all eggs laid and their own market value at time of inventory.

DON'T OVER-ESTIMATE YOUR STRENGTH

Very cold air obstructs perspiration and occasions colds, coughs, catarrh, and rheumatism as well as throat and chest troubles.

To avert this condition, nourish your body with the known and proven winter food-medicine, ***Scott's Emulsion,*** which makes *rich blood* to warm the body; creates energy and vitality to endure the climatic changes of winter.

No alcohol or opiate in SCOTT'S —just predigested nourishment of superior medicinal value.

PUBLISHER'S DESK

Loss of $129,000,000 in two years by the unsuspecting public through swindling operations carried on by use of the United States mails has stirred the postal authorities to a drastic campaign against fraudulent schemers. Wholesale use of the Government's right to deny the mailing privilege to persons or firms whose operations may be tainted with "get-rich-quick" and other false promises is the weapon to be employed.—Daily Paper.

This is encouraging. Years back, under the intelligent and efficient direction of Judge Goodwin, fraud orders were issued against fraudulent schemers, and the swindling of the people then stopped as far as that particular scheme was concerned. Of course, all the crooks set up a howl as soon as one of them was denied the use of the mails to swindle. Some of the crooks had influence in politics, and a few of them actually had seats in Congress. The cancer cures, the medical fakes, the stock-jobbing swindles and fake mail-order publishers pooled their interests, and a general fight was put up against the fraud order. The cry went up that there was a czar in the Post Office Department, clothed with the authority to destroy business, to kill vested interests, and to deny the individual his personal rights and liberties. Charges of graft, and dishonesty, and partiality and prejudice were made freely against the Department. All this, of course, originated with the schemers, and largely in the fake publications that they controlled as a part of their swindling game. Much of it was repeated in the daily and weekly papers of the country. Some of the papers were, no doubt, innocently led to lend themselves to the rogues, and the help of others was secured through large advertising contracts. The accusations were so often repeated against the Department many people thought they must be true, and thus the swindlers by perseverance actually won over the support of honest men. So when the "fraud order" was issued against E. G. Lewis and his swindling schemes at St. Louis, the conditions were just right for his campaign of villification of the Department. Finally the Attorney-General gave orders that no more "fraud orders" be issued, but that evidence be gathered against the crooks, and criminal action brought against them in the courts. That suited the crooks to perfection. Astute lawyers were retained to word their schemes so as to keep within the law, and at best it would take years to make up a case against them, and then years before the case could be brought to trial. As a last resort there is always a chance of getting one or more crooks on a jury, and it is not always easy to convince twelve honest men that a schemer had deliberately set out to swindle. He would admit the failure, but set up the pretence that he expected it to succeed, and if a single juryman had doubts about his intent to defraud he went free. So it has gone on. An occasional crook has been convicted and sent to jail for a few months or years; but the swindling has gone right on. The climax was reached last year, when a Congressional committee took up an investigation of the E. G. Lewis case, including his hysterical accusations against Judge Goodwin and the Post Office Department. This committee was headed by Congressman Ashbrook of Ohio, and then Congressman Redfield, of Brooklyn, N. Y., now Secretary of Commerce in President Wilson's Cabinet, was an active member of the committee. The personnel of the committee had recently been changed from a Republican to a Democratic majority. Lewis was under indictment for alleged fraudulent use of the mails. For some reason that has never been accounted for Messrs. Ashbrook and Redfield took up the defense of Lewis. They defended him all through the lengthy investigation, and kept the Department on the defensive. They even went to St. Louis to give a hearing to those who would testify in favor of Lewis. When the record was complete Lewis had not substantiated a single one of the charges against Judge Goodwin or the Government, and the evidence was so overwhelming against Lewis that the case fell of its own weight. The Department was fully justified in its action, and the Democratic members of the committee made a perfunctory report denying that they believed Lewis guilty of fraud, but admitting that he had lost the money sent him by poor people, and advising him to go home and go to work. We do not know whether the investigation was conducted for the purpose of keeping Lewis out of jail or not; but if so, it seemed to be ably conducted for the object in view. The jury that tried Lewis did not agree, but we believe the indictment still stands; and he is now working a new scheme. Aside from the Lewis case, the Ashbrook committee showed great sympathy with cancer cures, and some other crooks of the kind which had grievances against the Post Office during the Roosevelt and Taft administrations.

Now the Attorney-General, a fellow member of the Wilson Cabinet with Mr. Redfield, reports that the criminal processes are too slow, and that "fraud orders" will again be issued against the swindling schemers. It is the strongest reproof that has yet been issued against the committee that put itself on record as apologists and defenders of crooks. This announcement of a saner policy comes none too soon. It will be remembered that at the beginning of this Administration the crooks took courage, and predicted that prosecutions would cease. They evidently got comfort from the Redfield appointment; but we reminded them at the time that no Administration could afford to permit a free use of the mails for swindling purposes, and least of all need they expect such a concession from President Wilson. By all means let us have the "fraud order" restored, and put a stop to the swindling before the people have lost their savings. It is little satisfaction to send a rogue to jail for a few months after his victims have lost their savings through him.

I have been so long in replying to your letter that I fear you will think I failed to appreciate your aid in securing a settlement, but that is not the fact. I was so rushed with work that I failed to realize how much time had slipped away. I do appreciate your help in this matter very much and should be glad to express it financially did I not know that you have a hard and fast rule to the contrary. As it is I shall endeavor to say a good word for THE RURAL NEW-YORKER when opportunity offers, and hope to send you some trial subscriptions later.

New York. N. M.

A case of eggs sent to a Newark commission house was lost in transit by the United States Express Company, and it took just eight months to get them to pass voucher in settlement.

I would like to purchase a good small farm near a good market. Would it be well for me to purchase such through the E. A. Strout Farm Agency? Would you consider them reliable people to do business with? J. H. L.

Massachusetts.

This man being a new subscriber, he is not familiar with all that has been said about the Strout record in selling farms. So we repeat. In the past this agency claimed that it could not afford to sell farms on the commission plan; that it did not conduct an agency, but a brokerage business; that its contract with the seller was an option; that they sold for profits, not commissions; and that they were entitled to all they could get above the seller's price. They gave prizes to the local agent who, during certain months, sold a farm at the highest price above the owner's price. The profits in these cases as reported by themselves ran from 50 to 72 per cent. Since THE R. N.-Y. called attention to these methods they have asserted that they are now selling on commissions running from 10 to 20 per cent. They previously stated that they could not sell on these terms to a man who knew that he was to pay this commission. If this be true, and we think it is, the buyer must be kept in the dark or deceived, in order to make a sale to him. But we have record of a recent transaction where the buyer paid 46 per cent above the seller's price, and gave up in exchange, besides an equity in another property equal in value to the price of the farm. Such is the record. A buyer is entitled to know all the facts concerning his purchase. If he knowingly wants to pay an agent 10 or 20, or 50 or 72 per cent for his services, he ought to have the privilege of doing so, but is entitled to the information. We do not think that you will get it from the Strout agency; and we doubt if you can get it straight from the farm papers that publish the Strout advertising. J. J. D.

ACME

Pulverizing Harrow

Produces Better Crops

Because it makes a *better* seed bed than other harrows. It has long sloping knives that *cut under* the soil, thoroughly *pulverizing* and *mixing* it. They level the soil and leave a fine mulch on the surface that holds moisture in the ground.

The roots find nourishment easier in the compact seed bed.

The ACME Pulverizing Harrow is the only tool needed after your plow. It is easier on your horses, while giving better results.

Sold by all John Deere dealers. Let us mail you descriptive literature. You can grow better crops. Address

DUANE H. NASH, Inc.
379 Division Ave. Millington, N. J.

Hens on Old Run.

I have had some trouble with my hens and pullets this year in their laying. I would like to get your idea on keeping hens on the same piece of ground over three years at a time. I think the ground gets diseased and causes a fever in their feet. H. L. L.

East Greenwich, R. I.

The length of time that fowls can be kept upon the same piece of ground depends upon the number of fowls and size of the run. It is not wise to try to keep a large number of fowls upon a small piece of ground for many years in succession, unless the ground can be cultivated occasionally and the surface renewed. It is true that the soil of an old chicken run becomes inoculated with various disease germs and makes the rearing of healthy poultry upon it difficult. If the buildings cannot be moved, the ground should be plowed and cultivated as often as practicable.

Ration for Heavy Fowl.

Will you give me a balanced ration for the heavy type of fowls? I keep R. I. Reds, and if I fed the same as for the lighter and more active breeds they would be so fat they would not lay at all. B. B.

Oneida, N. Y.

The heavy breeds of fowls are fed the same grains and mashes as the lighter ones, but more care is needed to see that they do not become over-fat and sluggish. Their grain should be fed in deep litter to make them exercise while finding it, and it is probably better not to keep dry mash constantly before them. Their dry mash hoppers can be so arranged as allow the fowls access to them only part of the time, say afternoons, and corn and cornmeal should not be quite so literally fed as to the more active breeds. The following mash has been recommended by the Maine Experiment Station where Plymouth Rocks have been bred for many years. 100 pounds each of wheat bran, middlings, cornmeal, and gluten feed; 50 pounds of animal meal and one quart of salt. Wheat, corn and oats are used in the whole grain ration which at one time consisted of four quarts of shelled corn per hundred fowls scattered upon the litter early in the morning, and two quarts each of wheat and oats fed in the same way at 10 o'clock. At that time the dry mash was kept constantly before the fowls.

Feather Pulling.

My pullets are fine, but from the vent to the top of the tail are entirely bare, and they seem to pick each other there. What can I do to stop it? My dry feed consists of 150 pounds wheat bran, 100 mixed feed, 75 pounds beef scrap.

Washington, N. J. T. F. B.

Feather pulling is a vice that is often responsible for this loss of feathers, and is sometimes difficult to stop. If the worst offenders can be caught they should be removed from the flock for a time. As the irritation of lice and mites may start the trouble, pains should be taken to rid the fowls of these parasites, and the bare spots should be annointed with 5% carbolized vaseline. See that the fowls have plenty of grit, charcoal, and animal food like skim milk or meat scrap, and give them as much liberty as possible.

Ten Good Hens.

One year ago you published my results with 18 Leghorn pullets during the year ending November 1, 1912. In 1912 I raised 22 pullets, and on November 1 put them, with the 18 hens, in an open-front house eight by 12 feet, on a city lot. Three hens died and four were eaten. On hand November 1, 1913, 31 hens from 18 months to 30 months old. They were fed dry mash all the time, scratch feed twice a day, scraps from the table, and I kept a stick of sulphur in their drinking water. The financial result follows:

DEBIT.

Stock at inventory, Nov. 1, 1911	$53.00
House at inventory, Nov. 1, 1911	72.45
Int. on house investment, 1911-12	4.35
Feed, grits, etc.	40.38
Total	$170.18

CREDIT.

By house, less ten per cent. depreciation	$65.21
Stock raised one duck, one pullet, and eaten	4.05
Stock on hand, Nov. 1, 1912	27.10
Eggs, 344½ doz.	126.16
Total	$222.52
Balance to profit and loss, Nov. 1, 1913	$52.34
Balance to profit and loss, Nov. 1, 1912	61.92
Total profit, two years	$114.26

The pullets the first year averaged 134½ eggs each; the old hens averaged the past year 118 eggs each. I shall keep them the coming year. I got as high as 65 cents a dozen for eggs. The lowest price was 30 cents. E. Y. BRECK.

Pennsylvania.

Poultry Watchdog.

What is the best watchdog, i. e., making the most noise? The dog is wanted for chicken yards. A. C. B.

For noise one of the small terriers like a black and tan, will satisfy anyone. For real business an Airedale is hard to beat.

Chicken Cholera; Fish in Spring.

1. What can be done for chicken cholera? 2. Is it harmful to have trout in the spring water for drinking purposes? J. F. H.

True fowl cholera is a malignant disease which is difficult of control and requires the most thorough methods if it is to be eradicated from premises where it once gains foothold. There is no known cure for it, and prevention lies in promptly isolating all fowls showing evidence of the disease, burning or burying deeply all that die, and thoroughly disinfecting the quarters and utensils used by the flocks. This disinfection is accomplished by cleaning up and burning all litter and loose dirt, and spraying perches, walls, etc., with a 5% solution of carbolic acid, or other equally strong germicide. Utensils may be disinfected by free use of *boiling* water. Continuous work is necessary until the disease is conquered. "Cholera" is a term loosely used among poultrymen, and is frequently applied to any serious diarrhœal disease, even though the germ of true cholera is not present. 2. I do not know of any harm done by trout in spring water that is constantly flowing, though I should much prefer that they be kept in a pond supplied by the overflow, rather than in the spring itself. M. B. D.

Farm Hands and Laborers Supplied Free
We have many men anxious to learn farm work.
C. K. Blaichly, United Charities Bldg., 105 E. 22d St., N.Y City

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages.

GARDENER, married, thoroughly experienced, wishes position on gentleman's estate; 20 years with last employer. GARDENER, 881 Whalley Ave., Westville, Conn.

POULTRYMAN — Single, experienced, college trained, desires position as assistant to expert poultryman on large plant; references; state wages. Address S. E. K., care R. N.-Y., 333 West 30th St., New York.

WANTED experienced woman for housework on fruit farm; must understand butter making; two in family; modern house. H. W. COBB, Ridgewood, N. J.

MARRIED COUPLE wanted on country place; man to care for garden, one horse, and be generally useful; wife to cook for family of three; no laundry. Good home for sober, settled couple. Write wages wanted and give references. D. LEE, Benson, Md.

MAN AND WIFE—No children; working farmer, gardener, fruit pruning, all farm animals, incubator; no dairy; decent hours; good permanent home in Connecticut for honest, industrious, sober, capable man; wife for general housework; reference required. H. R. E., care R. N.-Y., 333 West 30th St., New York.

OUR GRADUATES will be ready to accept positions as dairymen, poultrymen, horticulturists and general farm help on March 1st, 1914. Applications will be considered in the order received. Address BARON DE HIRSCH AGRICULTURAL SCHOOL, Woodbine, N. J., Dept. B.

MAPLE GROVE FARM—Products direct to Consumers. ROUTE 24, Athens, Pa.

WANTED—Horse-power tile ditching machine. WELLS LOGAN, Bowling Green, Ky.

FOR SALE—File of Rural New-Yorker for 25 years, with yearly indices; submit offers. J. F. ROSE, South Byron, N. Y.

HANDSOME STRING HAND-MADE BEADS—Lavender, red, pink and buff; $1.50. MARY A. FELTHOUSE, Elkhart, Ind.

WANTED—Weaned Ayrshire heifer calves or yearlings; carload if price and quality right. WILLIAM HART, Waukon, Iowa.

WANTED—Apple tree wood to make Self-setting Planes. GAGE TOOL COMPANY, Vineland, New Jersey.

NICE BRIGHT HAY FOR SALE—Clean Timothy, or Alsike and Timothy, mixed, $16.50 f.o.b. Addison; sample on application. U. SHUMWAY, Addison, N. Y.

WANTED LARGE FAMILIES—Just a few more to eat my fancy fresh Jersey dairy butter; in 5-lb. boxes; 40 cents per pound and postage added; better than creamery. D. A. KNEELAND, Mountain Home Farm, Waitsfield, Vermont.

WANTED—To communicate with party owning large estate or abandoned farms by a man thoroughly up to date in farming and gardening, reclaiming of land, and eventually putting same on self-supporting basis; Eastern States preferred; salary and percentage of profits. Address G. E. H., care of FRANK BRUNTON, Horticulturist, etc., R. F. D. 5, Norfolk, Va.

FARM FOR SALE—225 Acres. Apply to owner, BOX 337, Emporia, Virginia.

$500 CASH buys 54-acre farm, balance easy terms. W. L. HOFFMAN, 129 Herkimer St., Buffalo, N. Y.

$1,300 BUYS FINE 30-acre farm near Troy; sightly location. DEAN, Seventh St. and Seventh Ave., Troy, N. Y.

12-ACRE FRUIT FARM—7 acres grapes; other fruit, pasture; house, barn; $3,500. N. C. JACOBSEN, St. Joseph, Mich.

FOR SALE—80-Acre Farm, good buildings, large orchard, telephone, home markets, 80 miles from New York. FRANK FAULKNER, Mount Bethel, Pa.

FOR SALE—100-acre farm on Honeoye Lake; fruit of all kinds; well adapted to fruit or grain; extra good house (20 rooms); two barns; well of fine water; two miles from State road; high school in district. A. J. BRAY, Honeoye, N. Y.

WILL SELL my big ranch in Sunny, Colorado, entire or cut up into small farms to suit. A moneymaker; 2,500 acres; $10 up, according to choice; long time if desired. For particulars address owner, PERL T. BARNHOUSE, Gary, Colo.

VERY UNUSUAL OPPORTUNITY—118 acres good land with extra fine pasture, never failing water supply; extra good house, good barns and tenant house; finely located on State macadamized road between Utica and Oneida, only one mile from town and five minutes' walk from trolley station; $100 per acre, to close an estate. No exchanges; terms reasonable. J. H. FORT, Oneida, N. Y.

FOR SALE—Small poultry and fruit farm. Borders large pond with fine fishing. Edgewater Farm, Dover, Del.

RELIGIOUS FREE LITERATURE—Unitarian—Postoffice Mission. Address, Mrs. F. M. McGarry, Grafton, Mass.

CHESTER WHITES OR O. I. C.'s
Now is the time to order Spring Pigs from large, growthy, prolific sows. A few Fall boar pigs left, also ten December pigs. All stock registered, either OIC or Chester White Record. VICTOR FARMS, Bellvale, N. Y.

207 Prizes Won
At the large Eastern State Fairs last Fall tells the quality of our drafters. 80 Percherons, Belgian and Suffolk stallions and mares priced right. Registered Percheron foals of 1912 and 1913 at $200.00 to $500.00 each. For actual photographs and interesting information ask for Bulletin H
ADIRONDACK FARMS, - Glens Falls, N. Y.

Free Duty

You Now Save $15.25

Imported direct from Belgium

The wonderful French-Belgian Melotte now comes in free of all duty. The tariff is off. The world's greatest cream separator—the superb, grand, prize-winning Melotte—can now be secured by American farmers without paying the high duty—at a price $15.25 lower than ever before outside Europe.

You win! Yes, you get the benefit of this new free tariff. You save the high duty. This wonderful imported cream separator—the most efficient and scientific the world has ever seen—the incomparable Melotte—is now ready for you. Introduced a year ago, it swept the country even with the duty on. Those who knew cream separator values were glad to pay it. But now the tariff is off—you save all—the Chicago price is the same price as you would pay in Belgium—plus only $1.75 for water freight.

And it is now being offered on the most sweeping and sensational introductory offer—positively the first bona fide, no-money-down offer ever made on any cream separator—American or foreign. An amazing make-good or send it back offer.

Greatest Cream Separator Offer

No manufacturer of any cream separator—foreign or American—ever dared to make such a startling offer before. All others who have pretended to offer you a free trial have taken care to get something out of you first. ***But we don't want anything.*** A simple request brings the great Melotte—direct from Chicago to any responsible farmer—so it can positively prove its absolute superiority.

Read every word of this great offer. It proves our absolute faith in the great Melotte Cream Separator. You are given the opportunity of seeing just how much cream this marvelous separator will extract from your milk before we ask you to send us one cent. You never saw another manufacturer who was so open-handed in his offer. The reason is that no other manufacturer ever wanted you to know all about his machine before paying him anything. ***We do.***

The Melotte bowl hangs down from a single perfect bearing and spins like a top. It will continue spinning for half an hour after you stop turning crank unless you apply brake. Patented self-balancing bowl is entirely automatic. You can't get it out of balance and so perfect is the balance that it is impossible for it to vibrate and affect the skimming efficiency like other separators. The bowl chamber is made of special cast iron, porcelain lined with white bath tub enamel. The Melotte is easiest to clean, perfectly sanitary and will last a lifetime.

Absolutely guaranteed for 15 years.

Sent Without a Penny Down —30 Days Free Trial

Your simple word that you would like to see this cream separator in your own barn or dairy house brings it to you instantly. We send you the Melotte without a bit of quibbling or hesitancy. We neither ask nor want you to send a penny. We don't want a cent of your money. You set it up, give it a thorough test with the milk from your own cows. We give you a free trial that IS a free trial in every sense of the word. It is a free trial because we don't ask you to pay us any money down—there is no C. O. D.—no lease nor mortgage. You keep your money right in your own pocket.

Some people PRETEND to give you a free trial, but they ask you to give them your money first. We are not afraid to let our separator speak for itself. Test the Melotte Cream Separator in every way, watch your profits go up, watch the increase of the amount of cream, then, if you do not believe that you ought to have a cream separator, just send it back at our expense. If, however, you decide to keep the genuine Melotte, we will allow you to keep it on extremely easy

Monthly Payments

These monthly payments are so small that you will hardly notice them. You only pay out of your increased profits. You don't need to be without a cream separator when you can have the separator right in your dairy house while you are paying for it. In reality you do not pay for it at all. It pays for itself.

That is what we want to demonstrate to you. We want to demonstrate and prove beyond all peradventure that the Melotte Cream Separator *does* pay for itself. Only a few months' use of a Melotte Cream Separator and you will be satisfied that this statement is **absolutely correct.** A few months and the separator has paid for itself. It does not cost you a penny because the increased amount of cream has paid for the machine. We don't want to tire you here with a long discussion of how our cream separator is made. You can best understand this if you will let us send you our free catalog.

Wonderful Record of The French-Belgian Melotte

Half a million Melottes are in daily use all over the world. Recognized as the world's best separator. The Melotte has won over 180 International prizes. One Melotte has been running at Remincourt, Belgium, the equivalent of 54 years' of actual work without appreciable wear. Think of it! Every part is made at the factory at Remincourt, Belgium, by French and Belgian mechanics, and comes just as it is packed in foreign factory.

The reasons for its superiority are plain. The bowl hangs down and spins as though running in oil, It can't get out of balance. There is nothing to get out of alignment and wear out bearings. The bowl-chamber is lined with special indestructible white enamel. The Melotte runs like new after ten years' use.

World's Grand Prize Winner

Here are a very few of the hundreds of grand world's prizes the Melotte has won. The entire list would cover this page:

1888—Brussels—International Exhibition—Progressive Prize.
1894—Medal of Higher Merit.
1895—Vienna—First Prize.
1897—Brussels—World's Exhibition. First Prize.
1898—London—First Prize.
1900—Paris Gold Medal and First Prize.
1903—London Gold Medal and First Prize.
1904—St. Louis—First Prize.
1906—Milan—First Grand Prize.
1907—Amsterdam—First Prize.
1911—Brussels—Grand Prize and First Gold Medal.

Valuable Book, "Profitable Dairying," Free

Just ask for this book and it will be sent to you. It is free! Place your name on the coupon, cut it out and mail it at once. Then we will send you our great free book, "Profitable Dairying," telling you everything about cows and dairying, butter and cream—how to feed and care for cattle, how to make them more valuable than they are now, how to make more money than ever before out of your cows. This book is written by two of the best known dairy scientists in the country—Prof. B. H. Benkendorf, Wisconsin Dairy School Agricultural College, Madison, Wis., and K. L. Hatch, Winnebago County Agricultural School, Winneconne, Wis.

Send the Coupon Today —It Brings Free Book

We will also send Our Free Catalog, describing fully the Melotte Self-Balancing Bowl Cream Separator and telling all about our liberal terms. Find out about these terms anyway, even if you don't expect to buy a cream separator *just now.* Remember—no money down, free trial and easy payments on the greatest European separator—and we let the separator tell its own story. You see with your own eyes why we can afford to guarantee this separator for 15 years. The most sensational offer ever made in connection with a cream separator. Our catalogue tells all about it. Don't delay. **Sign the coupon right now!**

The Melotte Separator
19th Street and California Avenue
Dept. 4291 CHICAGO, ILL.

Test With Other Machines

Before you decide to buy any Cream Separator arrange to test a MELOTTE along side of the machine you now think is the best separator in America. We want you to do this. Then there can be no doubt in your mind as to whether you are really getting the best machine. This is the only way to buy a cream separator. Then it will not be necessary to take anybody's word.

You'll know which machine turns easiest—which machine is the best made. You'll know which skims the closest. You'll know which will make you the most money.

Write to us about the MELOTTE and the MELOTTE FREE TEST today. We are the sole factory representatives in America.

Send the Free Coupon Now —Today
Don't Delay

CUT OR TEAR OFF ALONG THIS LINE

THE MELOTTE SEPARATOR, Dept. 4291 19th St. and California Ave., Chicago

Kindly fill in the coupon and we will send you free and prepaid our book "Profitable Dairying," by Prof. G. H. Benkendorf and Prof. K. L. Hatch, the Wisconsin Dairy Experts. We will also send you our free Melotte Self-Balancing Bowl Cream Separator Catalog, explaining our no-money-down and easy monthly payment offer on Melotte Cream Separators.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII., No. 4240. NEW YORK, JANUARY 31, 1914. WEEKLY $1.00 PER YEAR.

A STUDY OF SOD MULCHED ORCHARDS.

The Famed "Hitchings" Method Compared.

During the past 10 years we have had much to say about the so-called sod method of handling an orchard. Much of this talk has centered around the orchard of Grant Hitchings, near Syracuse, N. Y. Mr. Hitchings was the pioneer in New York State for this method of growing apples, and he has persisted in his argument that cultivation was neither necessary nor wise for his orchard. Hitchings has been successful. He has developed a very profitable business in apple culture and has succeeded in winning more prizes at the State Fair during the last 15 years than have been awarded to any other orchard in the Empire State. The success of Mr. Hitchings induced many other growers to follow his method; some with success, and others with failure. The trouble was that some of these growers did not understand just what Mr. Hitchings advocated, and they did not follow out his plan carefully. In other cases the orchards were located on land that was not naturally adapted to grass, and sod culture under these conditions in many cases meant simply neglect. Prof. Hedrick of the Geneva Experiment Station has been conducting some careful experiments in the Hitchings orchard, and also in another orchard of Western New York, to test out this difference between thorough culture and sod. At the recent meeting of the New York State Fruit Growers' Association, Prof. Hedrick gave a very thorough report of the results in this Hitchings orchard, and laid down certain conclusions as the result of his investigation. He gives this description of what is known as the Hitchings seed mulch method:

What is the Hitchings method? The term has become the sound-symbol for a mixture of more or less vague practices connected with sod in orchards; sod pastured with sheep, hogs or cows; sod of Blue grass, Orchard grass, clover, Alfalfa or weeds; sod from which the grass is cut for hay, or cut and piled about the trees, or going uncut; sod supplemented by straw, manure or other by-products; sod the growth of years and sod turned under more or less frequently. This confusion has spread obscurity over much that has been said about the method. The description of his treatment, now to be described, must be kept in mind.

In the Hitchings method the ground is laid down to sod before or as soon as the trees are set, and the grass is cut for a mulch once or twice per season as conditions may demand. The orchard remains in sod indefinitely, since plowing is supposed to be detrimental to the conservation of the mulch which is the essential of the treatment. The cut grass is not removed from the land and until roots and branches utilize the space between plants, it is raked and piled about the trees.

Prof. Hedrick states that before starting the commercial orchard Mr. Hitchings had been a dairyman, and we understand that the most successful part of this orchard was formerly a pasture. The farm is on highly rolling bottom land on the hills of a deep valley. The land in the orchard is too steep for definite cultivation, and under constant tillage more or less washing would occur. Moist and springy land may be looked for at the foot of high elevations. This occurs in the Hitchings orchard. The soil at all seasons contains much water, although open ditches have been dug to carry this water away. This seepage down the hillside is one of the dangers which bring success in the peculiar sod mulch culture of this orchard.

"PEACHES" IN GOOD APPLE CULTURE. FIG. 54.

Scene in a Western New York Orchard Near Apple Picking Time.

In conducting the experiment various plots of ground were laid off, so as to give a fair comparison of soil and apple variety. Some of these plots were given thorough culture, while others were conducted on the sod-mulch plan, and as careful records as possible were kept of yields, quality, cost, and other factors. These reports are too long to give in full. In a general way it may be stated that four varieties of apples, 10 years set at the beginning of the experiment, and 20 years at the end, bore an average of a little less than four bushels per tree under sod, while those in tillage gave a little more than three bushels per tree. The difference in favor of sod was four-fifths of a bushel per tree. The percentage of poor fruit was much higher in the tillage section than in the sod. This was largely due to the fact that much of the fruit was harvested by permitting it to drop to the ground, and, of course, under this plan the sod provided a softer and cleaner place for falling. As to the size of the apples, year in and year out there was very little difference in the two sections. Of course the apples from the sodded plots were more highly colored than those from the tilled. It has been settled that sod increases the color of apples. Prof. Hedrick says that another rule generally holds good: that color is antagonistic to yield of fruit, and to growth of trees. In the address from which we are quoting, Prof. Hedrick makes this statement:

> The correlations between color and quantity and color and growth of tree need a further consideration. Every orchardist of experience in this region knows that girdled, wounded, diseased, decrepit, or poorly nourished trees bear more highly colored fruit than healthy, normal trees. Indeed, in this day of almost universal tillage in commercial apple orchards one of the common questions is: "How can I check growth and obtain more highly colored fruit?" High color in red apples is as dependable an indication of ill health in the tree as high pulse or high temperature is in the human being. In growing apples we can usually say at once that high color is purchased at the expense of health or vigor.

As for the size of trees, Prof. Hedrick concluded that those under tillage were rather better than the others, although it was hard to find any particular difference. The trees seem to thrive as well under one method as under the other. The foliage of the trees was on the whole darker and richer where these trees were cultivated, although in many cases there was practically no difference. It was found that the tilled trees usually bloomed and leafed out from one to several days in advance of the trees in sod. It was also found that the foliage of the sod trees was usually first to drop. One argument in favor of

adopting sod culture on steep hillsides is to prevent washing of the soil. One of these cultivated plots was on the hillside in the Hitchings orchard. Prof. Hedrick says that during the 10-year period little or no washing was done by this tillage. This was hardly fair, however, as the cultivated plots are very narrow, and the sod above them would hold the water back. Prof. Hedrick, however, gives the opinion that danger from surface washing on hilly land in New York is greatly exaggerated. Heavy rains are not frequent. Orchard lands are usually more or less stony, and the stones prevent washing to some extent. He says that a wide observation in the fruit-growing sections of New York has not shown many orchards which are badly damaged by wash. Prof. Hedrick even claims that proper cultivation may be made an efficient means of lessening the washing of land.

When it comes to a comparison of cost in handling such an orchard, there is nothing to it, for sod culture is so far ahead that cultivation is out of sight. It cost on the average 72 cents per acre to cut the grass in this Hitchings orchard, and this cultivation with a mowing machine was all that was done. On the other hand, the cultivation for the tilled plots cost $16.28 per acre. This is above the average of cost in the better orchards of New York State. In Monroe County, N. Y., the Auchter orchard also shows an experiment between culture and sod. While the Hitchings orchard is upon a steep hillside, the Auchter orchard is level, and consequently easier to cultivate. In this Auchter orchard the cost of cutting the grass on one acre was 80 cents and the cost of tillage $3.92, or about one-fifth of the cost of cultivation on this steep hillside of Mr. Hitchings. Put in another way, the cost of tillage in the Hitchings orchard was 12½ cents per bushel of fruit, while in the Auchter orchard this cost was one and one-fifth cent. The cost of the apples grown in sod was one-half cent per bushel for cutting the grass, and one-third of a cent per bushel in the Auchter orchard. Prof. Hedrick brings out the point that the cost of tillage is sure to vary greatly, depending upon the land and its location, the tools, the teams, and other conditions; while the cost of cutting grass for the sod-mulch culture will remain much the same everywhere. Giving these figures, Prof. Hedrick summed up the matter as follows, taking into consideration the various soils and economic conditions to be found in New York State. It seems to us that these statements are very fair. There are certainly conditions under which sod culture will pay. Upon our own farm we have two or three places where we believe it is far more economical to keep our apple trees in sod, while in adjoining fields under a little different condition it is clearly evident that some form of culture will pay better. The time has evidently gone by when any rigid or cast-iron rules can be laid down for either side of the argument. The individual grower must take one method or the other and adapt it to the peculiar condition of his own soil and farm. Here are Prof. Hedrick's conclusions:

1. *Orchards on steep hillsides where land would wash badly under tillage may be kept in sod.* We have tried to show, however, that cultivation may be so managed that there are but few commercial orchards in New York in which cultivation need be prevented by soil erosion.

2. *On land covered with rocks, trees may best stand in sod.* Such lands, whether steep or not, must often be kept in sod because of the impossibility of tillage. There are not a few such orchards in New York.

3. *The Hitchings method is adapted only to soils having suitable depth.* That is, soils in which grass roots and tree roots do not come into too intimate contact or too direct competition for food and moisture. The commercial apple orchards of New York are at present largely on lands the top soil of which averages less than a foot in depth. On these shallow soils the Hitchings method usually will prove a failure.

4. *Soils must be retentive of moisture.* To sustain trees at their best under the Hitchings method, soils must not only be deep but must be very retentive of moisture, or have the water table comparatively close to the root run of the trees, or, as in the case of the orchard under discussion, must be fed by seepage from higher ground nearby. On land that annually suffers from Summer droughts the sod mulch treatment will almost certainly prove less beneficial to trees than tillage.

5. *Economic conditions may decide the choice between tillage and some mulching treatment.* The cost of caring for an orchard is very much less under the Hitchings mode of mulching than by tillage. If, then, a man chooses to grow apples extensively rather than intensively, he may make larger acreage in sod counterbalance greater production under tillage thereby bringing the net income to the same level.

In conclusion, the chief lesson the Hitchings orchard teaches is that a man may break away from common practice, when circumstances render such practice difficult or impossible, and yet attain a high degree of success. The Hitchings orchard, then, is a splendid demonstration that new paths to success may be blazed, new practices devised to meet new conditions or old obstacles overcome in new ways. It is an encouraging example of resourceful pioneering and of persistent endeavor to attain the high success. The pith and the point of the work by the Geneva Experiment Station in this orchard is not so much the new method of growing apples, as that fruit growing is intensely individual. The prime factor is the man.

DECEPTIVE STATEMENTS ABOUT PHOSPHATES.

Will you explain to me the meaning of tri-calcium phosphorus, equivalent to bone ash? This is the guarantee printed on the bags containing chick feed, which a friend of mine bought some time ago, and he would like to know what he is feeding his chickens. C. H. W.
New York.

No one can tell what these chickens are eating except the man who put up this stuff. "Tri-calcium phosphorus" is one of these fool or deceptive terms which manufacturers use to confuse their patrons. Phosphorus makes three combinations with lime. The "tri-calcium phosphate" is composed of three parts of lime to one of phosphorus. It is insoluble in water. "Reverted" phosphate contains two parts of lime and "soluble" phosphate one part. The "tri-calcium" is also known as "bone phosphate." This form of phosphate is found in Florida rock, Tennessee rock, South Carolina rock, bones and tankage.

"THE BACKBONE OF THE NATION." FIG. 55.
(Cartoon from Chicago *Blade*.)

From this name you might be feeding any of these substances. "Bone ash" is supposed to be what is left when cattle bones are fully turned to ashes! The "equivalent" in this statement lets the manufacturer out by saying that there would be a certain amount of "bone ash" *if all of the stuff were obtained from bones and all were burned.*" It is an old story how Darwin tells of cattle herders in Patagonia who killed a steer and used the bones as fuel to roast the meat. A Patagonian, however, would be satisfied with meat served very rare, and he has no pressing engagement to hurry the cooking. This so-called "guaranteed statement" in this chicken feed is a good sample of the ridiculous statements made up to fool the public.

CONSERVATIVE FATHER AND PROGRESSIVE SON.

Bert Smith, a well-known dairyman and institute worker of Ohio, tells the following, which is an example of the conservative father and the progressive son:

"The young man, while taking his agricultural college course, told me of the old farm in northern Ohio. As the time of his graduation approached he was at the parting of the way. A position with an attractive salary was open for him. The old farm and the care of the parents demanded his return. I advised the boy that there was but one thing for him to do, and that to go home, care for the old farm, and make the father and mother happy.

"He relied on my advice. I had occasion later to be in the locality, and I looked up the young man. He told me the story of his experience during the months following his graduation. Every effort he made to get out of the old rut was vigorously blocked by his father and mother. The fences were in bad way, and his plan to re-establish new ones was bitterly opposed. The rehabilitating of the barn was denied, and just a few days before the young man had ordered a manure spreader on his own responsibility. The dealer had confidence in the boy, and extended him time, but the parents denounced the purchase. The boy was discouraged with his prospects. He was ashamed of himself and his surroundings. His nerve was broken. In view of conditions which that young man faced," Mr. Smith said, "I regretted the advice which sent him back to the farm.

"I say to the parents," added Mr. Smith, "if the boy is honest and deserving, faithful and hard working, when he comes home from college give him a chance. Stand back of him, bury your old prejudices and give the boy opportunity to apply his learning. A conservative parent can lag behind and exhaust all the boy's pull, and the boy can't get anywhere. Most of us should look forward to the boys, and if they make mistakes let them profit by them. We should sweep out some of the cobwebs from our mental garrets, and when the boy comes back with some good sensible money-making and saving ideas, let us help put them in operation. The policy will bind the boy to the farm with bands of steel, so give the boy his chance; if not, I then say to the boy, accept the salaried position," concluded Mr. Smith.

INSECTS IN STORED GRAIN.

Would an application of hydrocyanic fumigation injure corn in any way? I have constructed a tight corn bin in the barn, and bought the necessary carbon bisulphide, but the stuff was no good, at least it did not kill the borers. From a clipping from your paper I learn how to handle the hydrocyanic. Millions of bushels of corn are yearly devoured here by the weevils, and the natives don't care a straw about any remedies—in fact they don't believe in disturbing nature in her own proper workings. J. D.
Dowling Park, Fla.

The injury by insects to stored grain all through the Gulf States amounts to hundreds of thousands of dollars each year. Those of us who live in the cooler regions of the Northern States, where the Summers are short and the Winters long, have no conception of the losses caused by stored grain insects in the South. In fact, this phase of injury constitutes one of the most serious troubles from insects with which the Southern farmer has to deal. All sorts of ideas and practices are common among the farmers of the Southern States in regard to the control of these pests; but many of the more progressive ones are beginning to build tight bins and granaries in which the grain may be stored and fumigated. This procedure seems to offer the only method of escape from these grain pests.

As to hydrocyanic acid gas for fumigating stored grain, we would be inclined to discourage its use. The gas, however, if generated in the proper way and in correct proportions to the space inclosed, will apparently not injure dry corn for food purposes or for planting. Dr. C. O. Townsend carried on a long series of experiments with hydrocyanic acid gas to determine its effect on dry and damp seeds. His conclusions, in brief, are as follows:

Stored grain and other seeds may be fumigated with hydrocyanic acid gas of required strength and for sufficient time to insure the destruction of insect pests without injury to the germinating quality of the seeds and without rendering them injurious as foods. Dry grains and other seeds may be fumigated with the usual strength of hydrocyanic acid gas for several days, without in any way interfering with the germinating property of the seeds. On the other hand, damp grains and seeds are much more sensitive to the influence of hydrocyanic acid gas than dry seeds. We should discourage the use of hydrocanic acid gas for fumigating grains, because it is such a virulent poison and so dangerous to handle; because it does not seem to be able to penetrate masses of closely piled grain in sufficient quantities to kill all of the insects; and because of its liability to injure the germinating power of the seeds if the grain is moist and damp as it is apt to be.

The usual proportions of ingredients for generating hydrocyanic acid gas are: One ounce of potassium cyanide 98 per cent. pure, one ounce of commercial sulphuric acid, and three ounces of water to 100 cubic feet of space. Apparently the best substance for fumigating stored grain is carbon bisulphide. It should be used somewhat stronger, however, than has been generally recommended. Not less than two to three pounds should be used for every one thousand cubic feet of space in a tight bin, and the fumigation should be continued at least 48 hours. Moreover, the temperature, at the time of fumigation should be from 65 to 75 degrees Fahrenheit. Probably most of the failures with carbon bisulphide may be attributed to low temperatures during the fumigation; to loose and open bins from which the gas escapes before doing its work; and to the use of too small quantities.

GLENN W. HERRICK.

NATIVE LIFE IN PANAMA.

Conditions and Customs of the Canal Zone.

I will try to give you an idea of Panama natives and their mode of farming, although I have never been back in the interior more than one or two miles, but have been across the Isthmus many times. The natives are very lazy and live a hand-to-mouth existence. The way they raise corn is to burn the land over, cutting the trees down with a machete, which is a large knife about two feet long and three or four inches wide, make holes in the ground with a stick, drop in the seeds, and do no cultivating at all, save cutting the jungle grass with a machete. The jungle grass is very coarse, and grows six feet high.

There are many kinds of fruits growing wild here, such as plantains, bananas, papayas, oranges, limes, alligator pears, cocoanuts, bread-fruit and pineapples. The natives have no horses at all. The way they go to market is to pack whatever they have in a basket that holds about two bushels and carry to the city of Panama on their backs, and one poor lene hen under their arm. Eggs are done up in corn husks, two in a bunch, and tied between, so the eggs do not strike together, but can be seen.

Some feed their poultry grated cocoanuts; their grain is ground on a flat stone by another smaller stone in the hands to crush the grain, which is corn or rice. Up the coast and from the many islands in Panama Bay the natives bring their produce to the city in sail boats. In place of potatoes they raise several kinds of yams, roots and coarse sweet potatoes. Sugar cane is raised here to some extent, mostly to make rum, although the West Indians on the canal work buy it to eat raw.

In the cities of Panama and Colon the Panaman merchants have the clothing and dry goods stores, banks, hardware, liquor stores and hotels, and this class as a rule has a good education. The shops and grocery stores are run mostly by the Chinese. Spanish is spoken here by all the natives, but it is claimed there are 72 different nationalities here, and some of them talk with their hands and feet as well as their mouth.

Law and justice in Panama is very funny. If one is arrested for a crime they put him in prison and forget him for a year or two, then give him a trial, sentence him for the time he has been in, and give him his freedom. On the Canal Zone we have a fine police force mostly of Americans. Every American working on the canal or Panama railroad gets room furnished free with electric light, if single; if his family is with him he gets house, electric light, wood and coal free; house is furnished except linen and dishes. The ships will be passing through the canal soon. The great work is drawing to a close, and the forces are being reduced slowly but surely, but there will always be work here for skilled workmen. A. H.

BACK TO THE LAND IN PANAMA. FIG. 56.

CAMP OF INDIANS IN PANAMA. FIG. 57.

THE LARGE AND SMALL FARM.

From time to time you print sketches that seem to boom the small places, and disparage the large farms, as if it was almost a crime to run a large farm. I take issue with that. I say let a man seek his own inclination; it depends on the man. Some men would not be suited to a large farm and others could not make a living off a small place. If a man wants to pay more for 10 acres of land, a small house and barn, and no timber, than he would for 160 acres of good land, fine large buildings and a fine timber lot, enough fuel to last a lifetime, I am willing; that is the way the small farms generally sell. In speaking of the little farm costing as much as the large farm, I refer to an actual fact. A little place of 10 acres 2½ miles from Cortland, sold for $3,800, and a fine farm of 160 acres five miles from Cortland, good buildings and timber, sold for $3,000. I could mention other instances. The man on the small place is handicapped at every turn: he has no fuel or building and fencing material; he has so few acres he can afford to buy hardly any machinery. He can of course raise truck crops; then they must be peddled out in small quantities, and I think most emphatically it is harder work to garden than it is to raise big fields of grain and potatoes on a large well-equipped farm. I had all the gardening I wanted when a boy; it was weed and thin and transplant, and every bit was back-breaking work. It had to be peddled from house to house, and all the sour looks I used to get. A trucker is no more welcome than an agent. If the trucker is so thrifty and diligent as to sell as much as some large farms, what of it? He paid as much for his little place: he hasn't any brag coming. Raising truck crops has been boomed so much I want to have my little say against it.

If a young man is ambitious, likes machinery and would rather do things on a large scale, by all means don't discourage him. The work isn't nearly as hard on a large farm, well equipped with big machines, as on a small farm without implements. I know a young man who farms 218 acres; not alone, but he does the brunt of it alone, only hiring in sugaring a month and again in haying a month. The rest of it he does practically alone. He cuts about 100 tons of hay and raises 60 acres of grain alone. I mean he does the plowing and putting in crops alone, and crops are put in better than some of his neighbors' who only have a small acreage. He is making good too, and does not hurt himself either. When he buys a machine it is the best, and takes a wide swath. Of course every man doesn't like machinery, and such ought not to handle it, but you don't want to talk small farm trucking and poultry to this man. We will take raising grain, for instance. My friend can either ride or walk on every tool he uses, from plowing till the grain is tossed from the self-binder, no hard work about it, and the big fields are an inspiration.

In raising onions, beets or turnips it is all back-breaking. My back used to ache till I could see stars. I might say a good deal more in favor of the large farm. There is the timber lot to work in when you cannot farm, also the sugar bush and the big pasture for stock. There seems to be quite a tendency to find fault with the big farm, but I say it depends on the man; the kind of work he likes is more than half. DAYTON L. PHELPS.

New York.

THE BACKBONE OF THE NATION.

The cartoon shown at Fig. 55, that occupied a goodly position of the front page sheet of a daily paper, appealed mightily to my sense of humor, and furnished me food for a little serious reflection.

Hasn't the American farmer a look of satisfied opulence? You would not imagine that a care or a worry ever disturbed the serenity of his mind. His occupation is the reaping of bountiful harvests. He simply sows the seed and sits down to wait while a benevolent Nature does the rest. No troublesome stocks to bother him. Failing banks affect him not; there is no rush and hurry to catch the elevated or the commuter's special. His life is one long dream of contentment and restful ease.

I see nothing in the picture to suggest in any manner the toil of long days in the field and vicissitudes of weather and storm. No sign of the tense strain to get the seeding done ahead of the season, nor of the anxious watching and praying for the rains that come not. Nothing to remind one of the scanning of crop reports that record as vital a meaning to many a farmer as the stock ticker does to the city man. Lastly, can you distinguish anything in the picture that would suggest he was pocketing just 35 per cent. of the value of his most bountiful harvests? The ten billion, I imagine, represents his 35 per cent. If so, there is just so much more that is rightfully his, for the other 30 per cent. ought to distribute his crop to consumer.

The picture portrays just about what is usually handed to the public by the average daily paper. It pictures the farmer as the one class of society on easy street, painting with glowing colors a pleasant and picturesque life close to Mother Nature's bosom; many times covering up or grossly misrepresenting facts, treating the farmer's claims with ridicule and sarcasm. When the farmer tries to bring about legislation to rectify or ameliorate some abuse or open favoritism, the papers as the mouthpieces of big business and politics, pat him kindly on the head and say, "Now you are a good chap and we are fond of you, but as to this making of laws, why you are a farmer and cannot expect to know much about it, and what is best for your interests and the country's. Trot along back to your seed time and harvest and we will attend to the running of this our glorious nation." And in the past the farmer trotted happily back, such was his faith in his brothers, and such has been the custom of the tillers of the soil since the beginning of the ages.

If we but look to our histories we will learn that in but few instances in the history of nations has the agricultural element had a voice to any great extent in the affairs of state. In the past and to a greater or less extent in the present in some countries, it is true that by reason of his isolation from the commercial and political centers, he has been ill fitted to take an intelligent or perhaps we will say an effective part in political activities. For all the picture aroused my mirth, the title, "The Backbone of the Nation" is a great and glorious truth. It is the farmers who make all other kinds of prosperity possible. It is because we as a nation have produced a riotious abundance of agricultural products that the accumulation of our nation's wealth has been so phenomenal. It was the farmer who was directly responsible for the building of our many New England factory towns. By his energy and pioneering ability the farmer blazed the trail and demonstrated the possibilities in the different sections of the country, to be followed by our railways and other means of transportation, and by the development of other sources of wealth.

Taking any of our big industries like the steel combination or our railroad systems, they are dependent for the greater part directly upon the farmer. With all of these facts so evident that any one can see them, if he but investigates a bit, is it not a shame that the farmer has to crawl and beg for, as privileges, what really are his rights? What is the reason for this state of affairs? It is because he does not realize strength and power as a class. He does not understand that all agricultural interests are related, and should each help the other.

You see I am a farmer, and believe in the natural strength of those of my class. In times of national stress and adversity it has been the farmer who has sturdily taken his stand by what he believed to be right. It is the farming population that has been the regulating governor by which the machinery of state has been in many cases kept from running wild and by being what he has been, and is, can rightfully be called "The Backbone of the Nation."

Vermont. LEE F. HATCH.

NEW YORK STATE AGRICULTURAL SOCIETY.

The convention of the New York State Agricultural Society was held in Albany last week. This convention represented the comprehensive needs of the farm interests of the State at this time more completely, we think, than the current needs were ever before represented by a convention of the State. The close of the convention coming so close to our time for going to press, our references to it this week are necessarily brief. We shall refer to it at more length later on.

At the close of the convention resolutions were adopted recommending a law to establish the grading of apples; to oppose the single tax on land; to oppose additional appropriations for State forestry schools and secondary agricultural schools until a comprehensive plan for this kind of education is adopted by the State; to revise the commission law; to restrain the commission merchants from dealing in consigned products, and requiring them to keep records of sales for the inspection of shippers; to favor the organization of a land mortgage bank as a revision of the saving and loan association laws of the State; to create a food and market commission; to conserve the food products of the farm; to establish grades and measures; to encourage and assist in the establishment of local markets, to preserve the wastes by cold storage and canning factories; to furnish information as to general markets; to direct shipments to markets where they would find the best demand and best prices.

A feature of the convention was the interest and enthusiasm manifested by Governor Glynn in farm needs and particularly in the subjects of his especial adoption—farm credits and farm markets. He delivered a stirring address on these subjects to the convention, and the day after the sessions closed, he threw wide open the doors of the Executive Chamber and invited the farmers to come in and discuss the agricultural needs of the State with him. They did so fully and without reserve. As Secretary Giles of the State Grange put it: "The farmers had reason on that occasion to congratulate themselves." Heretofore, he said, they had come knocking for admission at the door of the Executive Chamber. For the first time in the history of the State, farmers had found on that occasion the doors wide open and a ready welcome and sympathy within. The Governor did most of the listening and the farmers did the talking, but before departing they were assured of an executive recommendation to the Legislature for their needs, and an executive influence in an effort to get what they wanted from the Legislature.

One of the most important results of this executive conference, and indeed one of the most important results of the whole convention, was the appointment of a committee instanter by the Governor, at the suggestion of the interests affected, to begin at once an investigation of the sale and distribution of liquid milk in the city of New York. In this committee the producers, the consumers, the dealers, the State Department of Agriculture and the City Board of Health, will be represented. The object will be to determine a fair price for producing and a fair price for distributing milk, and the sum of the two will be a fair price for the consumer. For 30 years this subject has been agitated and discussed. Heretofore the dealers have refused to take any part in a disinterested effort to determine a fair price for this important and necessary article of food. They have now wisely expressed a willingness to do so, evidently conscious of the fact that it would be done with or without their aid.

The officers of the Society elected for the ensuing year are as follows:

President, John J. Dillon, New York; vice presidents, first district, Mrs. Julian Heath, New York; second district, Ezra Tuttle, Eastport; third district, Gilbert Tucker, Albany; fourth district, C. Fred Boshart, Lowville; fifth district, W. R. Smith, Syracuse; sixth district, Samuel Fraser, Geneseo; seventh district, James W. Wadsworth, Jr., Mt. Morris; eighth district, Senator Frank N. Godfrey, Olean; ninth district, Dr. G. H. Davison, Millbrook; secretary, A. E. Brown, Batavia; treasurer, Harry B. Winters, Albany; executive committee: A. Denniston, Washingtonville; J. A. D. S. Findlay, Salisbury Mills; William Church Osborn, Garrison; Dr. Thomas F. Finegan, Albany; Franklin D. Roosevelt, Hyde Park; E. A. Van Alstyne, Kinderhook; George W. Sisson, Potsdam; Senator T. B. Wilson, Hall; F. W. Sessions, Utica.

Poplar Near Well.

I have planted a small poplar about 25 feet away from my well. I am informed that in time the tree will be injurious to the well. We use the water for drinking purposes. Is there any danger? If so I will take up tree and plant elsewhere. Would an English walnut thrive there? It is gravelly soil, red shale. Would an English walnut be injurious? I judge it would make about as much shade as the poplar. J. F. F.

Ottsville, Pa.

In my opinion the danger of your well ever being injured by the roots of any tree standing at a distance of 25 feet away, is so remote it is hardly worth while considering. In my boyhood, a large yellow willow stood very much nearer my father's well, perhaps not over 10 or 12 feet away. I assisted in cleaning the well two or three times, and to the best of my recollection, no roots were ever inside the wall, which was constructed of boulders. The willow is naturally a moisture-loving tree, but for some reason, this particular tree seemed very well satisfied with its roots outside the well. If the feeding roots should in time (perhaps a long time) extend to, and through the wall of your well, they will be near the top, and will be nothing more than a bunch of fibres which cannot possibly do any injury to the well, and can easily be removed at any time. If the Winters are not too severe in your section for the English walnut, it is certainly much to be preferred to any poplar. I think your soil will be all right. As a rule the walnut will readily adapt itself to almost any kind of soil that is fairly good and not too wet. K.

Growing Early Tomatoes.

I have a seed catalogue in which the Earliana tomato is given as an 80-day and the June Pink as a 70-day tomato. If the claim as to the time required for these tomatoes to reach maturity is true, I presume it is only when the seed is sown in the open in their natural season. I know growers, who raise Earliana, who sow the seed in the greenhouse about February 20, and do not get tomatoes at the earliest before June 20. This is about 120 days after the seed is sown. Would they not come on almost as early and be much finer and more productive plants if they were started April 1 and kept growing vigoronsly from the start? Would not the addition of a fertilizer rich in phosphoric acid and potash to the soil (in the cold frame) to which the plants are first transplanted, hasten the blossoming and the setting of the fruit?

Cleveland, O. H. N.

Tomato plants started early in the greenhouse or hotbed always require a longer time for their development and ripening of fruit than those started later in the season when the days are longer and warmer. The tomato plant must have a certain high temperature to ripen its fruit, and when the heat that it requires is lacking, growth will be retarded, and the time of ripening the first fruits may be lengthened to many days beyond the time required under favorable conditions. Plants started early under glass, seldom ripen their first fruits under 120 days, and the time is more often extended to 130 to 140 days from the time of sowing seed, and the application of fertilizers will not do very much if anything toward hastening the time. As a rule the earliest hot-bed plants do not begin ripening their fruits much before the middle of July.

I am doubtful if any variety can be made to ripen fruit under 100 to 105 days, from the time of sowing seed even under the most favorable conditions, at least not in the northern section of the country. It may be accomplished in Florida in 70 to 80 days, under certain very favorable conditions, but surely not in any of the Northern States. Some growers make a practice of planting the seed in hills where the plants are to stand, for second or main crop. The hills are prepared same as for cucumbers; about the middle of May a dozen or so seed are planted in each hill. When the plants are four to six inches high, all but the most promising one is removed. K.

Successful Fruit Growers

The largest, most successful fruit growers buy their trees from us year after year. They have found that our stock is the best adapted to this soil and climate. Back of every tree and plant we sell is our 31 years' reputation. This record protects you from risk.

KELLY BROS., WHOLESALE NURSERIES, 124 Main St., Dansville, N. Y.

The Home Acre.

Value of Lime.

On page 11, in answer to M. M. W. of Nyack, N. Y., you recommend using one ton of slaked lime per acre? Do you mean water-slaked or air-slaked? I am in about the same fix as M. M. W., with this difference. My top soil is sand from two to four feet deep, then clay, but it stands drought well. This field of 20 acres has been cropped for 25 years, and the soil is getting thin. I am quoted prices of pure lime at $5.60 per ton and hydrated lime at $7.30. The field is seeded to Winter rye now. Would it pay me to turn this rye under next Summer, and follow your directions to M. M. W. at the cost of lime as quoted above? It looks to me like a very expensive way to build up this field. As I figure, it will cost about $13 per acre. D. W. T.

Quaker Springs, N. Y.

We do not quite see how you figure the cost of $13 unless you count the value of the rye. How can you strengthen this soil at less cost? Figure the price of manure or fertilizer needed to make this soil productive. The rye will add humus and the lime will sweeten the soil and help its texture. If you will sow buckwheat and clover after the rye, let the buckwheat die down and the clover grow, you will improve still further. On the other soil mentioned the top soil had been taken off and we advised slaked lime. In your case on sandy soil the ground limestone will answer. We referred to air-slaked lime though there is no difference unless too much water is used.

Barren Plum Trees; Hog Manure for Apples.

1. I have some Quackenboss plum trees which fail to set fruit, although they blossom full every year. What is the best thing to do to make them produce a crop? These trees have been pruned and are making a good growth. 2. I had about 250 barrels of Baldwin and Northern Spy apples this Fall. They were light colored—the Baldwins were covered with bitter-rot, and the Northern Spy were covered with smut. I have been fertilizing with hog manure. These apples were poor keepers. W. B.

Weston, Mass.

1. It is quite probable that the plum trees do not set their fruit because of lack of pollination of their flowers, for there are some varieties that are noted for this fault, the Quackenboss being one of them. If this is the cause the remedy would be to graft a few of the highest branches with some other variety that will pollinate the bloom, and almost any two that bloom at the same time will cross-pollinate each other.

2. Stimulating the growth of fruit trees with very nitrogenous manures, like the hog manure mentioned, is apt to cause the fruit to be late in maturing and of poor color, and this is probably the trouble in this case. The keeping quality is also impaired by it. The smut and bitter-rot can be kept down by spraying intelligently and frequently.

H. E. VAN DEMAN.

Handling an Asparagus Bed.

In answer to J. B., Concord, Mass., page 4, I would like to give a little description of an asparagus bed I worked in during 1912 and 1913. When this asparagus bed was bought by the present owner the Fall of 1912, it had been cut for two years. It had had a coat of New York manure every year, which cost $2.15 per ton at the station three miles away. It also had a top-dressing of fertilizer. This bed did not improve as it should until this present owner took charge. Then there was a change in the fertilizer. We cultivated the bed until about August 15, then we sowed one-half bushel of Crimson clover seed to the acre, plowed early in the Spring and sowed 200 pounds of muriate of potash, and 800 pounds of acid phosphate to the acre. The second Spring after this way of fertilizing this bed it was fine. Some was cut that measured 6¾ inches around at the ground level. This method is increasing in Southern New Jersey, and is giving fine success. D. E. W. S.

Port Norris, N. J.

Budding a Persian Walnut Tree.

I have a young tree of Persian walnut which has been injured so that the limbs on one side are gone. Can I put in a bud on this injured side, so as to develop new limbs and thus even the top of the tree? H. M. W.

New York.

It is, of course, perfectly possible to bud the tree on the side where the branches have died off, but it is not a thing that a man usually succeeds with the first time he tries it. For methods see Bulletin 254, Bureau of Plant Industry, U. S. Department of Agriculture. But I should think that there might be a good deal of difficulty in getting such buds to start. It would certainly be necessary to cut back the tree severely to get the new buds to start and that cutting alone ought to start up dormant buds already present on the tree. My own idea as to getting such a tree into shape again would be to cut off everything except one vigorous shoot and then to cut this back to three or four buds so as to start a new head. It is desirable, probably, to have nut trees headed higher than fruit trees. I do not know the cause of the injury that H. M. W. refers to. It may be due to lack of vigor from various causes, or it might be due to what has injured many walnut trees in this part of the country, namely the walnut weevil, which bores into the new growth of the trees and kills it. It can readily be detected by examination, and the borer found in the injured stem during the growing season. W. C. D.

THE BOOKSHELF.

THE SUBURBAN GARDEN GUIDE, by Parker Thayer Barnes. This is a handy little book discussing both flowers and vegetables for the home garden, with planting tables and calendar, pruning and spraying table, fertilizers, etc. While described as a "suburban" book, it will be very helpful in the farm library, for there is often a tendency to ignore the small garden operations, because every effort must be devoted to field crops. Published by the Macmillan Company, New York; 147 pages, price 50 cents.

VILLAGE IMPROVEMENT, by Parris Thaxter Farwell. This is a useful book for the home, school or village library, and will be found especially helpful where a neighborhood is beginning to realize that beauty is a valuable asset. In addition to distinct and specific advice regarding the home and its surroundings, planting, streets and roads, schools, public buildings, clubs and improvement societies, there is an extensive list of publications dealing with such subjects, and a discussion of boys' and girls' clubs. The book is illustrated, and so interesting, as well as instructive, that it should be widely read. Published by Sturgis & Walton, New York; price $1.00.

BRIDEGROOM: "Didn't I look like a fool when I was at the altar rail?" Best man: "No; but any one could see that you were not yourself."—Winnipeg Telegram.

William P. Stark Nurseries

William P. Stark

By ordering direct from nurseries, you save 30 to 50 per cent agents' commissions. You get selected, pure strain stock—healthy, Ozark Mountain-grown trees. Propagated by experts, under the personal direction of Mr. William P. Stark. And doubly guaranteed to be true to name.

J. H. HALE Peach Wonder—Outclasses Elberta on every point. ½ to ⅔ larger; higher colored; firmer and finer texture; practically fuzzless skin; round shape for shipping and preserving; hardier in wood or bud; brings 50 per cent higher prices than Elberta; creating a sensation everywhere.

Save ½ No Agents Buy Direct

Box 20, Seneca, N. Y.

SPECIAL

Low-headed Two-Year Baldwin Apple Trees

We have pruned thousands of Baldwin apple trees to *very low*, perfect heads, just as they should be in the orchard. These trees are larger and straighter, and have bigger and more fibrous roots than average trees on the market.

They are started, or headed, as they must be to bear early and to yield the heaviest crops. You can get as good trees by planting our best Berlin-grown one-year stock and pruning them into perfect shape as they grow, but these special two-year trees save you one season's work and twelve months' waiting.

Such Trees Never Were on the Market Before.

Heretofore two-year apple trees were trimmed too high in most nurseries. You can't easily buy low-headed two-year trees anywhere else. Budded from bearing orchards, grown at Berlin, hardy anywhere, stocky, low-headed, these trees will make fine orchards quickly. Fruit growers who know, will recognise the value of these ready shaped, older trees. The big pruning job is over; they require less work and less expense in their care; they average earlier in bearing; they catch the wind less, and they have more fruiting wood, hence yield bigger crops.

Our 1914 CATALOGUE tells how we grow trees so well, gives planting plans and directions, and is full of information. Write TODAY for it, and tell us about your planting plans.

EVENTS OF THE WEEK.

DOMESTIC.—The large new dam of the West Virginia Pulp and Paper Co., at Dobbin, W. Va., broke, Jan. 15, letting loose a body of water 50 feet deep, seven miles long and with an average width of more than two miles, which swept down the Stony Creek valley thirty feet high. Warnings of the approaching flood sent the residents of small towns along the river scurrying to safety in the hills. Officials estimated that property along the path of the flood had been damaged to the extent of $200,000. To this was added thousands of dollars' worth of logs carried away by the water.

After a preliminary hearing attended by many oil producers and refiners the Oklahoma State Corporation Commission has issued an order fixing the retail price of kerosene at eight cents a gallon in certain territory in western Oklahoma. The retail price formerly ranged from 15 to 20 cents a gallon. This is said to be the first time in the history of the oil business in the United States that State officials have ever fixed the price at which kerosene should be sold to the public. The penalty for the violation of the commission's orders is a fine of $500 and a jail sentence.

The four officers of the steamer Gregory, who risked their lives by jumping into the sea on January 4 to rescue six men adrift in a lifeboat from the sinking Oklahoma, were presented with gold medals Jan. 16, by the Life Saving Benevolent Association or New York. They are Captain William Trow Aspinwall, Richard Henry Buck, chief officer; John Sydney Williams, second officer, and Frederick David Roberts, third officer. The society also voted to present 238 medals to the officers and seamen on the 10 vessels that took part in the rescuing of passengers and crew of the Volturno, which burned at sea in October, when 115 lives were lost. The medals will be presented only to persons who took actual part in the rescue work. They will cost $4,300.

After hearing hundreds of personal appeals and reading letters and petitions bearing more than 2,600 names, Justice Davis in the Supreme Court, Criminal Term, New York, Jan. 21, sent to State prison for not less than one year and nine months and not more than three years and eight months David Kalhofer and Max Swersky, convicted of horse poisoning. Kalhofer was president of the Horse Owners' Protective Association and president of the Columbia D. K. Ice Cream Company. Swersky was his business partner. It was shown at the trial that the two hired for $150 Nigger Friedman's gang of horse poisoners to kill eight horses owned by a Brooklyn business rival.

The international convention in London called to provide regulations for greater security at sea has provided for the following precautions: Ice patrol of the Atlantic passage under control of the United States Government, better equipment of vessels with wireless telegraphy and a new code of signals, regulation of speed during thick weather, double bottoms for passenger steamships in addition to watertight compartments, stronger construction of all steamships, an improved system of lighting, the prevention of fire at sea, the best life saving apparatus available and the requirement of thorough and frequent inspections, with constant drilling of crews for emergencies. After the rules of the convention go into force every steamship of the fourteen signatory nations will be obliged to carry enough lifeboats, rafts or their equivalents, to accommodate all persons on board, including members of the crew. Elaborate as the new code is, it assumes that no ship is unsinkable. As Lord Mersey, the president of the convention, said in his closing address, no matter how vigilant commanders might be, there would always remain the possibility of "a serious and even totally destructive accident."

FARM AND GARDEN.—F. M. Jones of Clinton, N. Y., has purchased Spring Farm Pontiac Cornucopia, a Holstein Friesian bull, for which he will pay $15,000 to Colvin Deshane of Richland, N. Y. This is a new record price for a young bull. The purchaser of Spring Farm Pontiac Cornucopia recently sold to Stevens Brothers at Liverpool, N. Y., the cow Pontiac Lass for $10,000. Pontiac Lass is the mother of the bull for which Jones now pays $15,000.

The mid-winter meeting of the Michigan State Horticultural Society will be held in Benton Harbor, Mich., Thursday and Friday, February 5 and 6, in the auditorium of the First Baptist Church. The State society will be the guests of Berrien County Horticultural Society, which numbers over 200 members. For further information, address J. Pomeroy Munson, president, Grand Rapids, or Robert A. Smythe, secretary, Benton Harbor.

Midsummer weather for 10 days has brought out such numbers of grasshoppers in Hamilton county, central Texas, that the State Department of Agriculture was appealed to, Jan. 19, to assist in preventing the insects from destroying crops.

Indian Agent J. F. Smith, of Chase, British Columbia, reports that in his work the past year has been a most encouraging one. The first exhibit made by the Chase and Shuswap Indians at the New Westminster fair was eminently successful. In wheat and oats they won first prizes in competition, not against Indians merely, but against the whole province. The Spence's Bridge Indians won a similar success in certain classes of fruit. The wheat and oats from the Shuswap reserves were included in the exhibit sent by the Government to Chicago. In the quantity of produce raised the year shows returns that are not insignificant. On the local reserves there was baled for selling as much as 600 tons of hay, while the grain crop harvested amounted to 1,500 tons.

The annual convention of the Connecticut Vegetable Growers' Association will occur in Hartford, February 4, at Foot Guards Armory in connection with the second day's meeting of the State Pomological Society. The principal speakers will be Dean R. L. Watts of the Pennsylvania Agricultural College, and Stephen F. Willard, the veteran seedsman. For further information address David S. Kelsey, secretary, West Hartford, Conn.

PRESIDENT'S MESSAGE.—President Wilson read to Congress, Jan. 20, his promised address on the subject of legislation designed to curb the supposed monopolistic tendencies of modern industrial corporations. Nearly all of the members of the Senate and House were present. The address was well received and was indorsed in unusually candid terms by members, regardless of political affiliations. Following are President Wilson's recommendations for curing the trust evil:

1. Effective prohibition of interlocking directors of great corporations—banks, railroads, industrial, commercial and public service bodies.

2. Powers to be conferred on the Interstate Commerce Commission to superintend and regulate financial operations by which railroads in the future may get the necessary capital for development and improving transportation facilities.

3. Supplementary legislation to make the Sherman law more explicit.

4. Creation of a trade commission which shall be a clearing house of information to help business to conform to the law and at the same time investigate and report to the Attorney-General on violations.

5. A law prescribing penalties for individuals who are responsible for unlawful business practices.

6. To prohibit holding companies and to restrict the voting power of individuals who may hold shares in numerous corporations.

7. Allowing private claimants to found suits for redress against unlawful combinations under the Sherman law upon facts and judgments established by Government suits and providing that the statute of limitations against such claims shall begin to run from the date of the conclusion of the Government suit.

The message delighted the conservatives in Congress, irrespective of party, but brought some disappointment to the extreme radicals, who considered the address too temperate. In Wall Street and in financial circles generally the President's programme produced a reassuring effect, which was reflected in the stock market.

COMING FARMERS' MEETINGS.

Tennessee State Horticultural Society, State Nurserymen's Association, State Beekeepers' Association, Nashville, Tenn., January 28-30.

Forty-first annual meeting, New Jersey State Board of Agriculture, Trenton, N. J., January 29-30.

Farmers' Week, State School of Agriculture, Canton, N. Y., January 26-31.

Ohio Corn Improvement Association, Mansfield, O., January 27-30.

Western New York Horticultural Society, Rochester, N. Y., January 28-29-30.

Farmers' Week, Ohio State University, Columbus, Ohio, February 2-6.

Connecticut Vegetable Growers' Association, Foot Guards Armory, Hartford, February, 4.

Midwinter meeting Michigan State Horticultural Society, Benton Harbor, Feb. 5-6.

Sixth National Corn Exhibition, State Fair Grounds, Dallas, Texas, February 10-21.

Granite State Dairymen's Association, Concord, N. H., February 12.

Massachusetts Agricultural College, Amherst, ten-weeks' Winter course, January 6 to March 13.

Stump Land is LOAFER Land!—

Says the U. S. Government

Pull Out the Stumps with the

HERCULES All-Steel Triple Power Stump Puller

Stump land is *loafer* land. Loafer land is *failure* land—*robber* land. It pays you *no return for taxes*—it takes away half the realty value of the land—robs you of big money you *should* get and *could* get if the stumps were out of your fields.

$100.00 for Every $1.00 Invested

Pull out the stumps! It means $100 profit for every dollar you invest. It means a profit of $1,281 the first year and $750 every year after, on 40 acres. It enables you to pull any stump in 3 to 5 minutes—an acre or more of stumps a day—*roots and all!* It means a big profit from *renting* your Hercules to neighbors or in doing *contract* stump pulling for others. It enables you to make money moving houses, barns, big boulders, etc., but the biggest profit comes from clearing your own land.

A Remarkable 3-Year Guarantee

The Hercules is the *only* All-Steel Stump Puller made. We know its strength. We guarantee it for 3 years against the breakage of any casting, *whether the fault is yours or the machine's.*

The triple power feature gives the Hercules *more pull* than a locomotive. You can make it single or double power also. It is low-down in construction—self-anchored or stump-anchored. No other stump puller, or method of clearing land, can even *compare* with the Hercules.

Look at the Photos in This "Ad"

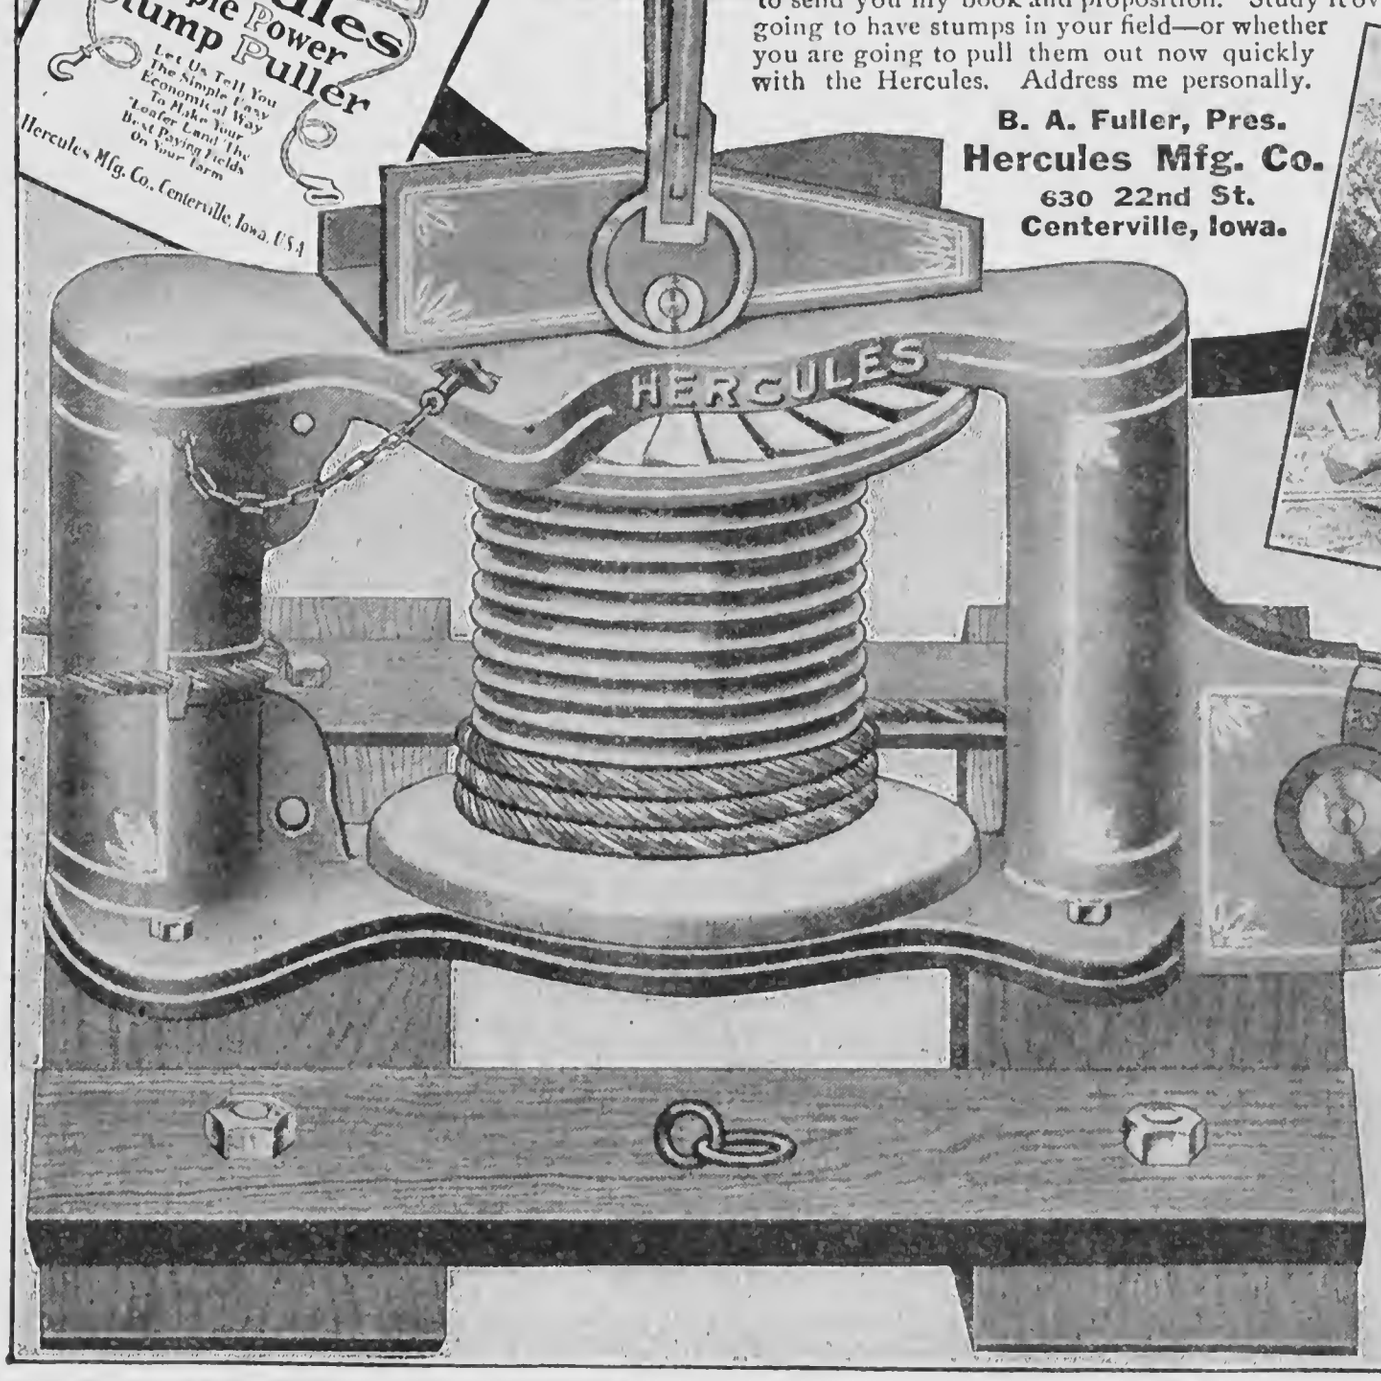
There are many more in my fine book—also many letters from owners of Hercules Stump Pullers.

Let Me Send You My New Free Book and Special Price Offer at Once!

Send me your name and address. I know my book will interest you. I know you will be glad to get my low price—a price that is astounding thousands of men who are writing in now for this very same offer. We have only a limited number of Hercules Stump Pullers to sell at this remarkable introductory price, so send the postal now. Let me tell you facts about stumps that will surprise you. I'll show you what crops to raise on the virgin soil where the stumps stood and lots of other information that I haven't room here to mention now.

Just Write a Postal. Simply your name and address on a postal is all. I want to send you my book and proposition. Study it over carefully; then decide whether you are going to have stumps in your field—or whether you are going to pull them out now quickly with the Hercules. Address me personally.

B. A. Fuller, Pres.
Hercules Mfg. Co.
630 22nd St.
Centerville, Iowa.



NOTICE!

Grand Prize Yellow Strand Wire Rope Used on Hercules Pullers!

It is this *Yellow* strand wire rope that won *first prize* at St. Louis Exposition *proving twice as good as next best cable.* It is this *Yellow* strand wire rope that is being used by the *U. S. Government at Panama on the real important work* of building the canal. And experts say this *Yellow* strand rope is one of the big helps that will enable Uncle Sam to complete the canal a whole year before expected.

Don't forget—it's the *Yellow* strand cable that is showing such wonderful strength—the *Yellow* strand rope that is beating *all others* on every test put to it, under *all* conditions all over the world. *And it is the Yellow* strand wire rope that is used exclusively on the Hercules Stump Puller—*not a green strand, blue strand, white strand or red strand*—but a YELLOW strand—don't forget that—and don't let any unscrupulous person or company confuse you.

Farm Management.

FIGURING THE PROFIT ON COWS.

Three years ago Banks invested $3,500 in the dairy business in a town of 3,000 population. He bought a small farm near the town for $2,000, and spent the balance for 20 head of cattle at an average cost of $60 each, and for wagon and horses for delivery, bottles, milk cooler, and other equipment necessary in his business. He gave his personal attention to the work, from about 3 a. m. to 9 p. m., and was assisted by his wife, an 18-year-old son, and a 16-year-old daughter when she was not in school. At the close of three years he found himself in debt to about every tradesman in the town who had trusted him, and "up against it" good and rocky. He wailed and railed at his lack of success, and condemned everyone who had advised or assisted him in his business.

A friend approached him and said: "Jim, how much does it cost you to produce a quart of milk?"

"I don't know."

"How much does it cost you to sell a quart of milk?"

"That's a fool question to ask."

"How much does it cost to keep a cow a day?"

"How can I tell?"

"What percentage of your sales do you fail to collect?"

"Oh bother! What are you driving at?"

"Just this; you don't deserve to succeed. You haven't learned your business yet. You are a business menace. You are the type of man who tears down the business of another without building one for yourself.

"Be just with yourself. Get your figure facts before you. Before you can succeed you must know all these things and more. You must keep before you the costs so that you know what your farm produces, and what it earns. And when you sell your farm produce to your dairy business, deal as if you were dealing with a stranger. Find what your overhead is—what the limit is where a cow ceases to be profitable—you have fine-looking cows—that gets you nothing—you're selling milk, not cows.

"Why Jim, when you pay $25 a ton for hay to feed a cow that eats two tons of hay a year, you can realize that your cow costs you a dollar a week for hay. And add to that 35 cents a week for grain. And add in her proportion of 'overhead' such as interest, taxes, insurance, depreciation—you realize that a dairy cow is a good cow for only four years, you have to charge off one-fifth her cost to depreciation every year—and the bottles and wear and tear on wagon, the keep of your delivery horse, the wages you pay to deliver must all find a unit value somewhere that you can charge against——"

"What is a unit value?"

"A basis for your fixed charges. You have 20 cows. Against these 20 units you have to charge all your expense and credit all your revenues.

"For instance, your interest on $3,600 at six per cent is $216. Your taxes are $40. Your insurance is $10. Your hay bill is $600 a year. Your grain bill is $200. Your wage bill for your son is $300; for your wife $300; for your daughter $150. You yourself should be put on a salary, say $600. Any one of you would earn more than this working as you do now, for some one else. Your depreciation of cattle is $240. Your breakage of bottles and depreciation of equipment is fully $50. Look a fact in the face, so it won't rise up later from a business shroud and look you in the face. Just off-hand, without counting tickets and bottle caps, and advertising, and sickness and the thousand and one leaks that you must consider, nor the loss from customers who don't pay, you can see that your cows have got to earn $2,706 a year, or $135 and better a year apiece. And that reduced to quarts of milk at six cents is 2,250 quarts per year, or between six and seven quarts of milk per day.

"And so by getting your figure facts right, Jim, you find that a cow that gives six quarts or less of milk per day is a financial loss besides the labor she causes. Now if while a cow is fresh and for two months she gives 12 or 14 quarts of milk a day, and then for two months more nine or 10, and then for two months seven or eight, you will see that for the two months that she gives five and six and the two she is dry she is a loss, and if you will get your figure facts right you will find that you can afford to keep her at $40 and buy a fresh one at $60.

"And you will know that your loss of collections is confined within certain families, and that by cutting off the trade of same, and going after others you will save yourself and your business.

"What you need, Jim, is a system, so that you can figure and reason and analyze without getting tired. You had better have 12 cows, fresh, and a system, than your 20 cows as you are now.

E. G. WHITMYRE.

Grow This Berry for big profits and sure yields. It is hardy and wonderfully productive, coal Black and very large; almost as thick through as long. In luscious flavor it surpasses by far all others I have ever grown. In my long experience with this berry its canes have never been affected, even slightly, by orange rust or other fungus disease, and I believe it immune to them.

THE "JOY" BLACKBERRY

brings joy to all who grow, sell or eat it. It is immensely profitable to the market grower, and "a joy forever" to the amateur gardener. The canes are of ironclad hardihood, need no staking, and are literally loaded with fruit every year. I know this berry thoroughly, and willingly stake my reputation upon it. Illustrated catalog replete with cultural instructions, free to everybody. Established 1878. 200 acres. Quality unsurpassed, prices low.

STRAWBERRIES from August to November from Superb and other new seedlings. Plants for sale by the originator. Circulars free. SAMUEL COOPER, Delavan, N. Y.

TWO NEW YORK COUNTIES COMPARED

I was greatly interested in that letter of Mr. Lindberg on page 1348, in which he writes about farm conditions in an adjoining county, the high elevations of which are visible a few miles to the southwest of here. This is a rolling to hilly section. Northern Schoharie soils are glacial till, mostly from decomposed limestone, are as a rule dark brown in color, hillsides and all, and underlaid with a lighter colored, fairly porous subsoil, and belong to the Ontario series; do not lack lime, as Alfalfa succeeds if given any chance whatever, in fact it is beginning to appear as a volunteer plant; and naturally these are good wheat and corn soils. Southwestern Montgomery County lies lower, is moderately rolling and even more free from stone than northern Schoharie. Soils on uplands are glacial till, derived partly from limestone, partly from Catskill gray shale; are slightly lighter in color, and heavier texture than the Ontario soils. They belong to the Mohawk series, and are fairly well supplied with lime, as good stands of Red clover are obtained.

The greater part of the soils of Otsego County are glacial till, and residual soil, derived from Catskill red and gray shale, light in color, rough, stony, and as Mr. Lindeberg says, needs lime. They are poor corn and grass lands, have a hardpan underneath, that means wet, cold land in Spring, and a very dry one in Summer if season is dry, and equally too wet in a wet one; a soil in which even were climatic conditions favorable, corn as a grain crop would at least be a doubtful proposition, and for the same reason it is not a good clover or Alfalfa land, as both are apt largely, roots and all, to lie on the surface in the Spring. But the worst of these Volusia types of soil in Otsego County is their natural infertility. If all other conditions are met, viz., good culture, good drainage and sufficient rainfall, corn on an unfertilized sod would not yield more than 10 to 20 bushels per acre, and on much of that soil type no grain would be produced at all. In northern Schoharie on the other hand, soil is darker in color, very much warmer, better drained, and naturally fertile. The thick growth of Sweet clover and Kentucky Blue grass along roadsides attest this.

This type of soil, with good culture and sufficient rainfall, will produce 50 bushels of corn to the acre without fertilizing on sod, and all kinds of small grains do equally as well in proportion. But great as is the contrast in the quality and condition of soils, that of climate, in so far as it affects the agriculturist, is if anything greater still, in fact if all other conditions were equal, this factor alone would in a series of years, make all the difference between success or failure. Note what Mr. Lindberg writes, about what freezing his corn had to contend with, both in June and the beginning of September. But I think another factor, which he did not mention, was more detrimental than that, and that was the low average temperature and the relative great degree of cloudiness, as well as a soil so light in color that it does not absorb the sun's rays and warm up enough for corn, which is a tropical plant, and no amount of added fertility, or good culture can ever overcome this handicap. To show, however, what a difference of climate really exists between the two sections following is the record of mean and minimum temperatures, rainfall and number of clear days for the growing months of 1913, as appears in the monthly weather review of the United States Weather Bureau for Sharon Springs, as recorded by myself, as cooperative weather observer, 821 feet above tide in valley bottom of Sulphur Creek, and at New Lisbon 1,234 feet above tide in Butternut Creek Valley, about six or seven miles west of where Mr. Lindberg is located.

Mean monthly temperatures of 1913:

	May. Deg.	June. Deg.	July. Deg.	Aug. Deg.	Sept. Deg.
Sharon Sprgs.	55	64.7	70	68.3	59.5
New Lisbon..	50.7	59.7	65	63.5	55.8

Minimum temperatures, 1913:

	May. Deg.	June. Deg.	July. Deg.	Aug. Deg.	Sept. Deg.
Sharon Sprgs...	23	30	41	40	25
New Lisbon....	18	25	36	35	20

Rainfall, 1913:

	June. Inches.	July. Inches.	Aug. Inches.
Sharon Springs....	2.05	2.82	2.37
New Lisbon.....	2.05	2.31	2.10

Number of clear days:

	June.	July.	Aug
Sharon Springs.....	20	15	13
New Lisbon	17	9	9

The mean monthly temperatures of 1913 were almost exactly normal, although minimums for June and September were abnormally low. Following is the record of 1912 at New Lisbon: 25, 28, 32, 32 and 27 degrees for May, June, July, August and September, respectively. Here there was no damaging frost after April 21, 1912, till September 30, when it was general throughout the State. Note the low monthly average at New Lisbon and the greater degree of cloudiness, which is very retarding to vegetative growth. This may be "almost like Denmark," but I do not think frosts every month of the year any advantage in making a "good living" from a farm. Nor are such unfavorable climatic and soil conditions likely to be of much inducement to the younger generation to remain on the farm. Hence all the young people "have gone to town," as Mr. Lindberg says.

The average date of last killing frost from 11 years' record in the Spring, is May 7, and first killing frost in Fall, is October 6 in this valley, giving 153 days of frostless weather, or long enough to ripen Leaming corn usually. Farms sell from $20 to $75 per acre here according to location and improvements; good farms well located with good buildings can be bought from $30 to $50 per acre. An Otsego County farmer came here in 1909, selling his 50-acre farm there for $800, and commenced to work a nearby farm on shares, buying it four years later for $5,500, or $47 an acre, and had it all paid for in Autumn of 1911, besides adding during that time at least $1,000 worth of personal property. This man has had to pick very few stones, has spent no money for lime, although he has good stands of Alfalfa, and his fertilizer bill has not averaged $50 per year; his sales since 1906 will average more than $3,000 per year. Perhaps such as this is one of the reasons why Otsego County needs good farmers. The case just mentioned was general farming. To show what can be accomplished here with special crops I will mention another instance.

A farmer located on the hills on south side of Sharon Springs, but in the village limits, rented three acres of hillside, adjoining his land, sloping to the west, and set it all to Marlboro raspberries; third year after setting, it yielded over 4,000 quarts of berries per acre. Returns exceeded $1,900, and this without any manure whatever, and only 250 pounds of 2-8-10 fertilizer that year. He pays $22.50 rent for the three acres. In 1909 he purchased a four acre lot, abandoned to weeds and brush, lying about half a mile from the other mentioned, paid $50 per acre, cleared it up and set to fruit the next year. His sales in 1913 from this was more than $1,000, and the greater part was just coming into bearing, and every small fruit grower knows what kind of a season 1913 was in central New York. I am positive that since that land was originally cleared from forest it has never had two tons of fertilizer all together, and probably not 25 tons of manure. This grower now has in all stages of growth, 20 acres red raspberries, 6 acres currants, five acres blackberries, two acres black raspberries, three-quarter acre grapes, 10 acres apples, 2½ acres cherries, two acres pears and one acre plums. His soil is Ontario fine sandy loam, of which the United States Soil Survey says "is of high agricultural value," yet as in this case selling for $50 per acre within the corporate limits of a village that has nearly 4,000 people to feed in the Summer season. Farms on this same soil type within two miles of the village with fairly good buildings have been sold for $25 per acre. To those who are anxious to find a home where nature will richly reward energetic, intelligent effort, old Schoharie offers opportunities second to none, for here are together at our door, the great markets of the East, combined with the fertility of the West. WM. M. KLING.

Windswept Soil.

"In many instances," said Dean Jardine, "land has been plowed for years with a disk plow, to a depth not exceeding three to five inches. Sometimes the disk harrow was the only instrument used in preparing the seedbed for wheat. Straw has been burned annually. Such land, of course, is soon in very poor physical condition, and under such conditions windstorms of 20 miles an hour have been known to do a great deal of damage."

This report comes from Kansas, where windstorms often do great damage to soils by blowing the fine particles away before the seed is planted. This loss is heaviest in those level States where the wind has an unmolested range, but it is often troublesome in other localities. In some cases it seems better to leave the soil rough or ridged, to break the force of the wind somewhat. A cover crop like rye helps in trouble of this sort as its roots run all through the soil and hold it together. S. S.

GASOLINE POWER.—A recent issue of THE R. N.-Y. contains some opinions and advice as to horsepower for a gasoline engine for farm work. I believe six horse-power was the highest mentioned. It appears to me that a farmer should first determine what kind of work he wants to do with it. I have a 12 horsepower that runs 15 different machines. One of these is a mill that grinds corn on the cob with other grains, and I have to feed very carefully to avoid being stuck. Another is a large baling machine; still another that hoists a quarter ton of hay or grain to the mow. It should be known that gasoline horsepower is not to be depended upon to equal same rating of steam, and that a six power of one maker, might prove to be no better than four of another.

New York. FRANK HYDE.

Here is the Territory Where DAYBREAK ROCK PHOSPHATE Has Made Good

In each of the States shown on this map we have shipped "Daybreak" Rock Phosphate in car-load lots and a most persistent follow up of our customers has not found one who has not profited from his purchase.

Here are the crops which have been materially and profitably increased by the use of Rock Phosphate

Corn, Wheat, Oats, Clover, Potatoes, Silage

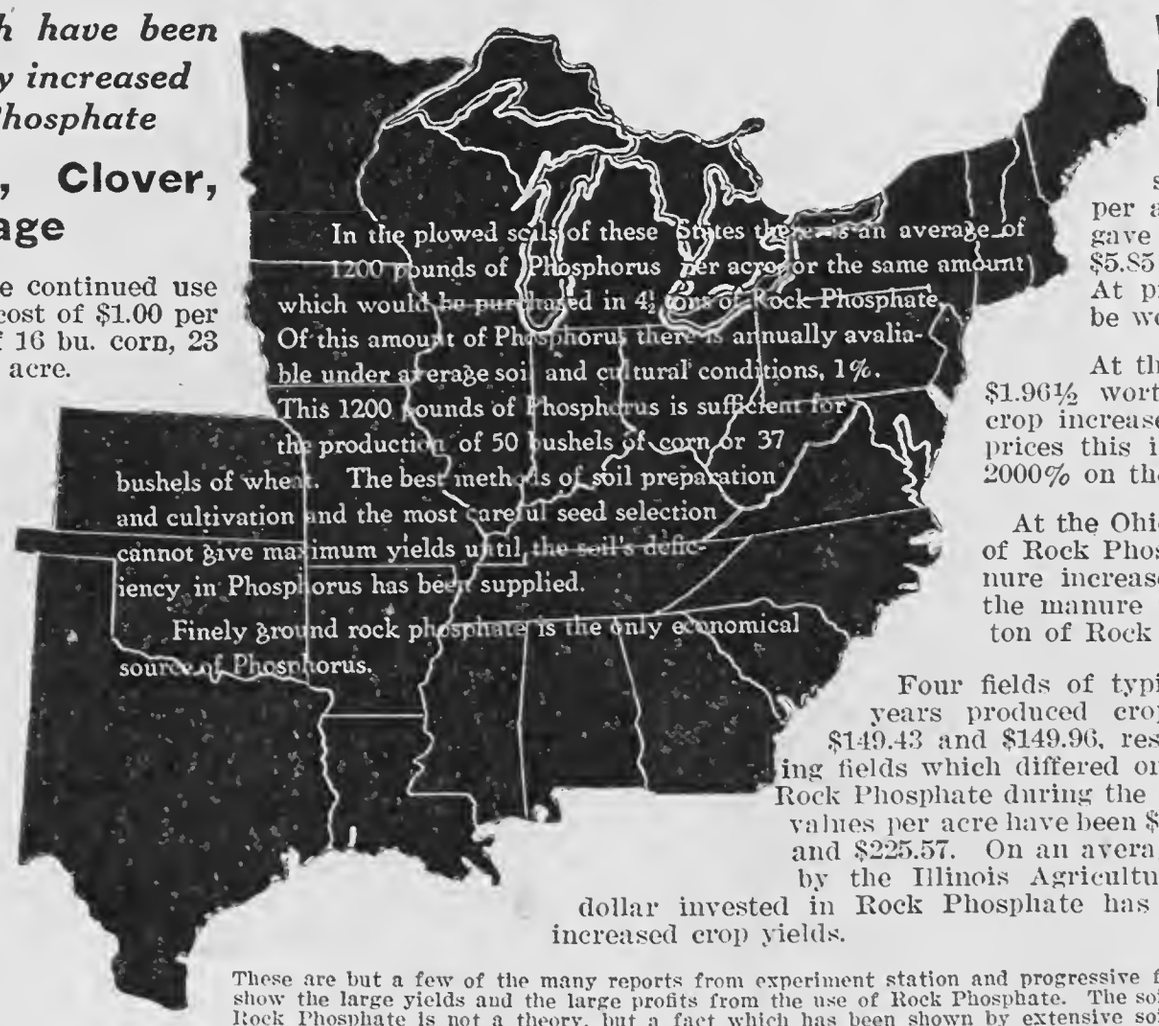
On a typical corn-belt farm the continued use of Rock Phosphate at an annual cost of $1.00 per acre has given increased yields of 16 bu. corn, 23 bu. oats and one ton of clover per acre.

In a recent issue of Breeder's Gazette there was reported an increase of 25 bushels of wheat per acre from an application of 600 pounds of Rock Phosphate.

Increased yield of 20 bushels of oats and one ton of clover per acre from 1,000 pounds of Rock Phosphate is reported in Prairie Farmer.

At the University of Wisconsin the use of Rock Phosphate gave an increase of 47 per cent in the potato yield.

The Ohio Farmer reports an increased clover yield of 2820 pounds per acre at the Ohio Experiment Station. The Rural New-Yorker reports 2652 pounds more of clover per acre from the use of lime and Rock Phosphate than from the use of lime alone. Prairie Farmer during 1913 gave reports from the use of Rock Phosphate on clover in five counties of Illinois. On an average Rock Phosphate doubled the clover yield. One of America's best known Jersey breeders reports an increase of 8 tons of silage per acre from the use of 500 pounds of Rock Phosphate.



What Rock Phosphate Has Done in Dollars and Cents

In a twelve year test at Pennsylvania Experiment Station $1.05 per acre invested in Rock Phosphate gave increased crop yields valued at $5.85 as an average of the 12 years. At present prices these crops would be worth $9.

At the Maryland Experiment Station $1.96½ worth of Rock Phosphate produced crop increases valued at $22.11. At present prices this increase would show a profit of 2000% on the Rock Phosphate investment.

At the Ohio Agricultural College 15c worth of Rock Phosphate added to each ton of manure increased the crop producing value of the manure 75c per ton. On this basis one ton of Rock Phosphate is worth $37.50.

Four fields of typical corn belt land have in ten years produced crops value at $148.75, $151.30, $149.43 and $149.96, respectively On four adjoining fields which differed only by two applications of Rock Phosphate during the ten year period the crop values per acre have been $229.37, $221.30, $229.20 and $225.57. On an average of all tests made by the Illinois Agricultural College, each dollar invested in Rock Phosphate has given $5.00 in increased crop yields.

These are but a few of the many reports from experiment station and progressive farmers which show the large yields and the large profits from the use of Rock Phosphate. The soil's need for Rock Phosphate is not a theory, but a fact which has been shown by extensive soil surveys and analyses by state and nation. The use of Rock Phosphate is not an experiment but a well established system of fertilization which is increasing the bank accounts of thousands of intelligent farmers and enabling them to make their soil permanently productive. Get the facts and you will get the profits. Fill out this coupon and mail it to us today.

Federal Chemical Co., Columbia, Tenn.

What Helped the Pumpkin Seed?

Reading an artiele this morning on the "Survival of the Fittest," recalled the interesting experience I had last season with pumpkins. Two years ago, in a potato patch, where we had used stable manure, I noticed a volunteer squash or pumpkin vine which was so very vigorous I left it through the season, and it bore several of the finest pumpkins I had ever seen. From the largest of these I sowed the seed and last Spring planted 10 hills, which were highly manured and cultivated. The season was very unfavorable and not one of the many pumpkins compared with the one which bore the seed used, but of the seed from the others, which was thrown onto the manure pile as they were used, two plants came up in my Lima beans, and were allowed to grow, bearing 10 pumpkins, fully equal to the best of last years' crop. One of these vines, actual measurement extended 30 feet in each direction, and was a beautiful sight with its large and beautiful fruit. The question with me now is, how are we to find out which of these seeds is the best? One plan I have is to sow the seed in the Winter with fresh manure, and expose it to frost, planting the manure in a trench in the Spring, and then transplanting whatever may come up. I find no difficulty in transplanting either squash or pumpkins. Can any of your readers suggest a better plan? A. C. W.

New York.

I believe every tiller of the soil has at one time or another (and many of us many times) had similar experience as recorded in the above letter, and wondered why it was that these volunteer pumpkins grew so much better, and bore more and finer fruits than vines grown from seed saved and planted in the regular way. I have many times given the matter much thought, and have delved through many pages of gardening literature in quest of information on the subject, but have never been able to find anything in print that shed any light on it.

I have long believed that it is entirely due to the stratifying of the seeds in the manure. By reason of the protecting covering of manure, they were preserved in what might be termed the green state, the meats retaining all their original moisture, thus preventing any possible weakening of the germ that might result from drying out, thereby preserving every grain of vitality originally stored within the germ. I have planned for several years to prove or disprove the correctness of this theory, but always neglected it. I am now sorry I failed to carry out my plans for this experiment. If I had done so I might now be in a position to explain the matter fully. I am glad you intend to do some experimenting along that line. I shall probably do likewise this year, if opportunity affords, and I hope by next year we shall be able to give some light on the question. If the phenomenon is due to the stratifying of the seed, it is not likely the manure is of any benefit to the seed, other than to preserve the germ in its full vigor. If that is true, loam or sand used in the same manner as practiced for the stratification of tree seeds will answer quite as well or better, and be cleaner and more satisfactory to handle. Perhaps some other reader of THE R. N.-Y. can shed some light on this interesting question. K.

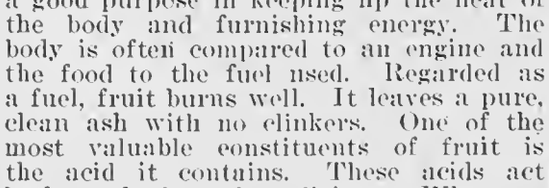
HORTICULTURISTS OF OHIO IN COUNCIL.

PART I.

The forty-seventh annual meeting of the Ohio State Horticultural Society, and the Fifth Annual Ohio Apple Show, were held in the City of Cleveland Jan. 20 to 25 inclusive. The first session was a sort of "get-together" gathering, planned in part by the Agricultural Commission and the officers of the society. All of the active members of the Commission were present, the president, Mr. A. C. Sandles, presiding. Dean H. C. Price of the State University, stated that nine-tenths of the apples consumed in the City of Cleveland came from outside the State of Ohio. There was no good excuse for this. Apples used in Ohio should be grown in Ohio. The conditions for their growth were as favorable as in any other State, and the quality was as good. There was enough good apple land in Eastern and Southern Ohio to raise apples not only for her own use but for the whole United States. The fact that apples were shipped into Ohio, often from great distances, made the retailers' price to the consumer in our cities so great that many were obliged to go without this wholesome fruit. The man in the city has much to learn from the thoroughly trained country horticulturist, while many an old fashioned country fruit grower can learn much from the city man who engages in orcharding. The average city man believes in thoroughness and does not hesitate at expense when he sees that one dollar invested will yield several fold. The city man is more teachable. He likes to be told what to do to increase the size, brighten the color and improve the quality of his apples. He knows the virtue of the really good, while the old-time fruit grower is satisfied with a mediocre product. The intensive orcharding of the city man on a large scale is doing the farmer orchadist a lot of good.

Dr. H. W. Wiley gave an eqnally interesting and instructive address on "Fruit as Food and Medicine." He said among other things that anything may be regarded as a food for man that builds up tissue, repairs waste, and supplies the body with heat and other forms of energy. Food should keep that complicated machine, the human body, in good working condition. Medicine is something for repairing the machine when out of order. Fruits are not especially rich in nutrients, but they serve a good purpose in keeping up the heat of the body and furnishing energy. The body is often compared to an engine and the food to the fuel used. Regarded as a fuel, fruit burns well. It leaves a pure, clean ash with no clinkers. One of the most valuable constituents of fruit is the acid it contains. These acids act both as foods and medicines. When we are well we eat fruit because we enjoy it—it tastes good and acts as a food. When we are ill fruits by their cooling quality help to correct a feverish condition. They are also useful as antiseptics, destroying injurious germs that may have found lodgment in the body. The apple is one of the best of fruits and should form a part of our everyday diet.

The annual address of President E. J. Riggs was short but inspiring. Ohio, in spite of flood and frost, is a great horticultural State. What is most needed is a spirit of mutual coöperation and helpfulness among all who raise fruit. Mr. R. A. Gill of Ottawa County gave a good account of the evolution of the mechanical fruit grader. As far a peaches are concerned the best grader now in use seems to be well nigh perfect. Apples, owing to their variation in shape, and the difference in their vertical and cross diameters, are more difficult to grade than peaches. Yet many of the larger growers are finding the best apple grader a great saving of time and expense. These graders or sizers do better work than can be done by hand and do not injure even tender-skinned fruit. Eggs may be graded by the best of these machines. Apples and peaches may be graded at the rate of one hundred barrels or more an hour. W. R. LAZENBY.



Some Growing Children

are under size—under weight.

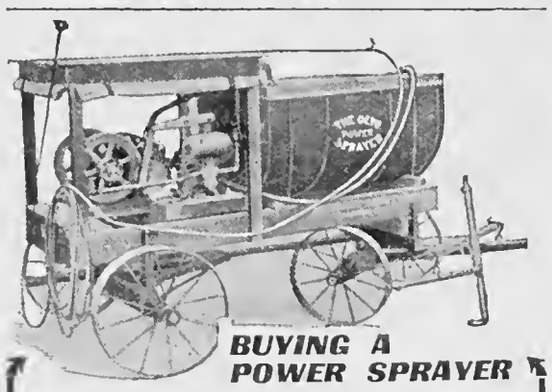
Some grow tall and thin, others are backward in studies—pale and frail—*improper assimilation is usually the cause.*

If your children are not rugged and ruddy and rosy—bubbling with energy and vim at all times,

you owe them **SCOTT'S EMULSION**—*nature's concentated nourishment to build body, bone, muscle and brain.*

CHILDREN NEED
SCOTT'S EMULSION
TO PROGRESS.

Trade-Mark SCOTT & BOWNE, Bloomfield, N. J. 12-153



BUYING A POWER SPRAYER

Is like buying a piano—you must be sure you are getting the right machine because *if* it is the right *sprayer*, it will last a lifetime. The

DEYO POWER SPRAYER

is a thoroughly practical machine that has stood the hardest working test of a dozen years. It runs perfectly on any ground, in any temperature. Has DEYO engine, direct connected pump, perfect agitation, and clear thoroughly seasoned Cypress tank. Write us, or our nearest factory selling agent, for illustrated booklet, telling all about Deyo Power Sprayers and Deyo Engines.

DEYO-MACEY ENGINE COMPANY
22 Washington St., BINGHAMTON, N. Y.

J. S. Woodhouse, 189-195 Water St., New York
Richardson Mfg. Co., Worcester, Mass.
Kendall & Whitney, Portland, Maine

LITTLE GIANT SPRAYERS

LIGHT RIGS
WITH LOTS OF POWER

We make a complete line of Sprayers for Orchard, Field and Vineyard, both Hand and Power Types, designed and built under the personal supervision of a practical man who has learned what to build into his machine and what to leave out by operating machines in the orchard and field. Little Giants are built to stand up under hard work, and so constructed that they put the spray where you want it. They combine maximum power and strength with minimum draft weight, so that they won't kill horses on rough, heavy ground.

LITTLE GIANT ORCHARD POWER SPRAYERS

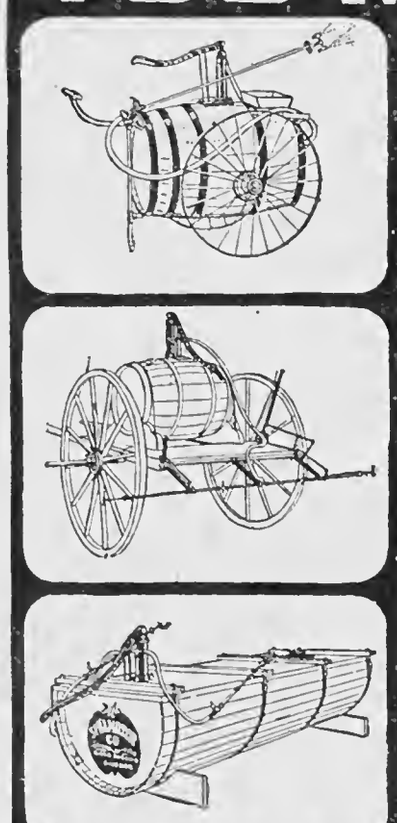
are built in two sizes with tanks of 200 gallons, and 100 gallons capacity. Both are equipped with a special pump of our own make, especially powerful, easy working, and so simply constructed that every part is accessible. Our pump has many practical features like pet cocks through which you can draw off all the water and prevent freezing.

THE PUMP WITH THE CLUTCH

is a little Giant feature. By throwing out the clutch the pump may be stopped without stopping the engine or interfering with agitator. It's a great advantage to be able to crank the engine without having the pump attached. You can also mix your solution thoroughly before starting spraying. Little Giants are giving extra satisfactory service to many growers. It will be worth your while to write for our catalog and prices.

W. C. AKINS MACHINE COMPANY
976 INSURANCE BLDG., ROCHESTER, N.Y.

YOU MR. FARMER



need the ***Spramotor*** to realize from your farm or orchard, all that it can make for you—doing without it is costly—THOUSANDS OF DOLLARS are lost yearly through ravages of bugs—pests—germs and blight upon plant life.

The increased yield in field, garden and orchard crops at a cost of a few cents an acre for spraying will return DOLLARS in extra profits.

You can pay for your equipment and BANK MONEY in one season from the increased yield you will get by using the ***Spramotor***. After caring for your own crops

MAKE BIG MONEY

spraying those of your neighbors and friends.

The hand power ***Spramotor*** sprays an acre of potatoes effectively in 30 minutes—if done three times in growing season often more than double the yield.

The President of the Michigan State Horticultural Society says, "I have never seen so perfect an equipment for spraying."

G. W. Maurer, New York, writes, "The ***Spramotor*** I bought of you last season was put in test with others and PROVEN TO BE THE BEST in every way. In 2½ hours the ***Spramotor*** did better and as much work as could be done in 11 hours with the next best."

FARMING

without this dividend paying farm efficiency machine is like a carpenter trying to build a good house without the necessary tools. There is a ***Spramotor*** built expressly for your needs.

Write for free catalog and proofs of what it can do for you.

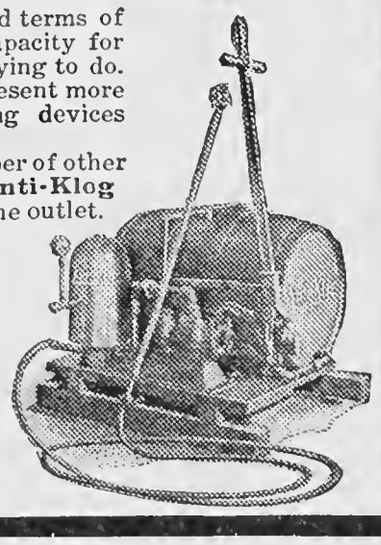
SPRAMOTOR CO.
112 Erie St., Buffalo, N. Y. 162 King St., London, Ont.

SPRAY with an ANTI-KLOG

They give the highest efficiency through long hard terms of service. There is an **Anti-Klog** of the right capacity for those who have much and those who have little spraying to do.

They spray better—spray better longer—and represent more downright sprayer value—than any other spraying devices manufactured.

Ease of operation, simplicity, strength and a number of other individual features appeal to every user. The **Anti-Klog** nozzels make it very difficult for any mixture to clog the outlet.



Guaranteed for 5 Years

You are absolutely protected when you buy an **Anti-Klog,** as each one is sold under an unqualified guarantee of 5 years' service.

Send for our new free catalog and give your dealer's name. You should now make preparations for spring spraying.

ILLINOIS METALS COMPANY
2412 West 22nd Street CHICAGO, ILL.

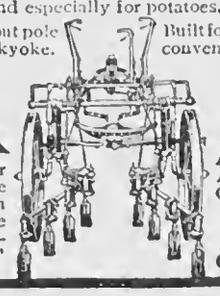
Potato Profits

A certain loss in potatoes has been turned into a profit of $30 an acre by more and better cultivation. Keeps the soil mellow, retains the moisture and kills the weeds.

IRON AGE Riding Cultivators

Carry every possible adjustment of points, gangs, wheels and frame to care for any row crops in any soil and especially for potatoes.

All steel but pole and neckyoke. Built for wear and convenience.



See them at your dealers and write us for booklet on "Two-Horse Riding and Walking Cultivators."

Ask also for Iron Age Farm and Garden News.

"Friend" Sprayers Make Good—THERE'S A REASON

GEORGE D. KITTREDGE, Mont Vernon, N. H., 1-14-1911.

GENTLEMEN:—The power sprayer has been received in good condition; would say that it is a beauty and has excited the admiration of all who have seen it. I consider I made absolutely no mistake in purchasing a "Friend." Thanking you for prompt shipment and wishing you every success with the best machine on earth, I am, etc.

"FRIEND" MFG. CO., - Gasport, N. Y.

Pure Canada UNLEACHED HARDWOOD ASHES

"THE JOYNT BRAND."

The best, cheapest and most lasting fertilizer on earth. They are nature's plant food to build up the land and restore it to its original fertility. Potash, Lime and Phos. Acid are contained in ashes. The potash is an active caustic potash and the lime is a vegetable lime which is the purest and strongest form of lime. The Joynt Brand Ashes are the best by test. Prices and information cheerfully given.
Address JOHN JOYNT, Box 297, Lucknow, Ontario, CANADA

FOR SALE—**LIME-SULPHUR SOLUTION**

at manufacturer's prices. Buy from me and save money. F. H. ENGLEHARDT, Manager Friendship, New York

When you write advertisers mention The R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page. : : :

The Home Acre.

Matured Crop in Orchard.

On page 1297 is a picture (Fig. 509) of a peach orchard, whose grain matured in it, also where the grain was turned under early before maturity. In 1912 I saw an apple orchard filled in with peaches. There were three rows in the center of this orchard that did not get plowed until the Crimson clover matured. This caused the two rows of trees in these places to stop growing and get very yellow. This orchard was in clay soil. The remainder of this orchard was moist, and where it was not plowed was nearly as hard and dry as a cement walk. It is a great drawback to young trees to let any cover crop such as rye or Crimson clover mature in it. D. S.
Port Norris, N. J.

Winter Pruning of Fruit Trees.

Is it wrong to prune young peach trees this time of the year? P. D. A.
Meriden, Conn.

It is not wrong, but hardly wise. Better wait until March. By that time the danger from killing of the wood will be over. Should you cut more there may be killing later and in such case you would have to prune again.

Sorrel in Lawn.

My lawn four years old, otherwise well seeded, is being overrun with sorrel. I suppose it needs lime. Will you advise me whether to use burnt or ground limestone and what quantity for about 75x 100 feet? M. M. A.
Bernardsville, N. J.

Evidently this soil needs lime, but we doubt if you will find that applying it to the surface will prove satisfactory. You should use 300 pounds of slaked lime on this area of lawn, but the only way to obtain best results is to work the lime *into the soil*. Of course this cannot be done without spading up and reseeding. The lime will kill out some of the sorrel, but not all of it.

Soil-binding Growth for Henyard.

My chicken pens are on quite a slope, the earth is sandy gravel. The fowls keep the vegetation all picked off. In the Spring, especially, it gullies badly. Can you advise me of any planting that the hens will leave alive and that will check that wash? I last Spring put out three filbert bushes as a feeler. The hens cannot reach the top branches and I am hoping the roots will hold the earth (though the pens would require a much larger number planted). What can you advise me regarding this or any planting? VILLAGER.

It is doubtful if you can get any crop securely started in these yards, unless you keep the hens out for at least six months. No crop can start while the hens are actually at work. We will turn this over to our readers for experience.

Seeding Timothy on Quack Grass.

I am a green hand at the farm business, and would like to know whether Timothy and clover seed sown over quack grass in early Spring, April or May, will come up in time to be cut in July or August? I am bothered a good deal with quack grass, and that grass by itself makes it hard to sell at a fair price. I thought by doing this it might help out until I get my farm in shape.
Buffalo, N. Y. R. K.

As we understand it, you think of seeding Timothy and clover on land that is foul with quack grass. You will be disappointed, for the chances are that the quack grass will come in and crowd out the Timothy. We would not seed down until the quack grass has been killed. Better sow fodder corn in drills and give thorough culture, or seed thickly to oats and Canada peas, and follow with a heavy seeding to buckwheat and rye.

Mixing Lye and Sulphur.

While making soap I accidently spilt some strong lye water on some powdered sulphur. In a short time the sulphur seemed to dissolve, so I then took equal parts of lye, sulphur and water and mixed them up and added a little heat. The mixture soon changed to a reddish transparent liquid that instantly mixes with water without separation. Diluted 50 to one it has a yellow appearance, and feels quite greasy to touch (very similar to soluble oil sprays). I sprayed a small apple tree with some 25 to one and two peach trees with 50 to one, and will wait for results. Do you think this mixture will make a good spray, and what tree ailments will it be good for?
Somerville, N. J. E. L. C.

The mixture which you obtained is a sodium sulphide, similar in some respects to the soluble sulphur now being manufactured. We cannot, of course, without having the mixture at hand, give any idea as to its strength. If good for anything it should affect San Jose scale and fungous disease organisms, but as you have no exact means of determining its strength you would better go slow with this until it has been well tested.

Homemade Oil Spray.

I have a few trees to spray and wish to use "soluble oil." Will you tell us how to prepare fish oil and others to make them soluble in small quantities? S. B. R.

A bulletin issued by the Connecticut Experiment Station, Storrs P. O., tells in detail how to do this. We do not advise you to try it on a small scale. It looks easy, but you will not know just how strong it is when the job is done, and you may have a mixture that will injure your trees. This is work for an experienced hand, and we would rather buy one of the guaranteed brands of oil than try to mix a small lot.

Tar for Tree Wounds.

Is tar as a covering for wounds made in pruning trees objectionable? It sticks and covers better than white lead. C. E. S.

We prefer to paint the tree wounds with a mixture of pure lead and oil. The tar varies somewhat in its composition, and we have known cases where it did considerable injury, and to be on the safe side we should prefer the pure paint.

Fight the Peach Borer.

Some of my peach trees are injured. The sap is running out through the bark at the base of the tree, what can I do?
New Jersey. F. L.

The substance you find at the bottom of the tree is not the sap running away, but a gum caused by the wounds made by peach borers. Scrape away this gum from the bark, and you will find that it contains little pieces of wood like sawdust. You will find a hole in the bark, with a tunnel running down between the bark and the wood toward the root. With a sharp knife cut down this tunnel, do not work across the trunk of the tree, and at the bottom you will find the borer. This is a white insect with a black head. Dig him out and kill him. You will probably find several borers in the same trunk. This insect in the form of moth lays its eggs in midsummer at the base of the tree. These eggs produce tiny borers, which work down toward the root of the tree, keeping up their work until very cold weather, and resuming it in the Spring. When they have completed their growth the following year, they spin a cocoon around themselves, from which later on a moth appears to lay the eggs and go through the same performance. The peach borer is a worse insect for us to handle than the scale. Various washes are proposed to paint over the trunk of the tree, but the most effective way is to dig them out with a sharp knife, or a crooked wire. This should be done in the early Fall, and once again in May.

Lantern in Hotbed.

On page 37 one of your correspondents requested information as to how to give warmth to a small hotbed, inasmuch as he could get no fresh manure for the purpose. In the answer you gave him an excellent method, but one which would require considerable expense. I had exactly the same difficulty last year as did your correspondent in getting the necessary warmth, and I purchased two large lanterns (for 75 cents each) and placed at each end of the hotbed, giving just a little space between two of the frames for air. The result was perfectly satisfactory. Seed was planted about the middle of February and was ready for transplanting at the usual time.
New York. WM. J. YOUNGS.

R. N.-Y.—Be careful to give enough air.

MOTHER: "Now, Willie, put away those drumsticks. Don't you know your father has a headache?" Willie: "But, ma, when I was going into the parlor with my drum, he told me to beat it."—Boston Transcript.

The
Mapes Fertilizer
Company

A Business Characterized by Stability and Progress

Under the Same Family Management
for Three Generations

NOT only have the Mapeses continued successively in the business for three generations—grandfather, father and son, but the Lanes, who have been associated with the Mapeses from the start, show the same identical record—grandfather, father and son.

Could there be a better guarantee than this family management, with the element of family pride deeply involved, that everything has been done and will continue to be done to make the Mapes Manures as good as the present knowledge of fertilizer science permits for the crops for which they are intended?

The Mapes business had its inception in the scientific research and experiments of Professor James J. Mapes, and scientific research and experiment, coupled with the most exact practical experience, have been the dominating factor in the Mapes business to the present day.
